$5 May Save You $500 or $5,000!

You work hard for the dollars you save. Properly invested they can be made to work hard for you. But they must be properly invested.

If you feel the need of a guide to show you how to invest your money to bring you the biggest return consistent with safety; to show you how to avoid the pitfalls of investment; you need THE FINANCIAL POST.
It will give you a personalized investment service. Its articles every week will tell you what you want to know about investing. Its discussion of current business and national problems will give you a new angle on economic and political questions. You will have too all the privileges of the Investors Inquiries Department. You may ask as many questions as you like about your own investment and financial problems—the standing of your broker, and the analysis of particular securities, insurance problems, etc. This service is free to all readers.

Stop losing money on bad investments. Invest $5 now where it may save you $500 or $5,000. Pin a $5 bill to this ad. (or your letterhead), write your name and address and we will send you THE POST for one year (52 issues).

THE FINANCIAL POST 143 University Ave. Toronto

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

130,000 reports on cleaning methods *gathered yearly by* Oakite Service Men

THESE 130,000 confidential reports tell how thousands of plants have lowered their cleaning costs by simplifying and speeding up cleaning operations. They also reveal new ideas about modern equipment and time saving methods that make cleaning more thorough and less laborious. Sixty technically trained Oakite Service Men make an average of 8 visits a day each in all kinds of plants. They study cleaning problems, demonstrate new methods, and correct cleaning troubles. Every man reports every day each visit that he makes.

An office staff of trained engineers and chemists classifies this tremendous volume of data. In tabulated form it is reported back to the men in the field. Thus each Oakite Service Man has the benefit of the experience of all the others. This system, in effect for 14 years, has developed a science of industrial cleaning practice.

Along with this painstaking research in *methods*, our chemical laboratory constantly conducts tests to make sure that Oakite *materials* are the most efficient known to modern science.

You can focus on your own cleaning job all this wide experience by having an Oakite Service Man go over your cleaning methods with you. This implies no obligation whatever. The burden of proof is on us. Our experience indicates that you are very likely to profit by doing this.

May we ask an Oakite Service Man to visit your plant?

Resident Canadian Representatives: Mr. C. P. Murphy, Toronto, and Mr. C. Burgin, Montreal

OAKITE

MANUFACTURED BY OAKLEY CHEMICAL CO. 44 THAMES ST. NEW YORK

While They Wait Your Costs are Rising

Lacing Belts by hand cost one firm $1200 a year too much

This is a story for manufacturers who must reduce their operating costs. It is based on statements by the plant superintendent of one of America's leading silverware manufacturers:

Two $36 Clipper Lacers, used to repair the breaks in 150 belts, cut $1153 a year from the former cost of lacing them by hand. This saving was the result of a 50% reduction of idle man and machine time whenever a broken belt was being laced, together with a 66% reduction in the number of broken belts.

Any workman using the Clipper, can in three minutes, make a tight, smooth, flexible joint that will outlast two, three, and sometimes ten hand-laced joints. The foregoing statement can be substantiated by authentic data obtained from numerous users of the Clipper method—users ranging in size from the Packard Motor Car Company to machine shops and factories operating just a few belts. If you want this conclusive evidence which *proves* that the Clipper method will save you money, a letter will bring it free.

CLIPPER BELT LACER COMPANY

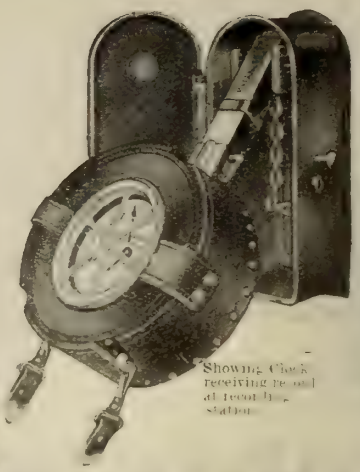
Your Watchman Is Only Human



Showing Clock receiving records at record station

What proof have you that your watchman is "on the job" all the time? How can you be sure he'll be on hand to notice any small blaze that might occur—one of those small blazes that often mean ruin if not caught in time? He's only human, you know. He may mean to do right but—supposing you **knew** he "slipped a round" once in a while—would you sleep easy?

Sure, you'd get your insurance in case of fire, you might even rebuild; but what about loss of production and disorganization in the meantime? Worth a few minutes thought, isn't it?

Let us tell you just how the Hardinge System will **protect** you absolutely. No waiting or other complications, the only tool needed is a screw-driver. It's ridiculously inexpensive, too.

This is what we'll do. We will install the system in your plant for 30 days' trial without suggestion or prompting from us. If it doesn't convince you it's something you can't do without, there's no harm done—all the charges are on us. How about it?

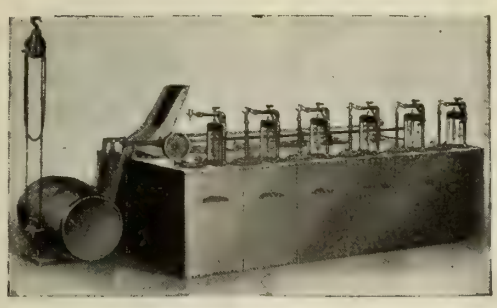
MARK OF ALGOMA OH QUALITY

If interested tear out this page and place with letters to be answered.



"Bill, that chewing gum man has the right idea for oil. You know, he says: 'Sealed tight keeps right!'

"Do you realize, that, since we put in that Bowser equipment to handle oils, our lubrication trouble just disappeared?"

Bowser tanks assure the constant operation of your machines without those expensive shut-downs caused by out-of-service equipment—because the all-metal oil-tight construction of Bowser tanks prevents dirt and grit getting into the oil, robbing it of its lubricating qualities.

Lubrication trouble, thief of time and upsetter of production schedules, can be completely eliminated by Bowser equipment in your plant, just as it has been in hundreds of other plants—names on request, of course! And not only is the oil maintained at its full lubricating efficiency, but all waste and spillage are eliminated—thereby the fire hazard is wiped out.

Booklet C-13 is of vital interest to you. It will be sent upon request. Or, better still, permit one of our engineers to make a survey of your plant—you will find his suggestions worth while if you wish to save money and to increase production.

Effective Co-operation

THE three newspapers you see illustrated here belong to the MacLean Technical Group.

If you are a manufacturer of equipment that can be used in machine shops, metalworking plants, power plants, or foundries, one or all of these papers can give you effective cooperation in increasing sales.

Tell the consumer about your products in the columns of these publications. The men who buy industrial equipment read them. Your products may have advantages over other products of their kind.

Tell the consumer what they are. Create a desire in his mind to buy your lines when ordering from the dealer.

An effective message in MacLean Technical Newspapers will prove effective cooperation for the promotion of sales, and the group you can use to greatest advantage includes:

CANADIAN MACHINERY
AND MANUFACTURING NEWS

POWER HOUSE

CANADIAN FOUNDRYMAN,
AND METAL INDUSTRY NEWS

Canadian Machinery serves the iron and steel and general metal working industries.

Power House serves steam, electrical, water and gas power plants.

Canadian Foundryman serves the grey iron, steel and non-ferrous foundries.

Each of these papers covers their respective fields almost exclusively. They are "Canadian National" in scope and are read by the men you are anxious to reach—proprietors, managers, superintendents, purchasing agents and foremen. Attract the attention of these men with a strong appeal in their favorite technical newspaper—the MacLean service staff will assist you.

Why Don't You Write?

HARDLY a week passes that Canadian Machinery does not receive copies of this paper returned by the postal authorities because of the change in firm names or the address of some whose names are on the mailing list. Sometimes complaints reach us of the non-delivery of mail matter. It is not till the receipt of such complaints or the return of the paper, as the case may be, that we obtain any knowledge of the changes or removals of persons or firms. The adoption of the co-operative spirit on your part by notifying changes would make things a good deal more pleasant for both parties. The MacLean Publishing Co. want their mailing list to be in such shape that they will be able to render the perfect service to their subscribers. There is a lot of valuable trade matter mailed by this company and if you don't receive it—well, the fault is entirely yours.

Mahomet didn't have much luck with his mountain. In reversing a similar order of things Starrett has succeeded where Mahomet failed.

Bringing the Mountain to Mahomet

Often it is easier to bring the work to the micrometer than to take the micrometer to the work. At such times the convenience of a tool like the Starrett Micrometer Caliper Stand is a real time-saver.

When, for instance, frequent reference must be made to a caliper set at a given dimension or when a number of pieces must be made the same size, this tool enables the machinist to work much faster and more accurately, as he has both hands free.

A turn of the winged nut locks both bracket and caliper in place.

Making The Cutter Stand Up To The Work

Maximum Rigidity Essential for Heavy Duty Milling—Interlocking and Staggering of Inserted Teeth—Special Appliances for Performing Heavy Work on Light Machines—Duplex Fixtures

In order to make the cutter stand up to the work it is necessary to give considerable thought to the part on which the operations are to be performed. Full appreciation must be given to the cutting action of the tool so that metal will be removed with the minimum of effort on the part of the cutters. To avoid any tendency of the tools chattering spring in the arbor or work-holding fixtures should be eliminated by providing adequate bearing support for the former and clamping facilities for the latter. Proper rake and keen cutting tools are very essential.

PROBABLY one of the most essential factors in any problem involving the cutting of metal is the need of maximum rigidity of support, both of the work-holding fixtures and the tools that are performing the actual operation of removing the material. Vibration in any form lessens the efficiency of the machine and requires operation at a reduced speed, consequently resulting in a loss of production. Steady cutting under heavy feeds and high speeds is only possible when every tendency to develop chatter has been given careful attention and provision made for its elimination.

A good example of heavy duty milling is illustrated in Fig 1. This job has usually been considered as one best handled on a shaper or on a planer, but the performance of the miller on this particular piece indicates that it can be economically machined by this method, provided proper equipment is supplied for the purpose. The gang of cutters shown in Fig. 1 consists of two large side mills, 14 in. in dia., flanking a pair of inserted interlocking cutters. The surfaces finished in this operation are the outer and inner faces of both flanges and the bevel portion between the flanges. The work is performed at a feed of 11¼ in. per min., removing from 3/16 to 5/16 in. of cast iron from the various surfaces.

It will be seen that the large side mills have the inserted teeth placed in such a way that positive rake is given both to the face and peripheral sides of the teeth. The cutters on the interlocking mills are ground on the periphery only, and the blades are staggered in order to make for smoother action. A feature in the construction of the large cutter heads is the added length on the hub, providing increased bearing on the arbor. The auxiliary steady head extending down from the overhead arm is located to give maximum rigidity to the cutter under the heavy cut. Special clamps are used to allow the cutters to pass completely over the work.

A somewhat unusual operation for a milling machine is that shown in Fig. 2. Here the high-power plain milling machine is adapted to the cutting of wing rails used on ordinary frogs and switches. The material is .70 carbon open-hearth rail steel, and the taper cut calls for the removal of metal from zero to about 1¾ in. at the end of the rail. The smooth cutting is clearly indicated by the condition of the machined surface and the chips removed. The cutters are ground on the face of the teeth so that the resistance to the curling of the chip is reduced to the minimum. The cutters are constructed with exceptionally strong teeth so that they will stand up to the work under the heavy cuts. The rail-holding fixture is designed to accommodate two sections of rail and placed far enough apart to permit of locating the auxiliary steady bearing between the two cutters, thus making for

Illustrations and information supplied through the courtesy of the Cincinnati Milling Machine Co., Cincinnati, Ohio.

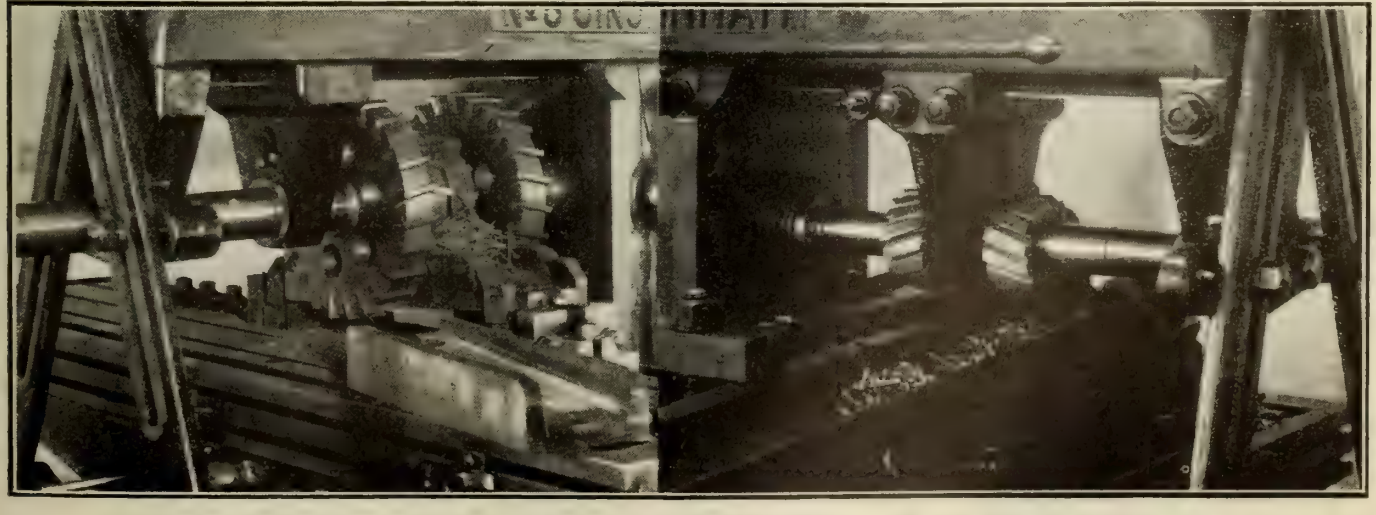

Fig. 1—Left: heavy milling work on driving box wedges. Fig. 2—Right: tapering steel rails for frogs and switches.

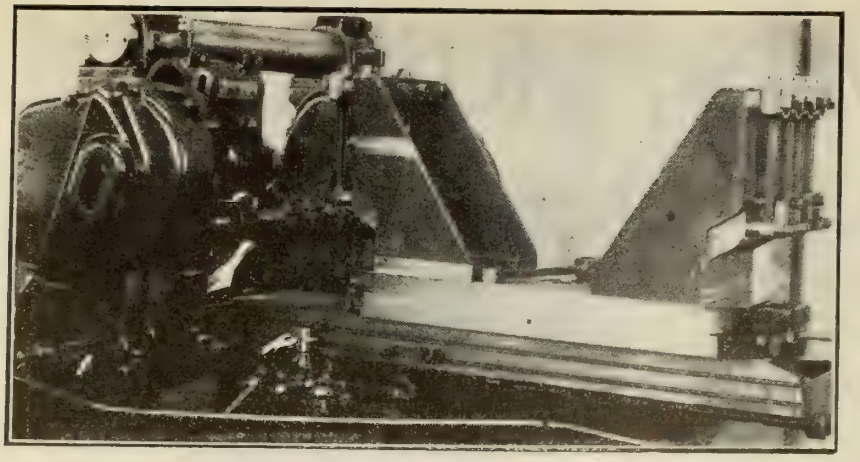

Fig. 4—Duplex milling machine at work on connecting rods.

extreme rigidity under exceptionally heavy cutting.

Fig. 3 shows a very interesting gang of cutters performing a rather difficult operation on a comparatively small milling machine. The cut is clearly indicated by the sample, and you will note that it consists of a deep slot and the milling of a boss. The cutters themselves are mounted in rather unusual fashion, the mounting being designed to reduce the necessary cutter diameter to a minimum. The slotting cutter is at best a very delicate and expensive tool, and one which because of its diameter and weak section does not act ideally.

It will be seen that the teeth of the side mill have both face and peripheral rake, also that they are all of one hand. The mill itself is bolted directly to the face of the spindle by four screws in much the same way as the face mill, and it drives from the two slots which mesh with the driving keys on the spindle. Through the spindle is fitted a special stub arbor which is held back by the draw-in bolt in the usual way. This stub arbor drives from the other pair of slots in the side milling cutter. On the arbor is mounted the special slotting cutter, the drive for which is obtained from a keyway cut across the face of the hub. The mill itself is held on the arbor by a special washer and hollow set screw combination. Note the long hub on the slotting cutter to give it stability and driving strength. Also note the shape of the teeth of the cutter staggered alternately right and left with ample side clearance. The total width of the teeth is considerably less than the width of the slot, so that the chip produced by each tooth will be less in width than the slot, insuring that the chips will not pack up in the slot, but will come out freely.

Another interesting thing about the gang is that the keyways are arranged so that the teeth in the side mill and in the slotting cutter are staggered. This gang of cutters is able to take the following cut on the No. 1 universal: Slot 2¼ inch deep by 9/16 inch wide, plus 3/16 inch removed from the boss, at a feed of 3⅞ inch per minute.

Fig. 4 shows a 48 inch duplex machine being used as a plain miller for performing the operation of milling the rounding on the wrist pin end of large truck connecting rods. There are four interlocking form mills used, 7 inch in diameter. They are relieved in such a way that ten degrees front rake is secured. Each cutter is made in two parts, interlocked first for maintaining size, and second, for improving the cutting action. Note that the teeth of all the cutters when in position on the arbor lie in approximately a spiral around the arbor. This arrangement has a tendency to break up the cut, and eliminate the heavy pounding so noticeable on many large form cutter gangs. Each individual cutter, of which there are four, is made in two parts, and each part has two keyways. One of the keyways in each half is located so that the front faces coincide. The other keyways do not coincide. The first keyway is used for grinding, and the second for driving on the arbor. This particular operation is going through smoothly, and the time per piece is about one-third of a minute. The duplex fixture provides for continuous operations as one end may be loaded with work while cutting is proceeding on the other.

POTS FOR HEAT TREATING

Special alloy heat-resisting pots are by far the best investment when compared to cast iron, malleable iron and cast steel. The round pot will be found to give a greater life than the square pot, due to the equalization of expansion and contraction stresses. The cored or chimney pot is only efficient, considering its added cost, where the chimney is 5 in. in diameter or over. Too large pots should be avoided for small work. The round pot will be found most satisfactory for pinion and ring gear work. It offers the advantage of even heating, and prevents the tendency to overcrowd the furnace hearth space.

Square or rectangular pots are best for splined shafts, but the work must be packed with due regard to the transference of heat. The size of the pot should not be greater than the work demands. This is imperative from the standpoint of handling, slowness of heating and the subsequent unevenness of carbon penetration from centre of pot to outside. It is also imperative that the pot should not be greater than is required by the work on account of the slowness of cooling where work is pot-cooled, with the subsequent separation of the carbon zones.

The best dimensions of the pot depend largely on the furnace. Too high pots are as bad as those too large in diameter. The average furnace varies greatly in temperature from top to bottom, and this variation increases with the arch height. A well-proportioned pot never exceeds in height the greatest width or the diameter. The height is best made between five-eighths and seven-eighths of the greatest width or diameter. All pots should be cast with legs to allow circulation of heating gases. For this same reason the floor of the furnace should be scraped clean after each heat. Great care should be used in sealing of the pots. The tighter the seal the more uniform the results.

Suggested Standardization of Machine Tools

Benefits and Cost Compared—Work-holding and Tool-holding Fixtures—Uniformity in Interchangeable Parts—Research Will Aid the Movement—Considering Elementary Details First

By FRED H. COLVIN and K. H. CONDIT

THERE are two outstanding phases of the problem of standardization of machine tools, one as it affects the builder and the other its effect on the user of the machines. The former can be left to the builders themselves, as it affects the cost of manufacture and the amount of capital invested. The latter, the effect of standardization on the user, is of direct interest to all.

One of the first considerations in making or advocating any change from existing practice is whether the benefits to be derived are worth the cost. This holds good with the proposals for standardization of machine tools, and this question of cost very frequently makes what we are pleased to call standardization really a matter of elimination. We usually eliminate unnecessary sizes and make those which we retain the standard, rather than adopt an entirely new standard which is the result of careful investigation, calculation, and experiment. And while this may not be the ideal procedure, it is the practical solution in most cases. Devising a new standard too often means simply adding another variety rather than eliminating many which are now in use.

Advantage of Uniformity

Those who deprecate this unscientific method of standardization should remember that one of the greatest advantages of standardization, perhaps the greatest, lies in uniformity rather than in perfection as to the standard adopted. Taking the gear shift of an automobile as an example, the question of superiority in any particular shift sinks into insignificance in comparison with the advantages of having any one of the gear shifts adopted as standard on all cars. The typewriter keyboard is another excellent example of this.

Standardization of machine tools from the standpoint of the user can be confined to two specific points, work-holding and tool-holding devices. The former affect principally the spindle noses of lathes and the T-slots of planers, milling machines, boring machines, driling machines, and the like. Tool-holding devices affect the spindle noses of milling machines and drilling machines, turret holes, tool posts, grinding-wheel spindles, etc. And while these look innocent enough on the surface, it does not take long to find that it involves the old controversy as to tapers, which is enough to start a heated argument in any shop.

Interchangeability and Accuracy

Every mechanic who has handled precision work knows that it is not practicable to interchange lathe chucks on very accurate work with the idea that the chuck will run dead true on more than one machine. On the great majority of work, however, the ability to change chucks from one lathe to another, without the bother of making adapters (which usually add considerably to the overhang) would be of great service in many shops. In the same way fixtures should be interchangeable from one machine to another by the use of standard T-slots in the tables and probably a standard distance of the first slot from the edge of the table.

The inability to use given turret tools in more than one machine imposes an unnecessary expense on the shop overhead and also directly affects future sales of the machines in question. The builder whose machine has odd sizes of turret holes, for example, will have a hard time securing an order from a shop equipped with machines having a different size, even though one be as logical as the other. And while an order once secured might tend to force a continued use of this machine, it is apt to prevent an order at least as often as to secure one.

T-Slots

The standardization of T-slots is probably the easiest place to make a beginning, and here again it will undoubtedly result in the elimination of perhaps half the sizes, retaining only those which are necessary. A canvass of the total number of each size of T-slot cutters sold should make it easy to select the sizes most in use.

But even T-slots have several points to be considered: the width of slot opening, the width and depth of the T for the bolt head, and the depth of metal over the slot to resist pulling out a piece of the table. Uniformity as to this latter feature is, however, less important than the width, as that is what affects the use of tongs for locating milling fixtures and the like. The distance of the outside T-slots from the edge of table is also important.

It may be well to emphasize right here that no matter what is being standardized, it must be remembered that tolerance must be given in each case. And in considering tolerances, let us bear in mind that the modern tendency is toward an unilateral tolerance—a plus tolerance on the slot or hole and a minus tolerance on the part which fits it. Let us get away from the "plus or minus" tolerance on the same piece. Standardizing T-slots also involves the standardizing of the T-bolts which are to be used in them. Carl Barth has given this careful attention and his recommendations have been taken up by H. Cadwallader, Jr., of Philadelphia, who now manufactures T-bolts to the Barth standards.

Another point to be considered in standardizing work and tool-holding devices is to have the same size on as many machines as may be practicable. It may often be convenient to use the same chuck on a 14-in. and a 24-in. lathe. This is probably too big a range to be adequately covered by the same spindle nose, but it is quite possible that the same size of nose might be used on two or three sizes of machines. Some builders already use the same feed box on different sizes of machines, which is a very sane and sensible practice.

There is considerable talk of standardizing machine capacities, such as the swing of a lathe. But while it would be more convenient all around to know just what was meant by a 14-in. lathe, this is really a problem of the salesman and the buyer. If the seller prefers to cut prices by selling a 17-in. lathe under the name of a 14-in. lathe, it hardly affects the user so long as the work-holding or tool-holding devices on the lathe are standardized.

The milling-machine builders have perhaps done more in this line than builders of any other machine tools. A No. 1 machine now has approximately the same capacity in nearly all makes. The use of numbers, however, has little to commend it, whether it be milling machines or wire gages, and it is believed that main dimensions as to capacity would be more satisfactory to users.

Standardization Does Not Hamper Progress

One of the stock objections to standardization is that it prevents progress and the development of new ideas and designs. If, however, we consider that the Society of Automotive Engineers has done more in the way of standardization than any one else and then note the development in the automobile industry, this objection is easily answered. Is it likely that automobiles or other machinery would be more highly developed if each building used a special-sized nut with a special thread?

Material prepared by the authors and presented at a recent meeting of the American Society of Mechanical Engineers.

Standardization of such parts as nuts, piston pins, and other parts simply means that the designer calculates his requirements, such as to the kind of loads and stresses, and selects the standard part which meets his needs instead of designing an entirely new nut or pin of a slightly different size. It must also be remembered that standards are not as fixed as the pyramids, but can be changed whenever occasion really demands.

While all our efforts at standardization at this time should be devoted to such details of machine tools as affect the user, such as work- and tool-holding devices as have been pointed out, it is quite probable that the machine-tool builders themselves may find further standardization desirable. Research may show that bearings of certain dimensions are best for given spindle loads and speeds. Designers would then determine the load to which the spindle of a new machine would be subjected, and after considering all the conditions, would select the proper bearing from a list of standards. This would simplify manufacture and greatly reduce the number of tools and gages to be carried in stock, as well as the stock of bearings themselves. This phase of the matter, however, does not concern the user of the machine, and he will do well to confine his efforts at securing standardization to such features as concern him directly.

Securing The Adoption of Standards

In addition to the engineering and economic aspects of machine-tool standardization, there is the adoption phase—for all practical purposes this is a selling problem. The best engineers of the United States, or of the world for that matter, may gather in solemn conference and decide that certain standards shall be established, but they have no power to do anything more. If the manufacturer concludes that his present practice is sufficiently satisfactory and is not convinced of the need for innovation, there is little that the standardizers can do.

Very often the problem is essentially a "selling" problem and one for which the average engineer is temperamentally unsuited. Diplomacy, tact, persuasiveness—the stock in trade of the salesman—are needed at this stage of the game. Even they would be futile if no means were at hand for gathering together the men who must make sacrifices if a standard is to be adopted, for lacking such means the task of reaching each man individually and reconciling his views with those of all the others, would be herculean.

The machinery for handling the engineering and industrial problems connected with this phase of standardization already exists in the American Engineering Standards Committee, and the rules of procedure of this committee are designed to bring about the early adoption of approved American standards. To this end all sectional committees are required to include in their personnel representatives of all organizations which are in any way interested in the manufacture or use of the standard under consideration. Since these organizations are officially represented on the committee which prepares the standard, it is obvious that the members of these organizations are committed to the adoption of the standard to the extent that any individual or firm is committed by the actions of an organization to which he or it belongs. Just how well this arrangement is going to work out when it comes to universal adoption of a standard it is too soon to say, but at least the plan shows promise.

It may be that the division of simplified practice of the U. S. Department of Commerce recently organized by Secretary Hoover will have a part to play in securing the general adoption of the standards for small tools and machine-tool elements which are to be developed by the sectional committee sponsored jointly by the National Machine Tool Builders' Association and the American Society of Mechanical Engineers. This, of course, will be determined as the work of the committee progresses.

So far the division has done its best work in fields of industry not closely connected with engineering. It is cooperating, however, to the fullest extent with the American Engineering Standards Committee in furthering the establishment and introduction of standards.

Standardization is a tremendous job and it may prove to be one beyond the capacity of any standards body yet organized.

BABBITTING A LOOSE PULLEY

When a pulley is to be babbitted on a shaft and in the position it is to occupy when finished, and the tight pulley is already in place and known to run true, the loose pulley may easily be located by means of the other. When using an arbor, first secure in a perfectly upright position, put a collar on it that will form a support for the lower face of the pulley hub. After the pulley is placed on, seal the joint with some suitable material as cardboard, felt or putty. Before placing the pulley on, it is well to cover the shaft with a layer of thin oiled paper, winding the same with heavy cord in a spiral form, the helix running toward the center of the hub in the direction in which the pulley is to run. The grooves left in the babbitt after pouring will serve as ample oil channels and will likewise tend to keep the lubricant in the bearing instead of throwing it out at the ends. Should it be advisable to locate the shaft in a vertical position, the alternative would be to level the shaft horizontally and using a plumb line across the sides of the pulley. By this method it is necessary to use a sealed collar on each end and it is also suggested to use a pouring hole in the hub instead of an oil hole, as the latter would afterwards require to be drilled out.

MACHINING PISTON RINGS

By John Magee

The majority of piston-ring manufacturers prefer to make rings with the finished surfaces ground to size. It is easier to hold accurate dimensions on a grinding machine than it is on a lathe. However, hard castings and hard spots in castings are machined without difficulty or detection by grinding. For this reason piston rings with a turned finish on the diameter dimension should be specified. Neither the scleroscope nor the Brinell hardness test will disclose hard spots in castings. A ground finish may cover up many hard spots or a hard scale. The production of a turned surface is a somewhat slower process for the manufacturer, but it guarantees a uniform soft wearing surface.

Flatness is very essential, since a serpentine condition will allow leakage around the back of the ring through the ring groove. If all of the internal stresses are not removed during the process of machining, the ring is apt to warp sidewise. Therefore width dimensions should be inspected with a light gage instead of with a micrometer. With the ring lying on a perfectly flat surface, a side warp will cause it to register oversize. With measurements at intervals the two points of the micrometer might indicate a parallel width on a ring considerably warped.

The most common defect in the manufacture of piston rings is the elliptical ring, generally termed "out-of-round;" tolerance may vary according to the amount that the ring is likely to be worn in on the block. At best it is desirable to keep the variation within very low limits, say, 0.00025in. to 0.00050in. If the tolerance is expressed in light-gage terms, it is much more simple for inspection, because the light gage is at present the most practical inspection device for locating out-of-round rings.

No accurate data are available for determining the poundage or wall pressure of piston rings to accomplish definite purposes. Actual experiments conducted at different times for different purposes seem to indicate that a poundage in excess of 4 lb. per sq. in. of bearing surface is needed to prevent collapse under pressure. Therefore a poundage of 5 lb. per sq. in. has commonly been specified for all purposes.

There seems to be a diversity of opinion as to the proper gas opening or expansion allowance. This is probably due to the difference in the estimated temperatures to which a piston ring is subjected. Using 0.0000056 per in. per deg. as the coefficient of expansion of cast iron, a minimum opening allowance for maximum expansion is obtained by multiplying this coefficient by the circumference of the ring.

Extract from Mechanical Engineer.

Operations and Tools Used in Making Gas Engines

Cross-head Tends to Equalize Wear on Cylinder and Piston—Economic Jig and Fixture Construction—Method of Locating Parts in the Jigs—Uniform Product Turned Out

By ROBT. MAWSON

THE marked difference in the design of these particular engines over the usual type is that they are made with a cross-head placed between the crankshaft and piston head, similar to a steam engine. In the usual construction of gas engines it is the practice to attach the connecting rod directly to a trunk piston, which is used as the cross-head. In this engine the wearing parts of the cross-head are placed where they are always cool and can be readily reached and adjusted. Further by removing from the piston head the angular thrust of the connecting rod the cause of extreme wear on the bottom and top of the cylinder more than the sides, and therefore out of round, is removed.

To the reader who has had experience with steam engines and the usual type of gas engines the argument here stated carries sufficient weight. The steam engine cylinder always tends to wear equally, the gas engine (trunk piston type) always wears the cylinder top and bottom, and the reason is the difference in attaching the crank and connecting rod to the piston.

When machining the various elements used in the building of these gas engines many interesting tools and methods are used and some of these will be shown and described in this article. Fig. 1 shows the jig used when drilling the bracket for the rocker arm. This casting has been milled on the sides of the two arms in a previous operation. The casting is then dropped into the jig with the clamp A swung out of the way. The two screws B are next tightened against the piece and these force the casting back to the two stop plates C, thus locating it in relation to the outside circular portion of the large diameter. The clamp A is now swung back, being held with the set screw D and the set screw E, which is past the center line of the large boss, therefore holding the element securely in the jig. Two ⅞ inch holes are then drilled in the piece through the guide bushings F and two holes for ½ inch standard tap are also drilled through the bushings G. The jig and casting is then reversed with the top surface resting on the machine table and a hole for ½ inch standard tap drilled in the boss H, the drill being also guided through a bushing in the wall of the jig.

Drilling Rocker Arm Bracket

Fig. 2 shows the jig used for drilling the rocker arm bracket. This casting has been machined on the face of the flange and also both ends of the long boss before coming to the drilling department. The piece is then placed into the jig and the screw A tightened against the inside face of the flange as shown, which forces it back against the machined surface. The screw bushing B is now screwed down, and as this is made with a cup surface it fits over the upper end of the long boss and forces the casting down, in a straight line, as the piece is held in contact with the wall of the jig by means of the screw A.

The advantage of this method of locating the casting is, that the hole machined in the large boss will be at the proper distance from the machined flange and also parallel to it, which is very important in this piece. The following holes are then machined; two 21/32 inch drilled through the bushings C and one ⅞ inch drilled and reamed through the long boss, the tools being guided through the screw bushing B.

The illustration Fig. 3 shows one of the larger jigs used at the plant, being the tool used when drilling the pump housing, the casting coming to this jig after the base A has been machined in a milling machine. The casting is then slid into the jig with the strap B swung back; the strap is placed in position as shown and the set screws C force the casting back against the locating stops.

The following holes are then drilled, fourteen to suit ½ inch standard tap, two ¼ inch, three 2¼ inch bore, three 1-1/16 inch bore and one hole drilled at the lower surface for ½ inch tap. It will be noticed that this tool has been made as light in construction as possible, holes being cored wherever possible so that it can be handled as conveniently as the size of the jig and casting will allow.

Drilling the Air Valve

In the Bessemer gas engine there is but one air and gas valve body. The valve is of the disc type and the valve action is vertical, so that gravity aids the springs in seating it. On the smaller sizes this valve is composed of only one disc, while the larger sizes have two discs. The advantage of the disc valve is its extreme lightness, less lift required on account of there being an opening on the inside of the disc as well as the outside. Less weight and less lift results in a much quicker acting valve, hence better efficiency.

Fig. 4 shows the jig used when drilling the air valve. The valve consists of the body proper, a cage and either one

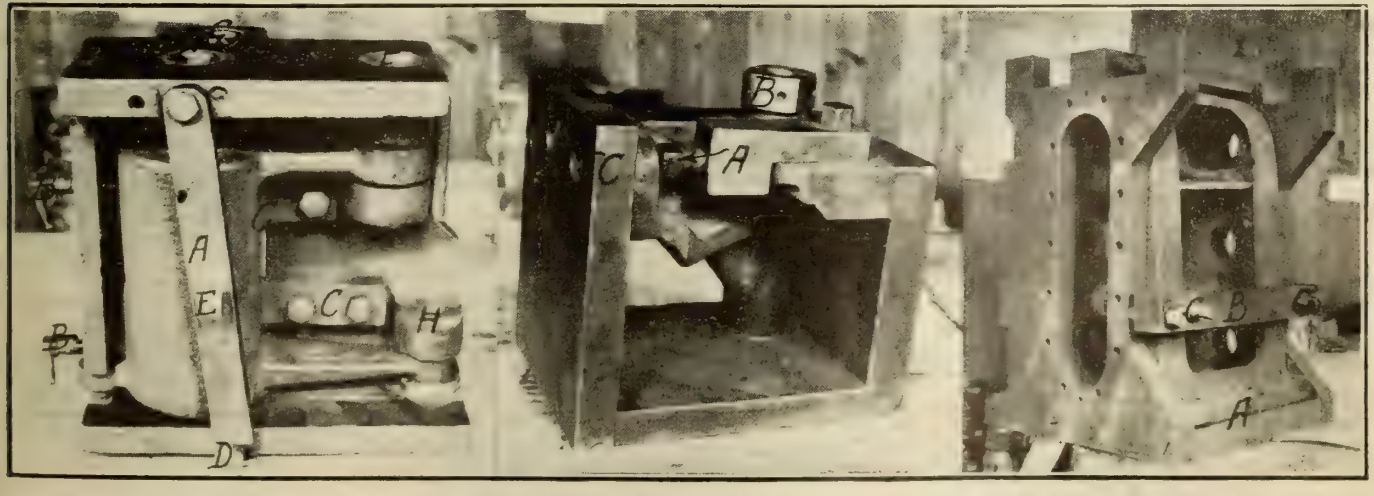

Fig. 1—Left: drilling bracket for rocker arm. Fig. 2—Centre: jig for drilling rocker arm bracket. Fig. 3—Right: jig for pump housing.

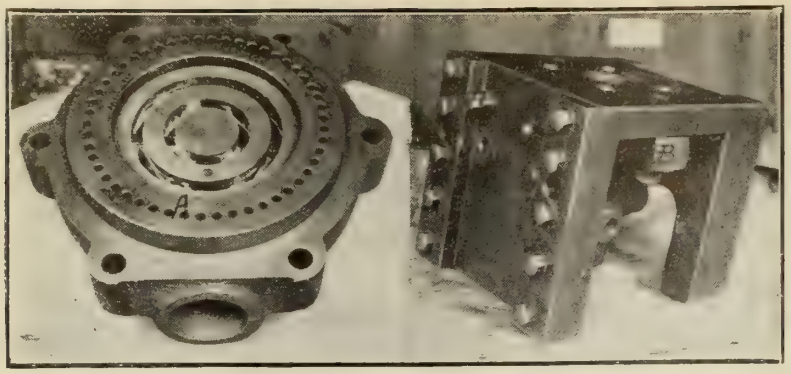

Fig. 4—Left: drilling the air valve. Fig. 5—Right: jig for air starter body.

or two flat steel discs, depending whether the valve is for a small or large engine. The body is first faced perfectly flat on the joint surface, and the bolt holes drilled, also the gas and air openings. The cage is also drilled to suit three springs which are used in the construction. The discs are ground on their faces and afterwards lapped in contact with the valve body until a perfect bearing is obtained.

The jig A is then placed onto the valve body, being located by means of a recess which fits over a machined register on the casting. Fifty ¼ inch holes are then drilled in the body, the drill being guided through the bushing holes shown in the jig. The holes drilled are used to admit the gas into the valve which comes in contact with the air in the mixing chamber to form the proper explosive mixture.

The jig shown in Fig. 5 is used when drilling the air starter body. This casting is first bored and a register turned and the face machined square with the bored hole. The piece is then placed into the jig being located with the turned register which fits into a recess in the face of the tool. The screws A are then tightened to bring the piece square in the jig and the clamps B hold it securely for the drilling operation. The following holes are then drilled four ⅞ inch and one ¾ inch through the upper wall and two ¼ inch through the left hand vertical wall of the jig, bushings being provided as shown to enable the parts to be produced of an interchangeable nature.

It will be seen that all the tools used at this plant are somewhat simple in their design and do not require an enormous outlay either in their design or manufacture, but it is only by the use of jigs and fixtures that accurate and interchangeable parts can be obtained. The advantage is two-fold, the first cost is much lower when making the new engines, and what is of equal if not more importance is the fact that repair parts can be supplied to any part of the world knowing that when these parts arrive they will be accurate and fit without the need of so much as a file being used.

Pattern Changes Save Money

By D. A. Hampson

A very slight change in pattern design will often make a great difference in the time taken to make the subsequent castings and in the quality of those castings. Sometimes, the nature of the change may take on a mere simplification of shape, it may mean the elimination of cores or the addition of a core to a solid piece, again the pattern or patterns may have been arranged for bench moulding and have been altered so as to go on a machine, or it may be that frail and uncertain wood patterns are replaced by metal ones.

In any case, the object aimed at is to get out smoother castings, castings that are lighter, and that require less metal to be removed on the machines in the shop. No matter whether half a dozen castings only are required or whether the job is a "manufacturing" proposition, it is always in order to scan the patterns for possible improvements. And the biggest single aid to the machine shop man is a frank talk with the foundry superintendent.

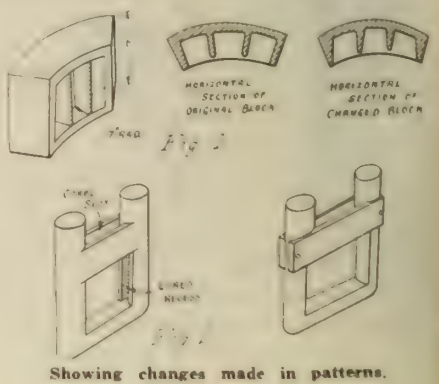
An engineering plant was buying 40 tons a year of a certain casting weighing 900 lbs. and paying 4½ cents a lb. for the iron. The foundryman suggested a certain change but it was of such a nature that an entirely new pattern would be required, and this at a cost of about $150. Finally the plant agreed to make the change, more to please the foundry people who really turned out superior work than with thought of actual gain. To their surprise they got those castings for 3½ cents a lb. from that time.

Fig. 1 shows a part that was made up in lots of one and two hundred. It is a packing block, or parallel, to be used on a hydraulic press. The interior is cored for lightness. One can see at a glance that the core is simple but yet it took time to make each one and time to set it in the mould. A change in shop executives took place and this job came under the scrutinizing eye of the new man. He had a new pattern made in which the ribs were parallel instead of radial as in the original. With the radial ribs, a core was necessary—with parallel ribs, the pattern made its own core; thus, the moulder's time was saved and there was no core work at all. There was a little more iron in the casting—about 4 cubic inches — where the ribs were given draft and the filling in required at the outsides but the cost of this was offset several times by the savings effected.

A smaller flask could be used, the moulder had an easier pattern to handle, there was no knocking out of cores afterwards, and there were no delays due to cores being behind time. This is a fine example of a very simple piece, yet one on which able men fail to see the shortest way. Just because a relatively small number were required at a time, the thing was not given intensive thought.

An example will be given of a saving on a manufacturing job. Fig. 2 shows an iron specialty used in the clothing field. It has a core 3/8 inches x 1-3/4 inches through one end, thus leaving 1/8 inch bridges joining the two posts. Jaws were fitted in this cored slot and as a consequence it had to be filed out smooth. Literally, hundreds of castings were broken in the work of cleaning the slots in the shop. And an equal number were returned because inspection showed that the casting could not be cleaned or saved. Several good foundries were given trials on this work, extending over a reasonable period, but the result was always the same. The fins and little chilled lumps that stuck to the bridges had to be ground, chipped, or filed according to their location and interior core imperfections had to be laboriously filed down. Because of the large number of rejections, the foundries charged an average of 12 cents a lb. for the castings, which was not unreasonable for cored work at that time. When the cost of breakages and of labor on good castings was added to the foundry charge, it was discovered that the castings ready for shop processes cost about 22 cents a pound.

Some study in the planning department resulted in the changed design shown. Steel plates were used for the bridges, riveted to the prongs of the castings. By this change, the castings were made without cores. There was so little time spent in snagging that it was negligible. Rejections and breakages did not run over 1 per cent total.



Showing changes made in patterns.

Various Methods of Fastening and Driving Gears

Accuracy in Concentricity is Essential Factor—Reaming and Grinding the Bores—Broaching Revived the Square Shaft Drive —Transmission of Power—Service of Different Gears

By CHESTER B. HAMILTON, JR., B.A.Sc., M.E.

THE great majority of gears have plain cylindrical bores and drive or are driven by a key. Gears which are pressed or shrunk on the shaft drive through the fit, which may be considered an exaggerated case of friction drive, the minute irregularities of surface being forced to interlock. When a key is provided in such cases it is as a precautionary measure or to ensure alignment in assembling, as in some styles of pair-geared crank presses. The cylindrical bore must be, within close limits, truly cylindrical and of accurate diameter if the gear is to give a satisfactory performance in service. Tightening up with the key is bad practice anywhere, but is intolerable with gears. The actual limits required depends on the class of work and its size. The standard subdivisions and limits are set forth in a later section.

Use of Set Screws

Set screws are frequently used as a means for fastening gears. While these are satisfactory for pulleys, levers, etc., they are an indifferent fastening for gears where they have to take the driving torque, except in quite small work, or cases of light duty. The use of set screws to prevent gears shifting along a shaft is however, quite another matter, and is good practice. This often occurs where the gear has to be slipped over a sunk key in the shaft. Such a key is very difficult to fit, and is often made quite slack.

The holes in high grade gears are always reamed if the gear is not to be heat treated, but hardened gears are ground in the bore after hardening. For this operation the gear is chucked by the teeth, using rollers in the chuck jaws which bear at the pitch line at three points only. Thus the bore is ground concentric with the pitch circle to very close limits. If the end face of hub is required to bear against any other part as it revolves, it is usual in good work to grind it also true to the pitch circle, and generally at the same setting as the bore.

Taper Bore Drive

A taper bore is often used in gears that are mounted on the overhanging end of the shaft, so that a retaining nut can be used. This is more common with pinions than gears, as it is not good practice to overhang a gear if it can be avoided. The commonest examples of taper bored pinions are the driving pinions of most automobiles, which mesh with the crown or ring gear in the rear axle, and the street railway motor pinions. It is almost universal practice to use a parallel key, or a Woodruff key, with a taper bore. Set screws and taper keys are bad, as they apply a side pressure which directly tends to loosen the pinion. If the taper of the bore is slight, such a pinion can drive by shrinking almost as well as with a cylindrical shrink fit. Street railway pinions have a taper of 1¼ inches per foot and standard practice requires them to be shrunk on from a temperature of only 212 degrees Fahrenheit after being driven home on their conical seat with a sledge. Even at this low temperature difference the shrink pressure is sufficient to drive for all operating conditions. The key is only provided in case the retaining nut should work loose and permit the pinion to shift down the taper and free itself. Taper bores must be accurate to taper as well as the other dimensions, and within quite close limits, otherwise the extra expense of making in this form is wasted.

Driving With Square Shaft

The square shaft drive is a very old form and was much favored in the old days of hand-made machinery. It fell into disuse, until it was revived by the development of the modern broaching machine. The pull broaching process opened up many new avenues of machine construction, and the use of specially shaped holes in gears was one of them. For most automotive and similar class of work the square has now been superseded by multiple spline shafts, but for a long time it held a leading place on account of the simpler shaft and the lack of means at that time for accurately and cheaply furnishing the splined shaft. Standard sizes and standard limits have been adopted by the Society of Automotive Engineers for the square holes and square shafts for both fixed and sliding fits.

Multiple Splined Shafts

Multiple splined shafts and broached holes have also been standardized by the Society of Automotive Engineers in the four, six and ten spline forms. The six and ten spline forms are specified with three different depths of spline, for permanent fit, to slide when not under load, and to slide when under load. The pressure per unit of bearing area on the sides of the splines is of course the governing factor, the greater depth of spline being required in the last mentioned case. The four spline form is designed for only the first and second cases, and not to slide under load, as with only four splines to carry the load, the depth required to provide the needed bearing area would give a badly proportioned cross section of shaft.

Suitable limits specified in each case for the diameter of shaft body and diameter over the splines. All allowances for fit are made on the shaft. The standard dimensions are for the soft broached hole before hardening. Such gears are practically always hardened. They are usually also ground in the bore, and therefore the fit is on the smaller diameter of the shaft, and the height of the splines on the shaft is reduced for clearance. No other way would be right on the four spline form, but on the multi-spline forms the widths of the land and of the grooves are nearly equal, and if the grooves in the gear come from hardening clean and smooth enough, and if the shrinkage is uniform enough, it is quite possible to take the fit on the bottom of the broached grooves in the gear and the top of the spline on the shaft. In this case accuracy of fit would be obtained by grinding the outside diameter of the shaft on a cylindrical grinder. In other case, where the bore of the gear is ground, a particularly close fit or smoothness of sliding can be obtained by also grinding the small diameter of the shaft with a concave face wheel with its axis at right angles to the axle of the work.

Forming the Splines

If a form wheel is used of profile to agree with sides of the splines as well as the bottom of the groove, a close limit can be maintained on the width of spline. This is important, for slackness at this point is a very bad feature in a gear and conduces not only to noise therein, but a hammer blow under fluctuating speeds and loads is transmitted to the remainder of the mechanism which is very destructive. The form of face of the grinding wheel, while complicated, is not as difficult to maintain as might be thought. Three diamonds are mounted in separate holders combined into one dressing fixture. Two of them slide in inclined guides to dress the bevelled flanks of the wheel face, and the centre diamond swings about a pivot to dress the radius in the middle of the face. All three are separately adjustable to positions dictated by the inspection of the product.

As to transmission of power, the duty required of gears may be classified under four heads according to the severity of the service. First, they may be required to transmit motion only, with negligible force, and velocity not a factor in the design. Such gear applications are found in clocks, meters, indicators and some indexing devices. Sometimes in fine work the correctness of the tooth form to give uniform angular velocity at all phases of the tooth action is important. In such cases the generated involute is the natural choice. These gears are fine pitch and small.

Load at Low Velocity

The second class of gear applications covers cases where they are required to transmit load at negligible velocity. These are mostly heavy, coarse, slow moving jobs or hand power applications, and include hand power winches and hoists, some indexing mechanisms where the gears must do the holding between motions as well as the moving, and the final pair of gears in a great many trains of gears, where the object is to apply slow motion, as in traversing a gantry or opening a swing bridge. These gears are coarse pitch, of substantial design and common workmanship, sometimes not even with cut teeth, but only rough moulded.

High Speed Drive

The third kind of application calls for gears that can transmit load with velocity, and includes the general run of gear work, and the great majority of cases. Unless otherwise specified gears are designed for this class of service. The ordinary factor of safety provided for overload also taking care of incidental minor shocks. On account of the velocity, the tooth form and workmanship are important factors, of which greater account must be taken as the velocity increases. The style of gear is also a factor, as helical or double helical gears can be run at very much higher speeds than straight toothed gears.

Providing for Shock

Of the fourth class, are those applications where power must be transmitted, not only with velocity a factor, but also with provisions for shocks. This is the most difficult case for which gears have to be designed, as frequently the shock may be much more important than the continuous load that it accompanies. Typical illustrations are found in rolling mill work, in punch press gears, ship steering gears, rock crushers, clashing change gears in automobile transmissions, etc. In this class of work the material is of paramount importance, toughness being an essential quality. Steel, often high grade alloy steel, or special bronzes are required. First class workmanship and correct tooth form are important for the shocks, and throbbing due to bad meshing and defective tooth action should not be added to the peaks of the applied load. The form of the gear is also important. Pinions of small number of teeth are bad, because of poor tooth action, and also the weakness inherent in a pinion due to narrowness across the roots of the teeth. Double helical gears are at a premium on account of the smoothness and continuity of tooth action. Where small numbers of teeth are necessary, the double helical pinion of wide face, cut solid on the shaft will often save an otherwise impossible situation.

PIG IRON OUTPUT SHOWS AN INCREASE

Pig iron production in Canada during October showed an increase of 11,194 tons or 47.7% over the record for September, and amounted to 36,888 tons as compared with 24,974 tons in the previous month, according to a report issued by the Dominion Bureau of Statistics. The increased tonnage was almost wholly basic pig iron manufactured for use by the firms reporting. The production of this grade increased from 16,976 tons in September to 28,922 tons in October or 70.4%.

Although the October production showed an encouraging increase and was the greatest since March of this year when an output of 41,733 tons was reached, it was still below the monthly average for 1921.

During the ten months ending October, the average monthly production of pig iron was 31,287 tons this year as compared with a monthly average of 50,673 tons in the same period last year. The cumulative output was, correspondingly, 312,877 tons in the past ten months as against 506,730 tons in the first ten months of 1921.

The number of active furnaces at the end of October was unchanged at four, viz: one at Sault Ste. Marie, one at Hamilton and two at Sydney.

The production of ferro-alloys remained practically the same as in September at 1,823 tons comprised wholly of ferro-silicon of 15 to 80% grades. Of this amount 68.6% was of 15% ferro-silicon.

Steel Ingots and Castings

The output of steel ingots and castings in Canada during October amounted to 52,735 gross tons, an increase of 47.3% over the September production of 35,787 tons. Basic open hearth ingots produced for further use by the firms reporting, amounted to 50,851 tons in October as compared with 33,815 tons in September, an increase of 50.4%. The average monthly output of basic open-hearth ingots during 1921 was 53,489 tons and for the first ten months of the current year averaged 37,052 tons. The month of October therefore showed a decrease of 4.9% from the average production for 1921 and an increase of 37.2% over the average for the first ten months of this year.

Basic open-hearth castings made during the month amounted to 974 tons, an increase of 137 tons or 15.2% over the preceding month, and most of the production was made for sale.

The output of Bessemer castings declined slightly from 180 tons in September to 125 tons in October, a decrease of 30.6%. Electric castings also fell off 10.6%, the actual production being 831 tons in September and 743 tons in October.

The cumulative production of ingots and castings for the ten months of the current year amounted to 387,570 tons as compared with 549,792 for the same period of last year, a decrease of 29.5%.

The average monthly production for 1922 is 31,000 long tons of pig iron and 39,000 long tons of steel, the lowest in five years.

Textile Machinery Marvels:—At a recent textile machinery exhibition in Great Britain an original type of machine caused a great deal of interest. This machine is known as a cotton "opener" and its function is to release the cotton fibres. It consists of a slowly revolving perforated horizontal cage, in the lower part of which is a rapidly revolving mechanism of great ingenuity. A series of stampings of special form are whirled round in such a way that they subject this cotton to a series of light and very rapid taps. The fibre thus released is blown away by a strong current of air, and the result is that all the fibre is obtained without the least damage. Another interesting machine at this Exhibition was for the purpose of humidifying or imparting to the atmosphere of the factory the exact degree of dampness required to give the best results in cotton spinning. In this apparatus a very fine jet of water is met by a jet of compressed air which expands with such force that it vapourises the water with extraordinary fineness. The molecules or drops of water are in fact so minute that they are absorbed into the atmosphere without condensing or leaving any dampness on objects in the factory.

Giant Machine Tool:—The enormous range of the modern machine tool may be realised by comparing the tiny electric drill, with which the dentist tortures us for our own good, and a huge machine such as that recently constructed by a British firm for surfacing and boring the casing of steam turbines. This machine weighs about one hundred tons and is probably the largest of its kind yet built. It is capable of boring out large casings and of surfacing them without the casing being removed. It is driven by a thirty horse power motor, with an auxiliary motor for shifting the tool. All the latest improvements are embodied in this giant machine, which carries out every variety of operation with the greatest accuracy and at maximum speed.

Analysis Versus Brands in Buying Tool Steel

Present Methods of Purchasing Steel Based on Better Knowledge of Analysis and Requirements—Hardening Performed on an Intelligent Basis and Guess Work Eliminated

By K. A. JUTHE

FOR YEARS the purchasing departments of large industrial concerns have been working under a severe handicap when requisitions for a particular brand of tool steel have been sent in, and endless discussions have taken place. The results of catering to the individual have been most unsatisfactory from an economic standpoint, readily ascertained from the periodic inventories taken. Very often every tool steel manufactured has been represented, causing a lot of unnecessary work in the stock room and accounting department, and representing doubtful value as to investment.

Almost every worth-while purchasing agent is to-day essentially a purchasing engineer and naturally is interested in the why's and wherefore's of requisitions.

Earlier Conditions

A good many years ago only a few tool steel manufacturers were represented in this country. The use of tool steel was confined to the straight carbon variety, all manufactured under most identical conditions, and this was ordered by the buyer for the purpose for which it was required and no one was interested or cared about carbon content. Hardening and working directions were supplied by the seller. Industrial concerns adopted one brand or another, based largely on local conditions or because the salesman was a likeable chap, but most likely somebody's grandfather had used it. There was no need of selling arguments, prices were established, metallurgy was almost an unknown quantity, and efficiency experts had not put in their appearance.

The writer was for many years a tool steel salesman and the reason given by many users for sticking to a particular brand of tool steel would make very interesting reading. We have an instance on record where a foreman of a fairly good-sized plant yearly sent to England for several hogsheads of water to quench tool steel made from an English brand, having found that he could not get satisfactory results from tools quenched in water procured in this country. There is no doubt but that in times past, when the toolmaker not only made tools but also personally did the hardening and tempering, the familiarity with a certain brand inspired confidence, and if a cracked tool was the result the steel was never blamed.

As time passed more efficient methods of specializing have been adopted, and it is now necessary to furnish the hardening department with full data as to the analysis of steel—at least as far as the deciding elements are concerned—so that the hardening can be performed on an intelligent basis and guess-work eliminated. It is, of course, quite true that buying steel or anything else on a purely price basis is a short-sighted method, and it is quite possible to make poor steel on an analysis specification. Instead of using the term "analysis," which is a more or less misleading term as far as tool steel is concerned, the term "specifications" should be the basis of purchase.

The war changed a great many methods of manufacture and developed the science of metallurgy to a high degree. The manufacture of tool steel is no longer a mystery, and, as no manufacturer has been able to monopolize brains, the competition on acceptable specifications will be fully as keen as when tool steel is sold as "brands."

Groups of Tool Steel

Tool steel is headed under three groups: high speed, alloy and carbon. The elements on which each group is based have been thoroughly classified. Each element has its own particular function, and tests running over years have been made to ascertain the different percentages of each element to accomplish sought-for-results; in fact, it is not due to the steel mills that the thousand-and-one different brands are on the market, but very largely due to calls for steel on a particular analysis specified by some metallurgist for test purposes. If the results of such tests were satisfactory the mill would immediately tag it and advertise the wonderful new brand it placed on the market.

When tool is ordered by the "brand" the purchasing agent is specifying a certain analysis. The difference is, however, that he is also specifying the particular manufacturer of this brand, thereby cutting out competition. The government decided some years ago to analyze the different brands of steel that gave satisfactory results, and now purchases by analysis, also specifying "to be made by either the crucible or electric process" and giving Brinnell hardness desired.

A great many of the large users of tool steel have also adopted the specification method, which invites competition and makes it possible for the purchasing agent to choose several sources of supply, take advantage of better delivery, and possibly save something on freights. The mere fact that a mill has been manufacturing steel for one hundred or more years, and that all the experience gained in this time is solely for the customers' benefit, is of doubtful value. A firm's reputation for honesty and good service as an asset of the very best kind should be recognized, but the statement that a certain brand has been made for a number of years is not conclusive proof that the same analysis cannot be made equally as well in some other mill.

Similarity of Brands

The facts are that the same analysis of every "brand" is manufactured by the different mills by either the crucible or electric process. The stages of manufacture throughout the different operations are very much the same, and no mill can afford the least carelessness in the inspection of its out-put while in process. Competition is too keen, and there is not the least danger of any inferior material being delivered if purchased on "specification" instead of "brand."

It is not the sense of this article to recommend the purchase of tool steel by either one of the two methods, but simply to state from a metallurgical and engineering standpoint that the purchaser is a freer agent when buying steel on an approved "specification" and can no doubt save a great deal of time, particularly on deliveries, when having more than one source of supply.

If only small quantities of tool steel in any one or all of the different groups are used, there is not any decided advantage in analysis specifications, but where the quantity is large, the different steels which have given the best results should be analyzed and specifications should state, "to be manufactured by either crucible or electric process," the limits as to size of rolling, free from all defects, limits of the different elements, Brinnell hardness, annealed or unannealed, acceptance subject to certain predetermined shop tests and delivery.

It will be impossible under such specifications not to cover an analysis not bearing a "brand" name from at least 90 per cent. of tool steel manufacturers and this, therefore, eliminates the possibility of slighting the established reputation gained by the manufacturer of the particular analysis specified.

Safe Practices in Acetylene and Oxygen Welding

Accidents Relatively Small Compared to Volume of Business—Danger When Acetylene is Generated in the Open From Calcium Carbide—Care Must be Exercised in Lighting Storage Rooms

THE RECORD of the oxy-acetylene industry is a wonderfully good one, and the number of accidents that occur are really infinitesimal when one takes time to consider the exceedingly rapid growth of the process and the enormous extent to which it is now employed. I do not think it is possible to-day to cite a single industry in some of the ramifications of which oxy-acetylene welding is not employed.

There have been some serious accidents in which oxy-acetylene has been involved, but practically in every case, such accidents would have been avoided if common sense had been used and if the recommendations made by the National Safety Council had been followed.

One of the troubles the oxy-acetylene industry has had to contend with in the past has been that the heads of the establishments have not appreciated the importance of their welding work; consequently they have not personally, taken the trouble to learn much about it, and have left matters relating to it entirely in the hands of subordinates, without first assuring themselves that the subordinates delegated to look after the work knew sufficient about it, and without making sure that the right sort of equipment was being employed, properly installed, and safely operated.

Calcium Carbide itself does not constitute a fire hazard, but when brought in contact with water, acetylene is generated, and acetylene is an inflammable gas. Therefore Calcium Carbide should be stored only in dry and well ventilated places. Many users store their Calcium Carbide in the same building or compartment in which their acetylene generator is housed. When the Calcium Carbide is stored in the same compartment with the acetylene generator, the Carbide should be placed on a platform at least 6 inches higher than the main floor level, so as to keep the drums clear of any water that might get on the floor when the generator is being flushed or when the floor is being washed. It is always essential to see that drums, the contents of which have been partly used, have their screw cover put back after a part of the carbide has been removed from the drums. Otherwise moist air will attack the carbide in the open drum and generate acetylene gas, which might accumulate in the premises.

It should be appreciated that no matter whether Calcium Carbide is stored in a separate building or in an acetylene generator house, the location should only be illuminated with incandescent electric lights, which should be properly guarded so as to prevent the globes from being broken by accident; and all switches should be outside the building as should other spark emitting devices, including the telephone. In cases where Calcium Carbide is stored in large quantities, and a separate building or compartment is used for this purpose only, it is desirable, where feasible, to have the floor of the building level with the floors of railway cars and trucks. This will facilitate unloading and prevent a certain amount of damage being done to the drums, which frequently occurs through rough handling when the drums have to be lowered to the ground from a car or truck. When unloading Calcium Carbide received from the shipper, any drum that has been damaged in transit to the extent that a hole has been made in it, should be set to one side for immediate use, or the contents should be transferred to another package. This would show that it is desirable to keep on hand a few empty packages for such emergency use.

In the matter of storage of cylinders of compressed oxygen and compressed acetylene, it is bad practice to have these stored and located indiscriminately all around your premises. Where compressed gases are used, you will naturally have to have a cylinder of oxygen and a cylinder of acetylene at each point where the welding work is being carried on, but cylinders on hand in excess of those in actual use should be properly and methodically stored.

With regard to the acetylene cylinders, it is considered good practice to store these in the room or building employed also for the storage of calcium carbide, but the storage space should be used for no other purpose except the storing of Calcium Carbide and cylinders of Compressed Acetylene. If the room or location in which the acetylene cylinders are stored is artificially heated, the cylinders should not be located close to the regulators. It will be noted that there is no need whatever to heat the locations in which Calcium Carbide or Compressed Acetylene are stored.

Acetylene cylinders, when being unloaded for storage, should be handled carefully. As in the case of Carbide, it is desirable where possible, to have the warehouse in which the acetylene is to be stored, to have a floor level with car and truck floors, but naturally this is only possible in establishments having their own car sidings.

Always insist that workmen employed in unloading cylinders of acetylene for storage, exercise care in lowering the cylinders from the truck or car to the ground. Workmen get careless on this job, and it frequently occurs that cylinders are dropped from truck or car floors to the ground, sometimes on to concrete. The cylinders are very strong and will stand an enormous amount of abuse, but is should be appreciated that they have pressure in them and that there are of necessity safety fittings which project from the surfaces of the cylinders. Many acetylene cylinders have fuse plugs located in their bottoms. These plugs are protected by a band which prevents their striking or coming in contact with the floor when the cylinder is properly and sanely handled; but nevertheless they can be damaged if the cylinder is dropped from a height, so as to cause the protecting band to be driven off the shell, or if it is dropped on to a rough surface. If one of the fuse plugs is broken off or loosened, gas will escape from the cylinders and may be ignited.

Oxygen cylinders can be safely and properly stored in your regular plant stock or supply rooms. However, they should not be stored close to radiators or adjacent to combustible materials. Above all things, be sure that they are not stored adjacent to oil or grease. If a warehouse is provided for the storage of oxygen, compressed acetylene and Calcium Carbide, the Calcium Carbide and Acetylene may be properly stored in the same compartment, but Oxygen should never be stored in the same compartment that Acetylene is stored in. The reason for making this recommendation is as follows:

Suppose for some reason or other, there was a fire in the building—the fuse plugs in the acetylene cylinders would melt at a comparatively low temperature, would release the gas from the cylinders, and the acytelene would be ignited. The heat from the burning acetylene would cause the pressure in the oxygen cylinders to increase and build up to a point where the frangible bursting discs, which are generally employed as the safety devices in oxygen cylinders, would be released, with the result that oxygen also would escape, and you can imagine what a terrific heat and blaze there would be with thousands of cubic feet of Acetylene combining with pure oxygen in the same room.

?? Questions and Answers ??

WOULD CONVERT RIFLE LATHE

Question.—I have a 16-inch swing speed lathe for which I wish information as to the cost of a cross-feed and a tail-stock for the same. This lathe is one that was in the Ross rifle factory. Please let me know if this lathe can be re-modeled so that it will cut the standard threads the same as other lathes, and if so what it would cost for the above named parts together with the necessary changes, if such changes can be made satisfactorily. I wish to ask also what the numerous different speeds of feed, which are on the lathe at present, are used for, as I understand there must be a screw shaft on the side to be able to cut thread.

Answer.—A 16-inch lathe that was used in the Ross rifle factory was probably made for special purpose in boring out small barrels. If that is the case, there was no necessity for cross carriage. It may be that the parts referred to could be purchased from the maker. The serial number of the machine will probably be found on the end or side of the ways. It is practically impossible to give much information until the make of lathe and serial number is obtained. To convert this machine as described, would run into quite a sum of money, as wood patterns would have to be made and all gears cut. The extent to which the machine could be used on threads would depend upon what train there is on the end. Whatever make it is, there would not be as many gears as there would be if the machine had been built for general purposes, rather than for rifle work exclusively. Further information might be given if more detailed description could be obtained.

STEEL AND IRON IMPORTS

Question:—Of Canada's imports during the past year, what amount was represented by metals from the United States and what from the United Kingdom? C. L., Cobourg.

Answer:—For the twelve months ending September, this year, which are the latest statistics available, iron and products from United States amounted to $107,472,696; non-ferrous metals, $28,235,357; non-metallic minerals $91,567,530. From the United Kingdom, we imported in iron and products $10,646,334; non-ferrous metals, $2 948,848 and non-metallic minerals, $7,868,461. The total exports from the United Kingdom were $127,437,704; while those from United States, $492,965,967. It is notable that for September the amount of pig iron from the United Kingdom was 2028 tons, valued at $44,851, while from the States the amount was 2,544 tons valued at $60,529. According to these figures the British pig carried an import value of $22.15, while the American pig iron cost $23.80. No pig iron was imported from the United Kingdom in September of last year.

SHIPBUILDING INDUSTRY

Question:—Have you any information with reference to employment on construction of metal steamships in Canadian yards in 1921?—C. W., Vancouver B. C.

Answer.—The number of metal ships built in Canadian yards in 1921 was 24 with a gross tonnage of 92,722 and a net tonnage of 55,917. In 1920, Canadian yards built 159,551 tons or about 112,000 tons less than in 1919. It may be of interest to know that the cost of shipbuilding in 1920 was about 275 per cent. higher than in 1913-14. There has been considerable falling off in the activity in Canadian yards since the Government's shipbuilding program was completed during 1921. Quite a number of ships have been built from time to time, for foreign interests.

CANADA'S AUTO TRADE

Question:—Please inform me as to the number of motor cars, freight and passenger, imported and exported by Canada during the past year. How does the record compare with last year?—C. W. D., Toronto.

Answer:—Statistics are available up to the end of September. Freight autos imported 1921, 1,020; value, $1,965,932; 1922, 790; value, $1,584,515. Passenger cars, 1921, 5,975; value $11,015,689. Auto parts, imported, 1921, $8,457,250; 1922, $12,042,708. Exports, freight autos, 1921, 2,929, valued at $1,555,248; 1922, 2,186 valued at $995,522. Passenger cars, 1921, 10,236, value $5. 743,435; 1922 26,909; value, $15,370,858. Auto parts exported 1921, $3,433,175; 1922, $1,559,304.

PROSPECTS IN SOUTH AFRICA

Question.—What are conditions in South Africa at the present time? Has business generally been affected there to the same extent as in Canada and other British colonies? How do imports compare with the year preceding?—J. H. W., Toronto.

Answer.—According to reports issuing from financial circles, recovery from depressing effects of the past two years has been slow throughout the Union. As regards the industrial situation, however, indications generally appear to be favorable, and there is an absence of adverse factors of importance in recent developments that augurs well for business in the near future. The agricultural outlook, thanks to the abundant rainfall of the winter months and the satisfactory tone of the European wool market, is brighter than it has been for some years, while the greatly improved position of the gold-mining industry, based upon much more healthy conditions than have existed in recent difficult times, foreshadows a period of progressive development the beneficial effects of which should be of a far-reaching character. Under present-day conditions in the Union, the industries mentioned are of fundamental importance, and their prosperity should react throughout the country. Nevertheless, complete restoration of normal trade activity can only be achieved with the alleviation of the present chaotic European economic conditions. The trade returns for British South Africa for the first five months of the year show imports amounting in value to £20,570,506 and exports valued at £21,763,312, the figures for the corresponding period of 1921 being imports £29,521,149 and exports £25,611,999. It is satisfactory to note that the figures for April and May show an excess of exports over imports of £639 285 and £504,728 respectively, the trade of the five months showing a favorable balance of £1,194,806, despite the contraction in the gold output for the first three months caused by the industrial disorganisation.

METAL SPRAYING MACHINE

Question.—During the war there was featured in your paper an apparatus used in building up shells by spraying with other metal. Will you please tell me who were the manufacturers of this equipment. I think it was described as a gun.—D., Toronto.

Answer.—This was an apparatus, which employed what is known as the Schoop process, and was handled during the war by The Metals Cooling Co., of Canada, Versailles Building, 90 St. James St., Montreal. As an example of its use, short weight shells were copper coated by this process and thus built up to correct weight.

Col. John A. Currie, president of the Imperial Steel and Wire Corporation at Collingwood, recently returned from a trip to the prairie provinces, reports that building operations have been brisk in Regina and Edmonton. Bumper crops had greatly improved the outlook so far as business credits were concerned.

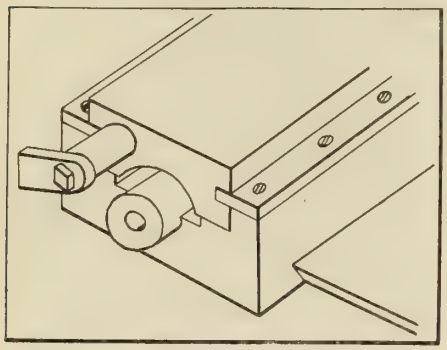
Practical Ideas From Practical Men

STOP FOR MILLING MACHINE TABLES

By D. A. Hampson

There are thousands of Lincoln type milling machines in daily use in manufacturing shops. Many of these are from a half to a quarter of a century old but, set up for one job and left that way year after year, they turn out acceptable work at a profitable price.

The usual table feed is through a nut on the underside of the table, the nut being moved by a screw which is pivoted and gear driven from the rear end of the saddle. This feed is highly satis-



Stop for milling machine table.

factory. But it seems to be characteristic of Lincoln millers to have a short screw and, consequently, a short feeding length. The result is that the operator is constantly in danger of running the nut off the end of the screw. He runs the table back to give himself more room to load and clean at the end of each cut and to keep his hands clear of the cutters, which are not usually stopped.

Every time the table is run off the end of the screw (in shop parlance, the "table" is run off and not the "nut") there is a loss of time in getting it back on again. Often it takes quite a little time and sometimes it takes an assistant. In our shop we avoid this loss by equipping all the millers with a stop. The drawing shows the stop as applied to the older machines. It consists merely of a piece of pipe, a 3-in. piece of flat stock, and a bolt tapped into the end of the table. The length of the pipe is such that the nut has a full bearing on the screw at all times. There can be no running off and, because he does not have to be careful in moving the table back, the operator works much faster—in fact the stop pays for itself in one week in time so saved, regardless of other considerations.

In the drawing the gear drive and the screw are omitted for clearness. The stop may be applied to either side or the end may be pointed downward. On some of the machines a stop made of cast iron is used. This is done chiefly in a single piece, as where a chip guard or oil basin is desired at the rear.

One of the worst losses that a table stop avoids is that of nut renewal. When the screw is turned out of the nut the last thread drags and gets burred up as well as bruising the first thread in the nut. Then, in starting on again the end of the threads chew each other up while the workman turns the hand feed as he, or some husky, pushes the table up so it will catch. If it is a babbitted nut, the trouble is aggravated. It is not an uncommon thing for a workman to complain of lost motion in the nut which, upon investigation, is found to be lost threads, for two-thirds of the nut may have been chewed away.

A stop avoids all these losses. A positive stop at the rear is better than a stop placed in the table slot on the side. The latter is not positive and it is apt to be removed when setting up the machine.

EXPANDING BORING ARMS

By Hubert Bentley, A.M.I.M.E.

The accompanying drawings show two very useful expanding boring bars for use in boring, turret and capstan lathes, drilling machines, etc. By their use the stock of tool steel is considerably reduced, there is no waiting for forging by the operator and adjustments of bore are made instantly. Fig. 1 shows the boring bar in section, with a massive square shank for bolting in the lathe tool rest, while Fig. 2, an outside elevation, has a Morse taper shank. The bar can be provided with a steady or pilot from 6 ins. to 8 ins. long, when it is desired to use the same as an ordinary boring bar, but possessing the advantage of boring any size within the top and bottom limits without change of cutters.

Before inserting the cutters CC, the expansion spindle B is pushed back into its inmost position. The cutters are then placed in the slots to rest firmly on the incline and the cap nut N is tightly locked. A loose washer W is arranged between the cutters and the cap nut. The slot hole for the cutters is shown in the small detail. A peg P, fitting in a groove in the expansion spindle, prevents the same rotating independent of the bar. To expand the two cutters, the nut A is turned causing the expansion spindle to be withdrawn and expanding the two cutters to the desired limit of bore, this being adjusted by calipers or micrometer. With the cutters set, the bar is now ready for the boring operation. In a bar 2 ft. long by 2 ins. diameter the range of bore is from 2½ins. to 3½ ins.

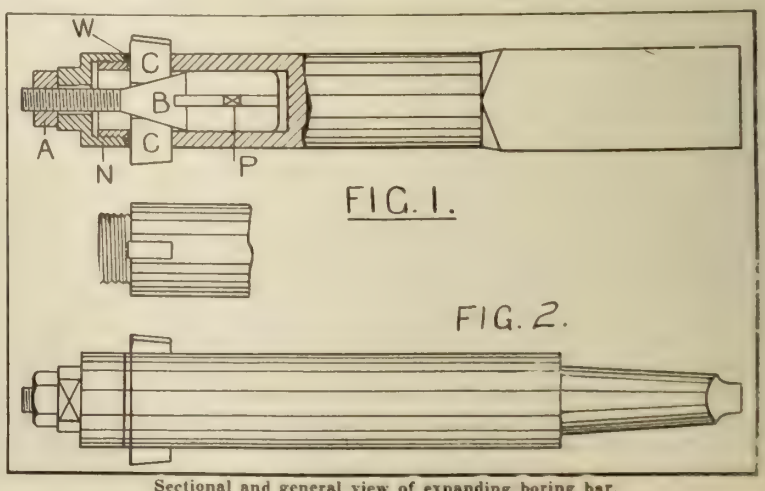
(See cut.)

VALVE SEAT FINISHING TOOLS

By Harry Moore

It requires two different tools, a rougher and finisher, to produce a good valve seat, although admittedly, very often, one tool only is used on this operation, the seats produced by the one tool method cannot be correctly termed good; at any rate not when the tool has been in use for any length of time. To state that a good valve seat must be smooth and uniform is to say something that everyone already knows, but the description of a few finishing tools designed to ensure this very necessary smoothness and uniformity will perhaps be of interest to many whose experience has not yet included this particular line of work. It should be understood the subject is herein treated as a manufacturing one, with particular reference to work of medium size.

Taking flat seats first, the principal troubles encountered are usually the difficulty of keeping the seats actually flat



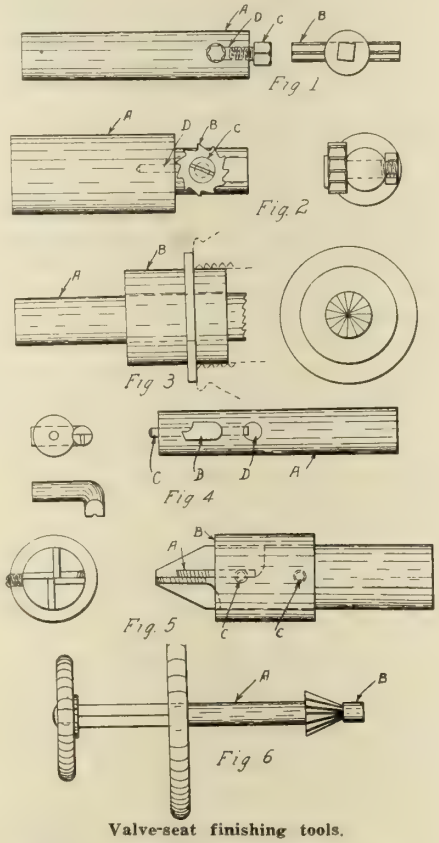
Sectional and general view of expanding boring bar.

and the annoyances connected with chattering, which once started are so difficult to stop. A very effective flat seat finishing tool is shown in Fig. 1. The shank A is drilled through at one end to take the fluted tool B which is tightened in place by screw C bearing on the Vee pad D. The length of B is such as will allow it to enter the bonnet hole in the valve and the diameter of A is equal to the diameter of the valve seat hole and so pilots the tool when cutting. A perfectly flat, smooth seat is produced by this tool when properly made, and all six cutting edges can be used before regrinding is necessary, which, since the tool is only used for finishing and consequently does not have to remove much metal, is not very frequent. The flat seat tool shown in Fig. 2 is for use on what may be called exposed seats, that is, seats made on the surface of work—the bosses on machine castings furnishing a good illustration of what is meant. The shank A, may be made any convenient size, but the front end is, as before, made to enter the valve seat hole in order to steady the tool B, which is a circular piece held on a screw C passing through the shank at right angles. A pin D is driven into the shoulder of A to prevent the tool moving under the cut. The same advantage of several cutting faces is presented in this tool.

Fig. 3 shows a simple rectifying tool for reseating flat seats, which have, for this purpose, been returned for some reason or other. It is out of the question, of course, to rechuck such returned valves in the special chucking fixtures used on this kind of work, but with the aid of such a tool as shown a valve can be reseated in exact alignment. Part A is held in the chuck of a speed lathe, and B, which is a running fit on A, is gripped in one hand while the machine is running and the valve bonnet threaded opening pushed onto it up to the shoulder. A and B thus practically take the place of the valve stem and bonnet, and when the valve is pushed up against the cutting edge of the reseat will be exactly in line with the working parts.

A raised seat finished tool is shown in Fig 4. This is used, together with a flat roughing tool, on brass castings. The flat rougher has a concave groove cut out on both sides of the cutting face, but the finishing tool has but one cutting edge as shown and better seats have been made than with a double edge tool. The shank A is drilled at right angles for tool B which is made of drill rod bent as shown, the best cutting edge nesting in a shallow groove cut in the side of A. A pin C driven in the shank from the end holds the tool snugly in place and is driven out when required from hole D at the other end. By making up a dozen tools at a time they are produced at small cost, the shank A being hardened, is used as a jig for drilling the pin holes.

A common type of angular valve seat finishing tool is shown in Fig. 5; with an auxiliary tool for removing the objectionable burr thrown up by this in operation. As shown, one flute is milled further along than the rest and a flat piece of steel A is laid on the face and held in place by a collar B tightened by screws CC. A is adjusted in or out to slightly chamfer the top of the seat and being used only for this purpose can be kept with a very keen edge. In the last figure a hand finishing tool is shown for use in cases where the work cannot be brought to a machine. Although shown with an angular seating tool the same idea can be used of course on any shaped seat. The tool itself A, is squared on the shank for about half the distance and an ordinary valve wheel driven on to the end of square. A turned down portion on the end carries a smaller wheel, resting on a washer at one side and riveted over at the other, care being taken to leave the wheel a running fit. Different sizes of pilots B are used to take care of various sizes of valves and the tool is made to cut by turning the big wheel with one hand and applying pressure on the small wheel with the other. With proper fitting pilots this tool produces a well finished seat, very little pressure being required.



Valve-seat finishing tools.

STANDARDIZATION IN GRINDING

By R. Harrison

It is clearly recognized by all parties concerned, and particularly by the manufacturers, that an adequate basis of standardization is one of the fundamental requirements which will have to be provided if the work of reconstruction in the mechanical engineering industry is to be of the permanent character so earnestly desired. With this object in view, the British Engineering Standards Association has organized a series of panels of the leading engineers of the day, who by conference, research, and direct co-operation have evolved various measures whereby the limits of inaccuracy in manufactured products may be so controlled and defined that the products of one firm will interchange with those of another.

This process of standardization, of course, involves the provision of manufacturing plant capable of turning out work with a high degree of accuracy, and it is on the precision grinding machine alone that the manufacturer can rely, to produce work of the desired quality on a thoroughly commercial and competitive basis. Absolutely alive to the importance of this aspect of modern manufacture, many firms have been investigating the various applications of grinding peculiar to their particular products, and the machine tool makers report that never before have they been confronted with so many new and varied problems. It will be readily conceded that this is an extremely healthy sign of new development, and it is in fact the best of the very few consoling features of the generally unhappy state of the machine tool industry of to-day.

The position of the grinding machine manufacturer is somewhat different to that of the other machine tool makers inasmuch that his field of endeavour is constantly and rapidly widening, the rate of progress being only impeded by the financial stringency resulting from the present extended period of bad trade.

While the above remark applies only in a minor degree to the bulk of the machine tool trade, they are further handicapped by the unburdening by the Disposal Board of war stocks of new and partially used tools, all of which find a readier market than would be the case if conditions were more normal and first cost a matter of less importance. It is, however, a noticeable feature of the second-hand market that precision grinding machines of first class command a ready sale, and this in itself is an indication of the greatly increased appreciation on the part of the smaller manufacturers of the prestige attached to a shop in which grinding is a regular operation.

Much of the rapid development in the design of precision grinding machinery attained during the last 10 years can be traced to the improved efficiency of the grinding wheel available—the position between the wheel makers and the machine makers is very much akin to that existing in the armour plate and projectile making industries—there is intense but what might also be called co-operative competition to turn out a combined product of machine and wheel with shall be as near as 100 per cent. efficient as possible. Great strides have been made in the perfection of the electric furnace process whereby the artificial abrasives are made and wheel makers are to-day in a position to supply grinding wheels of consistently good quality throughout.

Construction Features of All-Steel Power Brake

Open Throat Type of Housing—Self-Aligning Features Facilitate Reassembly—Automatic Sight Feed Lubrication—Electric Welding Used in Fabrication—Greater Speed of Operation

A MACHINE that is stated to be a radical departure from the usual design of heavy brakes has been placed on the market. The outstanding changes in the design are the adoption of steel plate, which has seldom been done before in the manufacture of heavy forming brakes, and the use of the open-throat type of housing, giving absolutely clear and extended working space in front of the machine. Another advance not evident in the cut is the use of electric welding in the fabrication and assembling of the steel. This eliminates to a large extent dependence upon bolts and rivets for combining the component parts and unites the various members into one, so as to secure the action of a solid whole rather than of a built-up section. Where bolts are used in solid members to draw the plates down into place, the bolts themselves are welded as well as the plates, so that they become an integral part of the member and all chance of working loose is gone. The necessities of convenient erection, of course, demand the use of bolts at certain connections. The number of these connections, however, have been greatly reduced and simplified both for simplicity in erection and also as an added means of securing a powerful machine.

The driving mechanism is completely contained within the housing, as in an individual press, and the housings are shipped with the mechanism assembled, so it is only necessary to place them on their foundations and attach the cross members and the drive shaft. The tool is in fact shipped as four main pieces, with the drive shaft and cross brace in addition, making a total of six parts only, which must be assembled. For erecting this machine at the plant, self-aligning features have been incorporated so that the brake will go together in the customer's shop exactly as assembled on the floor of the factory.

This line of brakes has been designed with open side in order to facilitate the handling of material. As most bends are made near the edge of the plate, the full length of the die holding surface can be utilized. Thus for most classes of work a machine can be rated with respect to the length of the die holding surface instead of the distance between housings, which means the use of a narrower, more rigid machine, and a saving in cost and floor space. In addition to freedom from all interference at the front of the machine, there is an absolutely clear space between the housings at the rear, for convenience in stacking finished work. Where more than one operation is required, the work can be passed back and forth through the machine, avoiding the inconvenience of turning end for end.

The bed and ram are constructed entirely of heavy steel plates and billets, which, together with the cross ribs, are welded to each other, thus making what is virtually a heavy solid steel beam of box section with the metal placed to the best advantage. The housings are framed of steel plate, having cast steel members interlocked and welded to the plates. These members are provided with heavy trunnions for supporting the bed. The machine is designed in the simplest manner possible for accomplishing all its mechanical operations, and all elements are combined to secure the essentials of power, rigidity, speed, and convenience of operations.

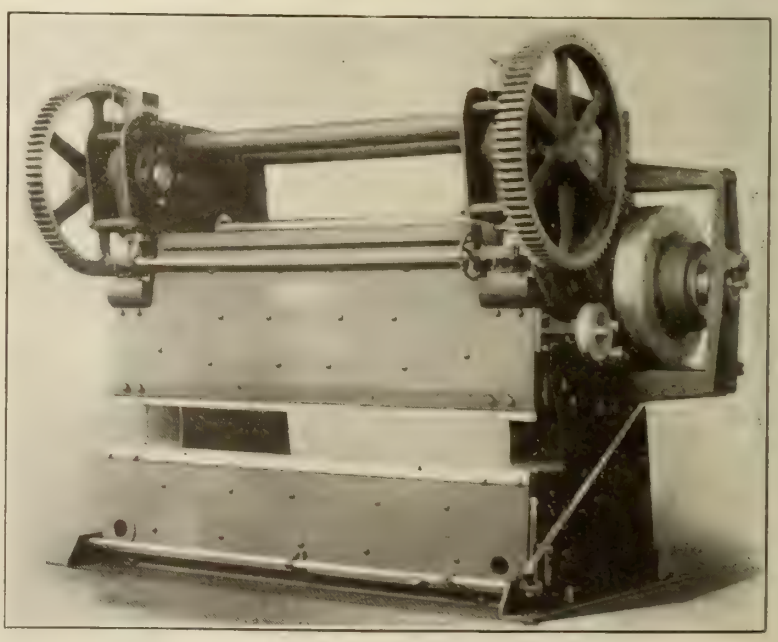
In order to determine definitely what force must be dealt with in brakes of different capacities, a series of tests on bending and forming various thicknesses of metal, under a variety of conditions, was conducted through the courtesy and assistance of the Engineering College of the University of Cincinnati. These brakes were then designed to develop the requisite power, with ample strength, and a minimum of deflection.

As the characteristics of all materials entering into this brake are well known, the whole can be properly designed and built with confidence as to its ultimate performance and avoid placing dependence upon the unknown qualities of castings. A large factor of safety is used throughout, but its purpose is not for protection against possible defects, but to provide additional strength under accidental or excessive overloading.

Automatic sight feed lubrication is provided on all power driven bearings. This is an important feature, insuring adequate oiling with a saving in time on the part of the operator. Lack of lubrication is one of the chief causes of repairs, and the resulting loss of production. The fly wheel, clutch, worm and worm wheel ram adjusting device, and the power drive for this, all run in a bath of oil. All shafts are of high carbon steel. The eccentric shafts are .50 to .60 carbon forgings with the eccentrics forged integral with them. All main shaft bearings are of special bronze. A splined trip shaft runs the full length of the machine, on which is mounted an adjustable foot treadle which enables the operator to engage the clutch from the most convenient position. The ram is gibbed endways as well as sideways. This is essential when using the machine as a gang punch.

When the machine is to be motor driven, the motor is mounted on a bracket attached to the housing. The drive is through a belt, held in tension by a weighted idler pulley on the slack side. To meet the demand for increased production these machines have been designed to operate at a greater number of strokes per minute than has been

(Continued on page 28)



All steel power press brake.

New Things in Shop Equipment

ELECTRIC CHAIN HOIST

An electrically operated material handling hoist intended for service in places where the travelling crane or the hand hoist would not be convenient or economical, has been placed on the market recently. The hoist may be transported to any desired location and easily erected for temporary service. The apparatus consists of a standard chain hoist modified in design to be operated by a small heavy-duty motor, which drives the chain block by means of reduction gearing and a slip friction clutch; all this mechanism is mounted on a malleable iron supporting bracket. While the electric-driven hoists are regularly furnished as complete units, the motor attachment is so designed as to be readily fitted to existing chain hoists. In the event of stoppage of electric power the hoist can be operated by hand in the usual manner. The devices are made in sizes to be applied to hoists ranging from ¼ to 10 tons capacity. The armature shaft and driving worm are supported in heavy-duty ball bearings and ample provision is made for adequate automatic lubrication. Only one hand is required to operate the pendant controller, the other one being free to steady and guide the load. Strength and lightness are features of construction. The weight of a one-ton hoist will be approximately 148 lbs. These electric chain blocks are made by the Motorbloc Corporation, Summerdale, Philadelphia, Pa.

HIGH-SPEED ATTACHMENT

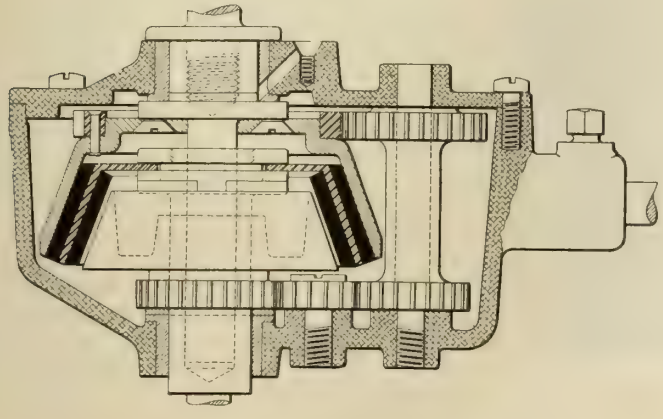
Many taps are broken just after the hole has been tapped and the tap rotation is reversed to remove it from the hole. This is invariably caused by the chips forcing themselves between the threads of the tap and the wall of the tapped hole. The stress required to overcome this resistance frequently results in a broken top. To eliminate or at least minimize this source of trouble, an attachment has recently been developed which is equipped with a friction drive both for feed and reverse. A sectional view of the operating mechanism is shown in Fig 1 while Fig. 2 illustrated a general exterior view of the device, which has a capacity for tapping holes up to 3-16 in. dia. in steel and up to ¼ in. in cast iron and brass.

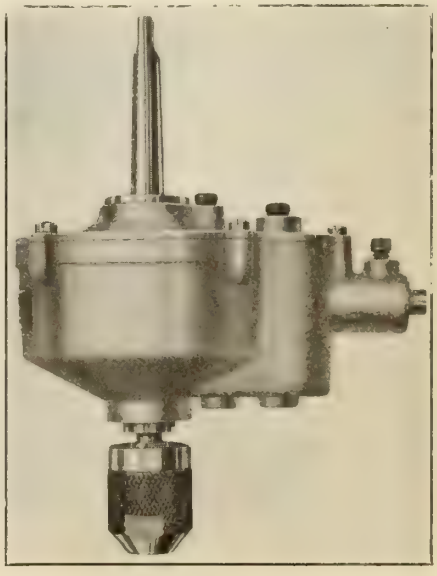
In feeding the attachment, which is placed in the spindle of a drilling machine, the chuck and the leather-faced drive cone remain stationary until the tap is brought into contact with the part to be tapped. An additional 1-16 in. movement brings the second cone into contact with the outer conical surface. The outer cone is secured to the shank of the attachment and when in contact drives the chuck spindle in the proper direction for tapping. The speed of tapping may be regulated by the degree of pressure applied to the feed-lever. When a hole has been tapped or should any undue resistance come upon the tap it stops revolving by complete stoppage of the cones. When the feed-lever is raised the tap remains stationary until the spindle rises 1-16 in. when engagement is made with the reversing cone which is driven through gearing from a ring gear on the outer cone. Should the adhesion of chips cause the tap to jam, the cones will slip as previously stated and the possibility of breakage is averted. An Oldham coupling is used for transmitting power from the cone to the chuck spindle; this connection allows the centre cone to float sufficiently to insure a uniform contact at all times with the cast iron cones. The speed ratio of feed to reverse is 1 : 2. After a little service the leather surfaces become so glazed and sensitive that they respond to the slightest pressure and slippage takes place when this pressure becomes greater than normal. The total weight of the attachment does not exceed 3¾ lbs. The distance from the chuck nose to drill spindle is 5¼ in. These chucks and tapping attachments are made by the Eastern Tube & Tool Co., Brooklyn, N. Y.

MULTI-PURPOSE ATTACHMENT

An attachment that can be used on lathes, shapers, planers and drilling machines, for performing a diversity of operations, has been placed on the market recently. It is known as the "Millerette," and is built in three sizes adaptable to lathes from 12 to 24 in. swing. By this device a lathe may be converted to do milling machine operations such as the cutting of gears, both spur and bevel, surface milling, angle cutting and spline and keyway cutting. The device is particularly serviceable in small shops and garages where a milling machine is not available, or where a small milling job is required. The device is designed to be clamped in the ordinary tool-post rest, the lathe supplying the necessary power with the cutter supported on an arbor between the centres. Longitudinal and cross feeds are provided for, both from the compound rest on the lathe and slides on the attachment. Provision is also made for swiveling to any desired angle. When used on a drilling machine the device can be used for accurately spacing of holes. The index head in connection with the change gears may be set up quickly, as only two gears are used at a time. The gears to be used for any desired spacing are indicated on the index plate; divisions are available from 2 to 360. These devices are made by the Production Machine Tool Co., Cincinnati, Ohio.

Fig. 1—Right: general view of tapping attachment. Fig. 2—Left: sectional view, showing position of driving cones and gearing.





STEEL SURFACE PLATES

A new line of hardened and lapped precision surface plates has just been placed on the market. These plates are intended for use in the shop as well as in the tool room and are claimed to have a degree of accuracy in advance of hand-scraped cast iron surface plates. When being made they are tested for planeness by means of light waves. The plates are made in diameters of 5, 8 and 10 in., and shipped in wooden boxes. The hardened surface is less subject to wear than hand-scraped cast iron plates. They are made by the Van Keuren Co., Boston, Mass.

INSIDE MICROMETER GAUGE

A micrometer gauge, primarily intended for measuring the diameters of automotive cylinders, has recently been offered to the trade. The feature of the device is the aligning base as the gauging points are exactly on the diameter when the feet of the base are resting on the wall of the bore. The gauges are made in three sizes with an aggregate range of from 2½ to 4½ in. One turn of the screw advances it 0.050 in., and the barrel is graduated to read in thousandths. Figures indicating steps of .005 in. are placed on both barrel and spindle, which act as a check for accurate reading. Both gauging points and base edges are hardened and ground. When in use the base is pressed against one side of the cylinder and the spindle turned out until the points engage the bore. These instruments are made by the L. O. Beard Tool Co., Lancaster, Pa.

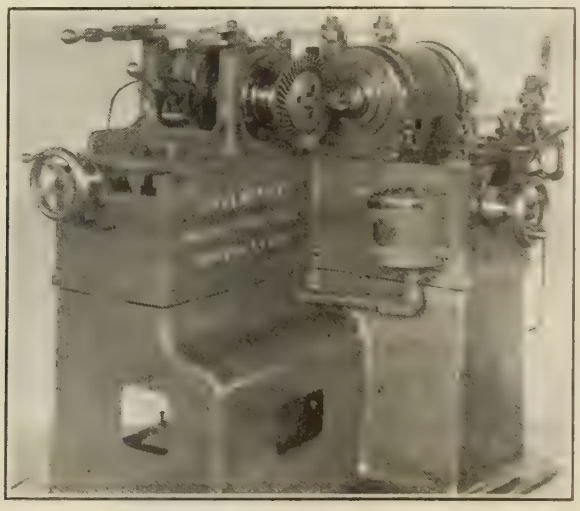
GEAR TESTING MACHINE

A machine especially designed for the testing of spiral bevel gears has been developed and placed on the market recently. In the manufacture of this type of gear it is essential that they be as perfect as possible, tests being made covering the bearing on the teeth, quiet running, and the centre distance at which they run with the best bearing and the least noise. Special attention has been paid to rigid construction of the machine and to such devices as will promote rapidity of operation.

Both of the head stocks holding the gears have large bearing surfaces on the bed and a deep dovetail slide with a taper gib the entire length of the slide. In addition to this, provision is made for tightly clamping the head stock to the bed by means of bolts passing through the head stock into blocks and T-slots in the bed. These bolts are as close as possible to the bearing, making the head stock and the bed practically one piece during the test. Inasmuch as there is usually but little adjustment on the left hand head stock—on which the crown gear is mounted—it is clamped down by a lever attached to one of the hold-down bolts with an adjustable connection to the second bolt, thus insuring equal tightening of both at the same time.

As the right hand head stock is moved quite a distance each time a pinion or gear is changed for testing, provision has been made for quickly operating this by air pressure. A cylinder is mounted on the back side of the machine which moves the slide a fixed distance and, after the slide has drawn back and the pinion changed, a new pinion is brought into mesh with the crown gear in exactly the same position at which the last one was tested, or at any other position as may be desired by the operator. This is controlled by a hand wheel with graduated dial located underneath the right hand head stock. Due to the fact that the right hand head stock is moved so many times a day, provision is made for clamping it with an air cylinder and there is also an air chuck fitted to the machine for quickly clamping the pinions.

The three valves on front of the machine are used: first, for clamping the work in the spindle; second, moving the slide so that the pinion and gear mesh; third, clamping the head stock. A similar movement of all handles performing these operations in the proper sequence, and reversing the motion of the handles, unclamps the head stock, moves back the slide and releases the pinion. Both spindles have large Hess-Bright ball bearings on each end with an arrangement for keeping the oil in the bearings at a constant height.



General view of gear testing machine.

The machine is equipped with an electric motor controlled by a switch which permits the spindles being driven in either direction. The motor is mounted inside the base, connections to the slide insuring the correct tension of the belt as the slide moves back and forth. Air cylinder exhaust, which is piped to the brake band on the crown gear head stock, cools the brake or, if preferred, water may be circulated through the brake for that purpose. The machine has a capacity for all sizes of gears used in motor cars. Four feet square floor space is required for the machine. It is operated by a 3 h. p. motor. This gear testing machine is made by the Davenport Machine Tool Co., Rochester, N. Y.

LARGE ROLL LATHE

A large roll machine, with a capacity for turning chilled rolls up to 42 in. dia. and 120 in. long, has been placed on the market recently. The lathe is driven by a 20 h.p. variable-speed motor, with a range of speeds from 400 to 600 r.p.m. The gear box is arranged for two changes of speed, and each change can be employed with the full range of motor speeds. The faceplate speed varies from 0.4 to 1.6 rev. per min. The main spindle is 7¾ in. dia., and all gears are machine cut. The machine is especially designed for heavy duty. It has an approximate weight of 17½ tons and is made by the Reading Iron Co., Reading, Pa.

ALL-STEEL POWER PRESS BRAKE

(Continued from page 26)

customary in brakes heretofore. The flywheel is mounted on high duty ball bearings having hardened steel inner and outer races. All gears are accurately cut and the pinions are of steel.

The clutch is of multiple disc type, especially designed and developed for this particular tool and operates in oil. It is accessible and simple to adjust. The clutch is highly efficient, very low unit pressures being used in its operation, and has showed some remarkable results under tests. For instance the clutch, while adjusted to pick up the full load under a standing start, that is, with the ram down against the work, has been repeatedly thrown into engagement when the dies were together, thereby stopping the flywheel in a very short period of time. The clutch has proved its ability to withstand such severe service without injury. A test of this sort is a demonstration of the action which may be expected when the dies are brought together accidentally, generally the cause of breakage in machines of this type.

These brakes are built in capacities ranging from 80 to 600 tons for working material 10 gauge to ¾ in. in thickness. The width between housings vary from 6 ft. 6 in. to 14 ft. 6 in. These machines are being built by the Cincinnati Shaper Co., Cincinnati, Ohio.

Great Scope for Industry

REPORTS that the Bethlehem Steel Corporation, and an English Sheffield firm are considering the operation of plants in Canada, are significant.

East and west, industrial growth seems closely associated with iron and steel. As the basic commodity, it identifies itself first and always with the important essentials of the country's progress. It contributes to and benefits by increasing market influence, and cannot but prove to be a strong factor in the upbuilding of specialized industry. Although the past two years have not been up to normal, manufacturers know what the country is capable of in a producing sense, and they are aware, likewise of the country's increasing importance in the matter of export trade.

For the twelve months ending September, a year far below normal, Canada imported iron and its products to the value of $119,297,888, and exported $35,000,000. Of the amount imported, $10,885,362 was in electric apparatus and $22,498,264 was machinery. Engines and boilers were valued at $5,644,117; tools, $1,258,858; rolling mill products, $26,372,403; tubes, pipes and fittings, $2,281,978; while autos represented $11,015,689. The number of passenger cars imported was 10,088, exported, 26,909. These are a few representative items that may be classified as products of iron and steel. They indicate scope for industrial development.

Clearing House for Facts

CRITICISMS are sometimes made to the effect that the Department of Trade and Commerce at Ottawa has not developed its statistical department to an extent comparable in any degree with that of the United States or other countries. Manufacturers should know that this is a somewhat erroneous idea. Up to 1918, each department of the Government looked after its own statistics, or the information relating to that particular branch of the country's business. Since then, however, this work has been centralized in the Dominion Bureau of Statistics, under R. H. Coats, Dominion Statistician. The work of the bureau has developed to such an extent that it has almost outgrown the quarters provided, and the work has been directed along such practical lines that no phase of the country's trade and industry, capable of being compiled or reduced to figures, is being overlooked in the records.

It is pointed out that Canada's expenditure per capita on useful statistics is probably equal to that of any country in the world. Notable examples are the branches relating to iron and steel, railway and general transportation, internal and external trade, agriculture and labor in general, whereby monthly surveys of the outstanding activities of the country are possible.

The bureau may be said to have its hand upon the commercial and industrial pulse of the country. Collection and compilation of information is in charge of practical men to a far greater degree than is generally supposed, and while efficiency has not reached a point that represents the actual ambitions of the department heads, much has been accomplished. Work in connection with the census is in itself stupendous, but quite as extraordinary is the extent to which it has been simplified by means of "humanized" electrical apparatus. The actual cost of census collecton last year was about $2,000,000 or 20 cents per head. Equipment used by the bureau is said to represent an outlay of $200,000.

The bureau is a place where a manufacturer may very often locate more facts about the industry in which he is engaged then he knows himself, and yet, to an extent, it represents much co-operation on the part of the manufacturer. It should be borne in mind that it was statistics and their application that contributed largely to Germany's potentiality in the war business.

Direct by Mail to Basket

SOME DAY an uncanny genius will rise up and announce the tonnage of wasted paper represented in direct-by-mail advertising which goes direct through the waste paper basket to oblivion.

The story is told of a manufacturer who tried to keep a month's record of this kind of material coming to his desk. He gave up in despair at the end of two weeks, and on looking over the list he had compiled, found that he had been invited to concentrate on the merits of the following: Phonographs, oriental rugs, lubricating oils, electric beaters, electric heat-treating furnaces, shop equipment and furniture, monthly calendars linking up works of art with small tools, roofing materials, fertilizers and furnaces and a host of literature advising him about opportunities in gold mines and industrial ventures.

Much of the material, he said, should never have been distributed to business offices, but was really intended to reach members of the staff; much of it, he admits, came in attractive and expensive form. None of it had an appeal because when it came to buying an article, he preferred to see what the other fellow had to say. This he could only find through his technical papers. There he had his market, with the merits of the different wares intelligently discussed, and there he found his most practical buying guide. He eliminated direct-by-mail from his advertising appropriation. So far as he could see, it was diverting but had no merit in what he described as the competitive buying information so essentially available in business papers.

Deliveries Weeks Behind on Large Steel Tonnages

Production Continues Slightly Above 75 Per Cent. Capacity—Motor Trucking Being Resorted to for Urgent Delivery—Corporation Has Seven Million Tons Unfilled Orders

STEEL HOOPS STRONG IN SHORT MARKET

SURVEY of conditions and trends in the Pittsburgh steel markets indicates that both buyers and sellers have had their innings on a somewhat even basis. Since April 1, it is pointed out, everything has been in favor of sellers, and mills are today reporting less irregularity in prices. An example of this is found in bars, shapes and plates in which the $2.00 price is being sustained. The Steel Corporation shows 6,902,287 tons of unfilled orders. Deliveries on Canadian contracts have been running behind with little sign of improvement. The demand has slackened in the past few weeks, particularly on structural material. Not only is the Corporation pretty well sold up, but some of the larger independents report that their present bookings are good for two months at possible rates of delivery. Steel output continues at about 75% of capacity.

Demand for such building materials as merchant pipe still continues strong and the mills are under pressure for supplies of material. Skelp is coming through slowly in little more than hand-to-mouth quantities, and movements cannot be accelerated by making Canadian cars available. It is reported that motor trucking is being resorted to in some sections of the States and that deliveries are being made as far west as Detroit from the eastern steel centres.

Toronto market is now fairly well supplied with sheets and bars and the prices are practically unchanged since last week. Quite a movement is developing in steel hoops and a shortage seems imminent. Prices have stiffened, the range being from $4.50 to $4.75.

In pig iron and non-ferrous metals the situation suggests very cautious buying on the part of foundries. The drop in domestic pig iron of $2.50 a ton has not accelerated the demand, in spite of the fact that production costs trend slightly upward. The mills express the opinion that $25 pig iron, by the end of the year, is ridiculous and there are those who advise buying to cover a reasonable period, say three months. Copper is assuming a stronger position in the market, while tin is holding at high levels, as the result of Old Country speculation. There have been fluctuations in this market but there is nothing to indicate lower price bases.

Pittsburgh reports a downward movement in coke prices—ranging from 25 to 50 cents. Foundry pig iron, valley furnaces, is down from $29 to $27.50, while Bessemer remains at $32. Buffalo is quoting foundry iron at $27 and can, therefore, ship pig iron into Pittsburgh on the same basis as valley.

Not much can be said with regard to the demand for machine tools. Mill supplies, particularly steam goods, are moving well. On certain lines of millers and shapers an advance of 10 per cent. has been made.

Montreal markets report a fair volume of business, but that supplies of certain lines, especially semi-finished steel, were on a somewhat precarious basis. Relief was secured, in one instance, by sending empty cars to the mills. Shipping difficulties do not indicate that relief can be hoped for from this direction with any degree of confidence.

Toronto

November 22, 1922.

THAT there has been an improvement in general business in the past week, is the report in the iron and steel market. The forepart of November seemed to indicate that the advent of cold weather would cause a serious falling off in demand, especially on those lines used for structural purposes. There was a slight lapse and, as one salesmanager put it, "there was a feeling that we were in for a bad month," but a change for the better has set in. As might be expected, the month may not average up with October and September, but there is no reason for discouragement. Although buying is going along cautiously, the demand is steady and conditions are such as to maintain prices. There is no factor developing that might have a tendency to upset the stability of the market. There is quite a short supply in some lines, due to poor delivery, and this phase of the situation promises to have little betterment. Statistics on the production of iron and steel show that there has been a slight improvement in last month's production over that of the month preceding, and though the level is at the lowest in some years, the movement is upwards.

Iron and Steel.—The one item that appears entitled to any prominence at the present time is that of steel hoops. The market has been fairly well supplied up to two weeks ago, but stocks have gradually diminished and dealers have had to make replacements. The Pittsburgh price ranges from $2.90 to $3, and at the Toronto price of $4.50 it is claimed that the margin has become somewhat close. The range, therefore, swings upward, from $4.50 to $4.75. Boiler tube demand is still a feature of the market with prices firm, while sheets are easier owing to improved supplies. Bars are meeting with a steady demand and while instances are known where as low as $3.15 has been quoted, the market appears to be pretty well agreed on a range of $3.25 to $3.40. Current prices:

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 75
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		3 95
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 25

Non-Ferrous Metals.—Foundry demand is reported to be somewhat spasmodic, but representing on the whole a very fair volume. The interesting phase in ingot metals is hardly the local demand so much as the features of the world market. Tin has been passing through a rather strenuous period of speculation, and while it has come out of a series of fluctuations a trifle easier at times, the average has been well maintained. The trend of the copper market is upward, with the minimum price in New York well established at 13.87½. Output at the mines has been steadily increasing. Germany has been best foreign buyer while France and England have been taking fair tonnages. Local prices:

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

Old Material.—This market, in a sense, reflects conditions in the pig iron market. There is very little pronounced movement. Blast furnaces are not the heavy buyers they usually are, and it is hinted that some adjustment of prices may be necessary before they appear as strong factors. However, it is held that a more normal business situation would correct the problem, and that supplies of old material are not so plentiful as to warrant radical price changes. Buffalo reports a strong demand for railroad malleable and machinery cast iron and that the visible supply is quite limited.

Dealers' average buying prices are as follows:

Copper, light	9 00
Copper, crucible	11 50
Copper, heavy	11 50
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton.	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Pig Iron.—Recent reductions in pig iron prices have not caused any marked activity in this market. Foundries are doing very little advance buying, while producers state that costs are increasing, rather than easing to such an extent as to warrant further reductions. It is stated that the prospect of reduction below present figures is very remote.

Owing to scarcity, turpentine maintains a high figure of $2.25 per gallon in single barrel lots. Raw linseed oil is quoted at $1.03.

Machine tool demand continues somewhat featureless. There is an occasional sale and there is fair inquiry. Price advances of 10% have gone into effect on certain makes of millers and shapers. Lathes have not been affected. The supply business is good. Quite a strong seasonal demand for steam goods has developed.

The transportation problem, so far as it affects materials from the other side, shows no improvement. One large mill reports that it is practically running only from day to day. In this particular instance there is a shortage not only of materials but great difficulty in securing supply owing to demand in American markets.

Montreal

November 23, 1922.

NOTHING of more than passing interest is to be reported this week from this district. There have not been any price changes and on the whole the demand for steel commodities has slackened off a good bit. This was expected in most quarters but is believed to be only of short duration.

Some of the large manufacturers here who are wholly dependent on supplies of semi-finished steel from Pittsburgh were able to persuade the Canadian roads to send a supply of empty cars to the mills for the transportation of material which was in storage awaiting shipment and secured relief in this way. But it is realized that this cannot become a general practice, and the smaller interests throughout the country are suffering severely from the inability of the American mills to secure cars for the shipment of material. It is reported that the system of trucking material from the Pittsburgh district mills, so highly developed during the war to relieve the railway situation, is again coming into existence and tonnage is being trucked as far as Boston and Detroit.

Iron and Steel.—Buying has been so good for the past several months that a temporary lull in demand is not surprising, and when the large supplies which have recently been imported from the Old Country mills, particularly galvanized sheets, black sheets and pig iron, have been absorbed, fresh buying is sure to develop. Shipping difficulties at the several American points of shipment are increasing and are undoubtedly becoming worse without any promise of betterment. A new departure has been inaugurated by a local warehouse firm which will fill a long-felt want on the part of machinery and allied manufacturers, that is—the stocking of large steel bars up to 12 in. dia. The largest side bars rolled in Canada are about 5½ in. and in the U. S. 7 in., but the British mills can produce up to 12 in. and a complete range of sizes up to this limit is now available here, and the price is understood to be very reasonable. Local prices:

Iron bars, base	3 15 to 3 25
Steel bars, base	3 15 to 3 25
Reinforcing bars, base	3 15 to 3 25
Steel hoops	4 00
Tire steel	3 25 to 3 40
Spring steel	7 00
Band steel, No. 10 gauge and 3-16" base	3 65 3 75
Small shapes	3 40
Sheets, black, No. 28	4 75
Shets, blue, ann., No. 10	4 10
Canada plates, dull, 52 sheets	5 50
Canada Plates, all bright	7 00
Galvanized Sheets, No. 28	6 50

Pig Iron.—The recent reduction in the price of Canadian iron has not stimulated fresh buying owing chiefly to the fact that foundries are presently well supplied and the market cannot consume new tonnage. The importation of Scotch and English brands has ceased with the close of sailings to the St. Lawrence, and on fresh demand developing later on Canadian pig will control the market.

"The reduction in price of Canadian pig iron recently made," a dealer states, "has stimulated inquiries somewhat, but, as yet, actual purchase does not seem to have increased, as prices on English and Scotch iron are still below Canadian prices in Montreal and district." Local prices:

Algoma, No. 1, car lots on tracks, nominal quotation		36 15
Summerlee, 30-ton lots, dock	35 00	
Carron, 30 ton lots	35 00	
Do., 5 ton lots, ex. warehouse	40 50	

Non-Ferrous Metals.—The ingot metal situation is somewhat easier this week than it has been recently and there is little doubt but that zinc has probably reached almost its highest point. The reaction in tin is not surprising in view of the sharp advance, but while it may go off slightly further, we would not be surprised to see a fresh advance in a week or two.

With regard to the practices made by dealers in ingot metals with regard to the tendency on the part of large manufacturers to import direct, thereby avoiding a 2¼ per cent. tax as from wholesaler to manufacturer, a Montreal dealer states: "This tax applies not only to ingot metals but to all goods. At present we are forced to sell as far as possible for direct import from abroad to the manufacturer here, who pays 3¾ per cent. tax when passing entry. We are, of course, compelled to carry a certain amount in stock on which we also pay the same tax and then charge a further 2¼ per cent. on sales from stock. It naturally places a penalty on our stock business and as such is objectionable, but the situation has gradually righted itself having been in force now for some time, and while we would like to see this removed there is no particular objection on the part of the trade here. As previously mentioned, this does not apply to tin alone, but to all imported goods, and if there is any talk of going to Ottawa to make a protest we think it is a waste of time."

Local prices in the non-ferrous metal market follows:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	40 00
Lead	7 50
Spelter	9 50
Antimony	7 50
Aluminum	22 00

Pittsburgh

November 22, 1922.

OPERATION of the steel industry continues at slightly above 75 per cent. of capacity. There are no striking cases of any mill curtailing its output on account of lack of orders, although a month ago it seemed not entirely improbable, on account of the heavy shipments being made, that something of this sort would occur well before the end of the year. Thus the situation from the mill standpoint is perhaps somewhat stronger than might have been expected. Another point is that mills report less irregularity in prices of bars, shapes and plates than a week ago, i.e., the 2c market price is being sustained better.

That it is no foregone conclusion that the steel market has to stay strong, with producers having continuously the upper hand over consumers, is obvious from a survey of conditions and trends. In the long run the alternate innings of buyers and sellers even up rather well, and since about April 1, the date when the coal strike began, everything has been in favor of sellers.

Large Tonnage Absorbed

The situation as to production and consumption can be put in clear and concise form. In 1921 there was drastic liquidation of material, both stocks of steel in the hands of buyers and stocks of manufacturers of steel, including

hardware, tools, agricultural implements, machinery, etc. Production of steel ingots was about 19,000,000 tons against about 41,000,000 tons in 1920. The country must have been practically bare of stocks of all sorts April 1 of this year. From that date to October 1 the production of ingots averaged 34,500,000 tons a year. Consumption could not have been at a greater rate than the production, there being no stocks to draw upon. Since October 1 production of ingots has been at a rate of 40,000,000 tons a year, or 15 per cent. more. If steel is not growing more plentiful it has to be shown that consumption, with winter approaching, is considerably greater than in spring, summer and early autumn, and that is something that does not normally occur.

The Steel Corporation's last report showed 6,902,287 tons of unfilled obligations, equal to nearly six months of production at 75 per cent., though, of course, the orders and contracts are not equally distributed among the different departments. At any rate, the Steel Corporation is really very well sold up. For a long time the independents, as a whole, have not had nearly as heavy order books, partly because their prices have frequently been higher than those of the corporation.

In some quarters it has been expected of late that before the end of the year some of the independents would find themselves with so little business that they would have to choose between curtailing operations and going out to seek additional business by the price-cutting route. The common opinion has been that in such case choice would be made of the latter alternative. At the present time, however, some of the large independent mills that were supposed to have the leanest order books state that they can run for two months at their present rate without booking additional business. Then the question arises whether their customers will continue to take shipments at the present rate. Some of them may ask shipments to be curtailed or discontinued for a time. There have been such experiences in the past, two years ago, for instance.

Building Materials Strong

There continues to be pressure upon pipe mills for better deliveries of butt weld merchant pipe, both black and galvanized. The mills seem to be considerably in arrears. Wire mills are likewise under some pressure for delivery of nails. They are said to be six weeks behindhand in nail shipments. It is only in these two lines that mills are under pressure. In other finished steel deliveries seem to be fully adequate and as indicated above there is room for suspicion that customers may suggest before the end of the year that the rate of shipping be reduced. The pressure for small merchant pipe and for nails reflects, of course, the remarkable boom that has been in progress for nearly a year in garage and dwelling house construction, a boom that seems to be quite lively still.

The market is quotable as follows: Billets and sheet bars, nominal at $38, Pittsburgh or Youngstown; bars, shapes and plates 2.00c; ordinary hoops, including cooperage stock, 2.90c, with higher prices for narrow hoops and light gauges; black sheets, 3.35c; galvanized sheets, 4.35c to 4.50c; blue annealed sheets, 2.50c to 2.75c; plain wire, 2.45c; wire nails, $2.70; merchant steel pipe, 66 per cent. basing discount.

Coke and Pipe Iron

Connelisville furnace coke is down 25 cents and foundry coke 25 to 50 cents in the week. Furnace coke of good grade can be picked up at $6.75 to $7.25, according to tonnage and delivery. A week ago foundry coke was quotable at $8.00 to $9.00 according to brand, the $9.00 price being for the best brands. These are now quotable at $8.50, the concrete development being the announcement that Jamison coke on adjustment contracts would be priced at $8.50 beginning November 16. Ordinary brands, merely of standard quality, can usually be picked up at $7.75, or 25 cents lower than a week ago. This is standard coke. There is off-coke at less.

The further decline in furnace coke does not particularly please the furnaces now in operation, for the reason that on the drop some five weeks ago from a firm level of $12 to a range of $8.00 to $8.50 the furnaces covered pretty generally to the end of the year. They cannot take advantage of the lower coke prices to any extent, while the decline in coke exerts an adverse sentimental effect on pig iron, which is weak and declining in all districts. Foundry pig iron at valley furnaces is down from $29 to $28.50 and is by no means strong at the lower price. Basic, quotable nominally a week ago at $29, valley, has sold at $28, valley furnace, while Cleveland furnaces are understood to have sold to Massillon and Canton at prices that it would require $27, valley, to match, so that basic is weak or nominal at $28, valley. Bessemer remains quotable at $32, valley.

Iron Down at Buffalo

Buffalo foundry iron is down to $27, furnace, and Birmingham is off $2 to $23, Birmingham. At these prices, with valley foundry at $28.50, all three districts can put pig iron into Pittsburgh at approximately the same price, an unusual alignment and one that makes Pittsburgh consumers expect lower prices on valley iron, apart from their expectation of lower prices on account of production being heavier and coke declining. Naturally inquiry is very light and is confined to the supplying of immediate necessities, which are not large on account of the deliveries now being made on old contracts.

According to government figures for 1920, the pulp and paper industry employed an invested capital of over $347,000,000, of which slightly more than half was in the Province of Quebec. In the first six months of 1922, Canadian mills produced over 516,000 tons of newsprint as compared with 612,000 produced by United States mills. The Canadian newsprint output during this six months period is stated to have been 93.6 per cent. of mill capacity.

Electrification of railroads in France calls for a program by which a 200-mile stretch is to be completed by next summer. Ultimately there will be 6,000 miles in operation, by which time France will have developed her waterpowers.

Cheap Roller Bearings:—The success of ball bearings on bicycles and other light machines led inventors to design a more powerful type of bearing for heavier machinery. Rollers were substituted for balls so as to afford greater strength and larger bearing surface; and in many cases great success has been achieved by their use, especially where economy of power is of great importance. The development of the roller bearing has, however, been hindered by its high initial cost. Consequently, it is good news to many engineers that a British firm has evolved a simplified form of roller bearing which competes with the ordinary solid bearing in price. The usual plan is to arrange the rollers in a cage, but in the new bearing the rollers are kept in position by intermediate distance pieces which are held in alignment by two projections which run in curves and thus serve the double purpose of keeping the distance pieces in line and of acting as oil rings. With the aid of this bearing the highest economy can be secured without heavy initial expense.

The total value of exports from Canada to India during the five months ended August, 1922, amounted to roughly $500,000 as compared with $650,000 during the corresponding period of 1921. This drop is probably accounted for by the fact that some special railway material was imported in 1921, while no Canadian railway materials so far figure in this year's returns. If the value of a cargo of 130,000 creosoted Douglas fir sleepers delivered at Madras a few weeks ago, were included, the figures for this year would now be in advance of last year. The export of Canadian-built motor cars shows a marked improvement over last year, 446 cars being imported from April to August this year as compared with only 165 during the corresponding period of last year. The increase of the tariff in March of this year from 20 per cent. to 30 per cent. ad valorem has had the effect of encouraging the importation of the cheaper American and Canadian built cars at the expense of the higher-priced English cars. Only 96 English cars were imported into India during April to August this year, as compared with 207 during the corresponding period of last year.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

Toronto price:—

Silicon, 2.25% to 2.75%	$33.80
Algoma, No. 1, Montreal	36 15
Summerlee, Scotch, Montreal dock	35 00

News From the Industrial Field

Building permits issued by Toronto City architect for the past ten months amounted to $5,000,000. For the first half of November permits amounting to $260,-500 were issued.

Ore shipment by water will wind up about Nov. 25, according to reports from Cleveland. Boats have been lined up for all the ore that will be sent forward.

The Imperial Oil Co. has just completed two large storage tanks at Sydney, N. S. This will form part of the plant now being erected. These tanks have a capacity of 10,000 gallons each.

Business activity in Montreal is reflected in the increased number of incorporations recently. During the past two weeks the authorized capital of new companies formed aggregate approximately $44,000,000.

Asbestos mines near Thetford, Ont., are operating on an average of 50 per cent. capacity. Operators report that enquiries from the iron and steel and building industries are good. The outlook is better than for some time.

Development of the Lackawanna Steel plant at Buffalo is now proceeding on a large scale. Enlargements will cost $15,000,000. Charles M. Schwab gives as a reason for this expenditure the prospect of an era of prosperity directly ahead.

Canadian National Railways recently let contracts for over one million ties. This order will mean something to the lumbering industry. It is stated that operations in all the camps this winter will be one-third to one-half greater than last year.

Walkerville:—Owing to a so-called price-war, manufacturers of twist drills in this district declare that lower-than-cost levels make business somewhat unattractive. The Canadian Detroit Twist Drill Co. here are fairly active. They ahave a motor valve department employing three men at present.

Shipping at the port of Montreal has taken on considerable activity during the past few weeks as compared with corresponding period of last year. Customs and excise receipts for October at the Port of Montreal amounted to $8,-452,171, and represented one of the biggest month's business in the history of the port. This is a gratifying increase as compared with October, 1921. and September, 1922, when the totals amounted to $5.950,913 and $7,232,830 respectively. In one day collections totalled $1,029,312.

Boiler insurance companies are giving the question of fuel costs some attention and their inspectors are making good suggestions by way of regular service. One manufacturer saved 35% in overhead by making certain alterations and adopting methods that were brought to his attention in this way.

The Wear-Rite Textile Co., Toronto, are building a two story brick factory costing $100,000 at the corner of Empire Ave. and Queen St. E., Toronto. It is understood that they intend making cotton and wool-combing products when the factory is completed. J. E. Hoare is in charge of the Toronto office.

Next week's issue of Canadian Machinery will contain the second article by A. Luenberg on factory costs. The subject discussed will be "Prime Cost and How to Find It." The article will contain proper forms and charts adaptable to practical use.

Walkerville:—It is understood that the plant of the Walker Twist Drill Co. is to be sold. At present it is occupied by Canadian Production Tool Co., who have 15 men employed. Running on normal basis the former Walker Twist Drill Co. employed about 200 men.

Walkerville:—General Motors production schedule for the coming five months exceeds that of the same period a year ago. Although fewer men are employed, production is greater. With 800 men as against a high peak of 1,200 more units are being turned out than at any previous time. The whole plant is practically on a piece-work basis.

Ogden R. Adams of Rochester, N. Y., who for the past eighteen months has been associated with the Seneca Falls Mfg. Co., in the capacity of president and general manager, has severed his connection with that corporation, his resignation becoming effective Nov. 1st. Mr. Adams will hereafter devote his entire time to his business interests in Rochester, Buffalo and Syracuse.

"Cut-throat competition is not included in the perfect competition of economic theory. As economic competition is directed to gaining some economic advantage from a particular sale or purchase, it will always cease when economic gain is completely eliminated. It does not involve defeating one's rivals at whatever cost."

Walkerville:—Former Windsor Machine Tool Co. interests are considering a proposition to locate in St. Thomas or Tillsonburg, when they would operate a plant on pistons and piston rings.

Brantford Brass Foundry Co, which last winter operated in a small brick structure, subsequently added a machine shop and storage shed. Part of the latter was converted into a core room, and at present an extension of the foundry building is proposed. A staple line of products, builders' hardware and artware is being established. The furnaces are fired with fuel oil instead of coke.

That Canada will require 80,000 motor cars yearly in replacement needs and that farmers own one-third of the cars in Ontario, is the report that Felix S. S. Johnson, U. S. consul at Kingston, makes to Washington. Approximately 500,000 passenger cars and trucks have been turned out of Canadian factories during the past six years.

That surplus machinery of Canadian plants be distributed in the United States where the industrial revival has created a demand for machine tools, is suggested by Frederick Hudd, Canadian Trade Commissioner, New York. Production machinery has been but slowly absorbed in Canadian plants since the post-armistice boom. Large tools and rebuilt woodworking equipment he says is in demand on the American market.

It is the opinion of K. L. Swenson, secretary Rockford Lathe and Drill Co., Rockford, Ill., who was in Toronto recently arranging agency connections, that while there is a great amount of used machinery moving, manufacturers are beginning to realize that this is not the kind of equipment that will be required when industry recovers its normal stride. Already there is an increasing enquiry and movement in high standard equipment.

Walkerville:—Ford Motor Co., are soon to award contracts for the proposed extension to their plant. A notable change is being made at present by the conversion of their 2,200 machines from belt to direct motor drive. Direct motor drives are required and it is understood that the contract for the work has been secured by the Westinghouse Co. Equipment of the new plant will represent a large investment in machine tools, but dealers state that there will be no move in this direction before spring.

MUCH STEEL USED IN QUEBEC CONTRACTS

Quebec.—Prior to 1910 there was very little steel used in building construction in this city and district. This being the center of the timber and lumber trade, wood was almost exclusively used in construction work. With the establishment of the Eastern Canadian Steel and Iron Works, Limited, in Quebec in 1910, there came a change. This plant is practically owned by local capital, with Edmund Taschereau, president, Arthur Picard vice-pres., and Thos. G. Leonard, general manager. The plant is adjacent to the C.N.R. St. Malo shops, and has up-to-date equipment for the fabrication of steel. It employs 150 workmen, and uses on an average of 1,000 tons of steel per month. The plant has, at present orders on hand to keep it busy until the end of February. As indicating the relations existing between employers and employees, it is sufficient to say that not one difficult situation has arisen since the opening of the plant to the present time.

Thos. G. Leonard, in an interview with your correspondent, discussed business prospects and the condition of labor in connection with the plant. They had furnished the steel for the building of several bridges, including a cantilever over the Saguenay for the firm of Price Bros., Ltd., which took 325 tons of steel, bridges in the counties of Levis and Champlain and others in the province. They had also supplied 1,500 tons of steel for the New Bank National building; 350 tons for the addition to the parliament buildings; 350 tons for new Quebec court house; 250 tons for St. Sacrament church; steel for viaducts and bridges on provincial highways; for the monastery of the Redemptorist Fathers; for the new college at St. Anne de la Pocatierre and Rimouski and the institute of Ste. Anne de Beaupre.

Speaking of labor conditions, Mr. Leonard said: "We have not had the least difficulty with our employees, who are all French-Canadian, good and steady workmen." Pointing to a regular village, a short distance away, surrounding the plant, Mr. Leonard said, "That sight is sufficient evidence to show you the class of workmen we have in our employ. When we established our industry in this locality, to be close to the C. P. R., there was not another dwelling within a quarter of a mile of our plant. These buildings were practically all built by our workmen and their families. This is a living example of the sane mentality of labor in Quebec."

Discussing the facilities for steel construction in Quebec and district in the future, Mr. Leonard said he had good hopes, as investers were building these days to escape the high cost of insurance, and was fully convinced that from now on, all public and big business buildings in Quebec would be of steel.

FACTORY TO TILLSONBURG

Tillsonburg.—Wilkie Products Co., Limited, representing interests formerly associated with Windsor Machine Tool Co., Windsor, Ont., are to be given aid to establish a factory here.

The company asks a free site to cost not more than $1,000, exemption from taxation except for school purposes, and a guarantee of their bonds to the value of $40,000. As security they will give the town a first mortgage on the land, buildings, $100,000 worth of machinery and equipment, which is considered to be ample security against loss in any event that might occur. They will build a modern factory 200 x 400, one-storey brick to cost $40,000. The company agrees to repay the bonds in 18 equal instalments, with interest at the rate of six per cent., and to employ not less than 50 hands within a year.

The products they will manufacture are staple articles, in constant demand the entire year, piston and piston rings as the main products to be manufactured. In addition to their own hands, they will require a tonnage of 40 tons of casings per month, which will necessitate many extra moulders in the local foundries. There is every indication that the bylaw will carry by a big majority, in which case at least 50 new houses will be required in the spring as the house shortage is acute at the present time, despite the fact that Tillsonburg has enjoyed one of the best building seasons in the history of the town. If the by-law passes, the board of trade will immediately deal with another excellent industry, with every indication of locating them by spring.

Port Arthur.—A terminal elevator with a capacity of 1,500,000 bushels will be erected here by James Stewart, president of the Maple Leaf Flour Mills and of the James Stewart Grain Company, according to authoritative information. The cost will approximate $850,000 and construction will be commenced during the forthcoming Winter. The site selected is near the Thunder Bay elevator.

Sarnia.—Dominion Alloys Steel Corporation, who propose erecting a three-million dollar steel plant on the St. Clair river below the city, are making payments to the Indians on the Sarnia reservation on the $200,000 purchase price for the required site. Individual payments range from $350 to $3,500, and those Indians who have not other holdings will purchase new land on the reserve. It is learned that the industrial site will be surveyed and cleared forthwith, and the development will entail the closing of the river road in the spring. The plans foreshadow great industrial development along the St. Clair River front, as, besides the Steel Corporation, the Wills St. Claire Company, automobile manufacturers, of Marysville, Michigan, and other industrial concerns, are interested in property in this vicinity.

PUMP CONTRACT LET FOR BIG B.C. PROJECT

Montreal.—Dominion Engineering Works, Limited, have been awarded the contract for pumping equipment in connection with the Sumas reclamation project. The work calls for four 54-inch spiral vertical type centrifugal pumps, two of which will be driven by speed moters capable of developing 1,250 h. p., the other two by three speed motors, each capable of developing 485 h. p. at the highest speed.

The pumps will be used in connection with the lagrest reclamation of dyking scheme of the kind ever attempted in Canada. Its success will mean the establishment of one of the greatest dairying centres in Canada, the farmers having the advantage of every modern convenience, both in their dwelling houses and in their farm buildings.

Power lines have been brought down to the mouth of the Sumas River and the Vedder Canal from the British Columbia Electric Railway Company's main line to Chilliwack, and no building will be without electric light and motor power.

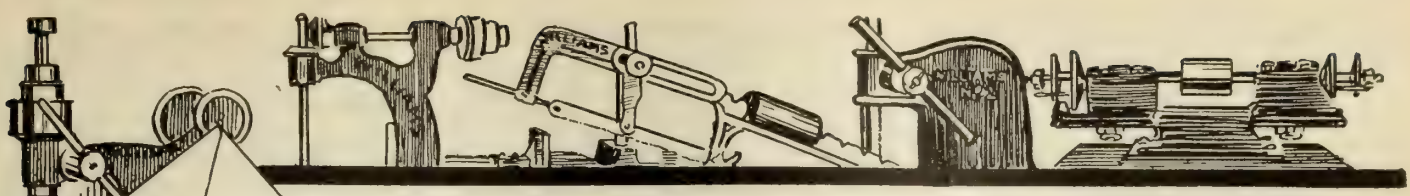
The Vedder Canal is deep enough to permit of river boats like the "Skeena" calling for produce, and there are two railway systems at present operating, one on either side of the prairie. Sheltered between the Vedder and Sumas mountains the climate of the prairie is ideal, and hay has been cut as late as November at times.

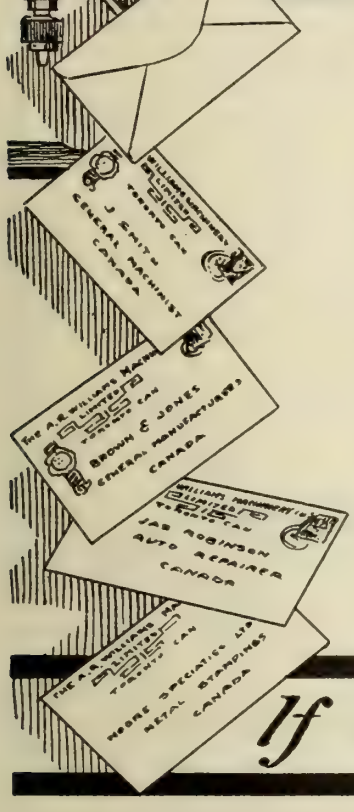
According to a report from Vancouver, the work involves the erection of a dam on the Sumas river. Five big pile drivers recently have been hammering in the piles for reinforced concrete foundations of the dam, which will be four hundred feet wide, when completed.

With the emptying of the Sumas Lake, no longer fed by the Vedder River, the pumps on this great dam will have to take care of the water from the Sumas River and the Sumas Lake canal, together with all drainage water flowing into them. The Sumas River is not a large one, and the Sumas Lake canal will only carry drainage water.

The Sumas River dam will not only have to take care of the water mentioned, but in conjunction with the Sumas River dyke, which joins the west dyke of the Vedder Canal, it will have to bear the brunt at Fraser flood times. The Fraser will back up the Vedder canal and the Sumas River as far as the dam. It is for this reason that the dam is considered the key of the whole stuation, and the government has gone to considerable expense in taking special precautions at this point.

In order to make room for British exhibits, it is now proposed to make additions to the Pure Food Building at Toronto National Exhibition, costing $100,000. The addition would give 19,000 feet more exhibition space.





We have that machine you need

No matter what your requirements, our huge stock of Metal-working, Wood-working Machinery and Supplies assures the prompt and intelligent filling of your order. Just now we have some extra good "buys" in re-manufactured machinery—each machine guaranteed to be as good as new for all practical purposes. It will pay you to investigate.

Let us put your name on our mailing list for our Monthly Machinery List.

ARMSTRONG Safety Clamp Lathe Dogs

THIS Dog is so constructed as to combine a wide range of adjustment with the convenient features of the Clamp Dog and the Simplicity and Strength of the ordinary Lathe Dog.

It is specially adapted for use on finished work which would be liable to be damaged by the set screw of a common Lathe Dog.

A distinct advantage of this Dog is that it can be applied without removing work from centres.

Ask for Catalogue B-20.

PRACTICAL SAFE AND WELL BALANCED

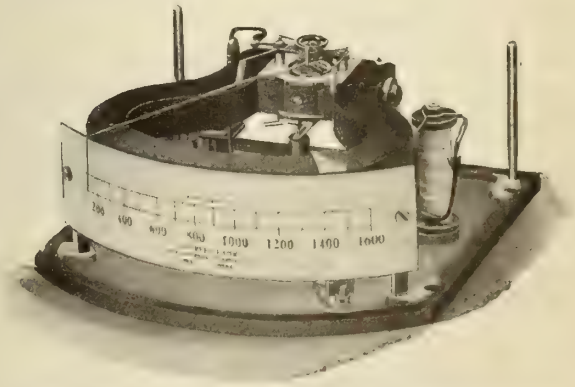
STRONG STRONG

PYROMETER



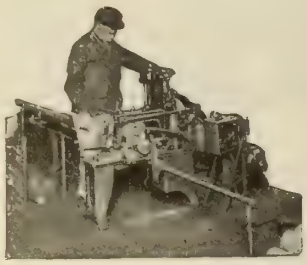
ANOTHER FACTOR FOR ACCURACY

The Bristol Automatic Cold End Compensator with which our pyrometers are now equipped serves merely to increase the precision of instruments already recognized for their accuracy. This exclusive feature is a simple device located within the instrument itself which automatically compensates for any variation in the temperature of the cold end. The full details are in Catalog I-1401. Now at your service in Philadelphia.

THE BRISTOL CO., Waterbury, Conn.

Canadian Distributor:

A. H. WINTER JOYNER—Toronto, Montreal



SIMONDS

HACK SAW BLADES

Hack Saw Machines equipped with Simonds Blades produce more work at a minimum of expense. These blades cut rapidly, hold their cutting edge longer and do not shell teeth.

They are made of special steel and heat treated by an exclusively Simonds method to bring out the utmost in cutting efficiency and lasting qualities.

Write for catalog and prices.

PETROL DRIVEN TRAINS

So successful have been the experiments with four petrol motor driven trains on the suburban service that the Chicago Great Western Railroad is preparing to expand this branch of its equipment to fifteen such trains, which will be used mainly in the thickly populated districts of Iowa. The trains consist of a specially constructed motor car, equipped with a high-power petrol engine and a trailer which resembles an ordinary inter-urban electric coach, although more heavily built. The motor car has room for freight and baggage at the back of the compartment occupied by the engineer. The four trains now in use in Iowa are making runs of from 100 to 150 miles a day.

BELT SPEED

Belt speed is determined by the rim velocity of either the driving or the driven pulley. It is equal to the diameter of the pulley times 3.1416 times the revolutions per minute of the pulley. If the pulley diameter is given in inches, divide the answer by twelve to get the speed in ft. per min. Example: 14 in. dia. pulley running 600 r.p.m.

$$\frac{14 \times 3.1416 \times 600}{12} = 1675 \text{ f. p. m.}$$

Avoid crossed belts on short center distances. Avoid crossing wide belts anywhere. If crossing is necessary, see that the rubbing of the belt surface does not have a tendency to open up the laps.

Use a wide enough pulley so a small amount of belt irregularity does not make it run off. Allow at least ½ inch on machine pulleys, and 1 inch or more on countershaft and lineshaft pulleys. Use crowned pulleys where possible.

If possible, use a horizontal belt with large center distances and the pulling side at the bottom. In a horizontal drive, the slack side of the belt at the top of the drive increases the belt contact.

To obtain a given amount of power, better use a narrow belt running at high speed than a wide belt at low speed.

Where possible, use a belt speed of 3,000 ft. per minute, but no more than 3,600 ft. per minute.

In ordering belting to be put on with clamps it is a safe rule to deduct one-eighth of an inch for every foot of the actual length required, because the clamps will probably stretch the belt slightly.

MILLIONS SAVED ON FUEL

Of interest to shipping interests in particular and to industry in general is the fact that the American Bureau of Shipping announces that fuel conservation tests conducted at the request of Shipping Board, under the supervision of a committee of marine engineering experts, during the last round trip of the United States Lines steamship "America," indicate a possible saving to the board's fleet of more than 3,000,000 dollars a year. Prior to the commencement of the outward voyage certain forms of grate bars and appliances calculated to obtain from the coal used a greater degree of combustion and heat were installed. Particular attention was given to the application of consumption of energy that is generally wasted in the form of smoke. Captain McAllister, of the "America," reports that the test showed the following results:

(1) An average saving of 23 tons of coal a day, based on the record showed by the ship in eight previous voyages.

(2) An average increased speed of .84 knots over that shown by the eight previous voyages.

(3) Proof that the saving in coal for the "America" alone would be 50,000 dollars a year.

Farwell Foundry Co., Kitchener, makers of soil pipe, have made two recent additions to their plant.

Marcus A. Grossman, metallurgist for the Atlas Steel Corporation of Dunkirk, N. Y., will discuss "Alloy Steel" at the November meeting of the Toronto Chapter, American Society for Steel Treating, Friday, Nov. 24, 8.15 p. m., 124 Richmond St., W.

In connection with the irrigation scheme for the extension of cotton growing in the Sudan which will cost £4,000,000 a large amount of heavy equipment is called for. According to a report from London, the contractors have placed an order for 13 large dragline excavators with a Lincoln firm. There was severe competition in this business from American firms. The machines, some of which will weigh over 70 tons, will all be mounted on caterpillar tracks.

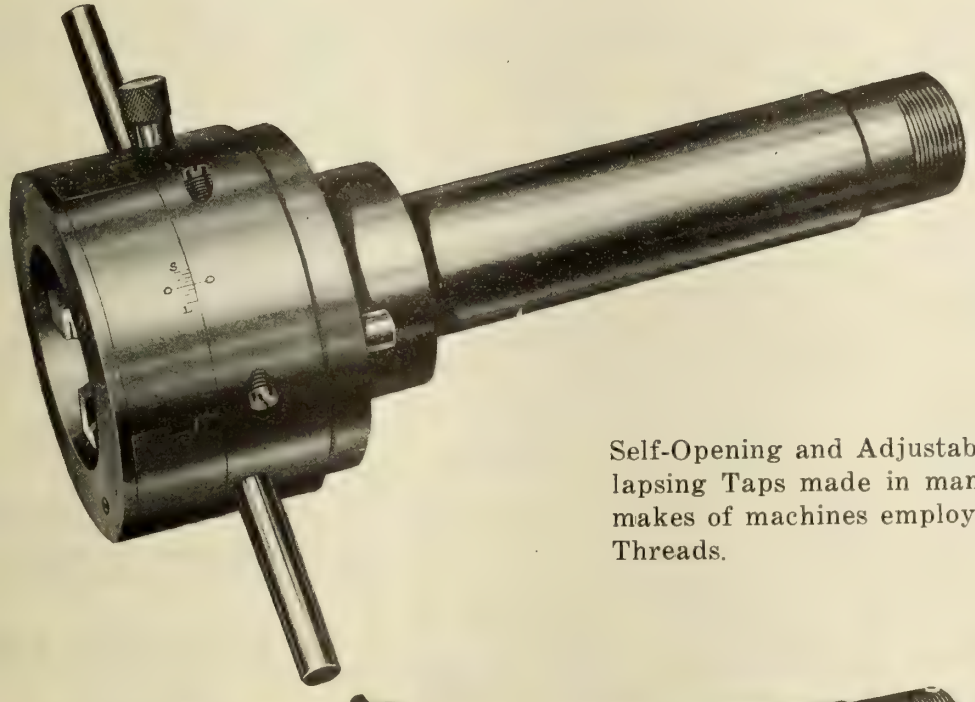
According to reports from Washington, Canada purchased more iron and steel in the United States in September than any other country, the tonnage being 41,417. Japan held second place with 22,328 tons. The shipments to other important markets were: Cuba, 7,656 tons; Mexico, 6,193; Brazil, 6,133; China, 5,689; United Kingdom, 4,306; Chile, 4,229; Argentine, 4,145; Chosen, 3,403; India, 2,909; Australia, 2,403; Colombia, 2 303; Philippine Islands, 2,224; Peru, 1,562; Rumania, 1,463; Venezuela, 1,304; Hongkong, 1,074; British South Africa, 979; and Panama 978 tons.

F. C. Cronin, Detroit, sales manager of the Hoffman Combustion Engineering Co., of that city, has been in Toronto recently making agency connections. Their representatives in Ontario are J. H. Fryer & Co., 186 King St., W., Toronto and Dugold Turner & Co., Clyde Bldg., Hamilton. It is claimed for their product, the Hoffman grate, that it increases fuel efficiency 50 to 70 per cent. as the result of pre-heating and the even distribution of air through the fuel bed by forced draft. It is thus said to be possible to burn efficiently, lower grades of hard and soft coal, costing less per ton.

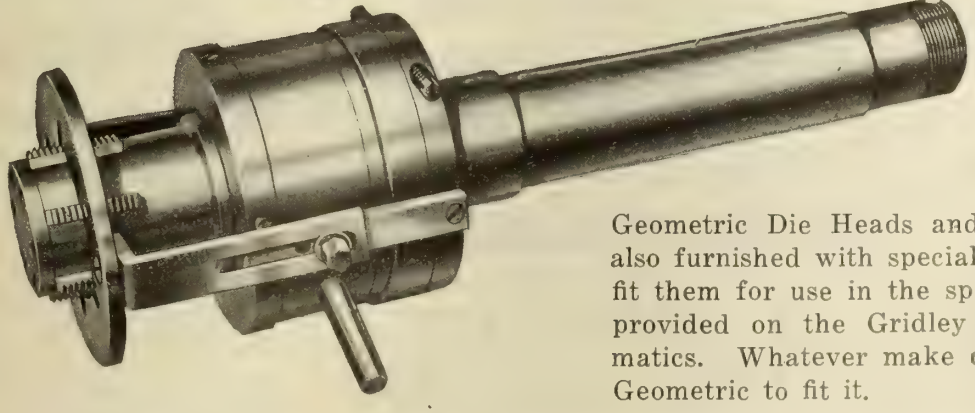
GEOMETRICS

For Cutting Screw Threads

Right on the Lead



Self-Opening and Adjustable Die Heads and Collapsing Taps made in many styles for the many makes of machines employed in producing Screw Threads.



Geometric Die Heads and Collapsing Taps are also furnished with specially threaded shanks to fit them for use in the special threading fixture provided on the Gridley Single Spindle Automatics. Whatever make of machine, there is a Geometric to fit it.

Buying made easy

By grouping together these manufacturers of Special Machinery, Gears, Gauges, Dies, etc., we are making buying easy for you. Here you have a directory of the firms who can fill your requirements on any of these lines. When you are in need of any of the above, consult the firms listed here

CANADIAN MACHINERY

Buyers' Directory

143 University Ave. - - Toronto

Ask Your Bank Manager—

if you would find the Financial Post of real benefit to you

He will tell you that THE FINANCIAL POST is Canada's leading financial and investment newspaper; that it will solve your investment problems, save you from loss and analyze business conditions for you.

He probably reads and enjoys THE POST —2,200 Canadian bank men do—and will tell you how THE POST can help you.
Or if you want to subscribe now to this valuable weekly newspaper of news and views of business and investment send $5 to-day.

THE FINANCIAL POST TORONTO 143 University Ave. - - CANADA

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

BLACK & DECKER BENCH DRILL STAND

BENCH DRILL STAND WITHOUT DRILL

$45.00

BLACK & DECKER SPECIAL HALF INCH DRILL

$106.00

ILLUSTRATION SHOWS BENCH DRILL STAND *with* BLACK & DECKER SPECIAL ½" DRILL

COMPLETE AS SHOWN

$151.00

The bracket supporting the drill may be raised or lowered to suit the height of the work and may be swung entirely around the post, which is a big advantage in locating the hole and for handling large jobs and odd shapes. The bracket is secured in position by means of a hand screw.

YOU can always tell a good mechanic by his tools. He never buys inferior tools because they are cheap, if he can avoid it. But if he is a good business man as well as a good mechanic he guards against unnecessary expenditures.

In most shops a portable electric drill is absolutely indispensable and a drill press often necessary. Good mechanics everywhere are using Black & Decker Portable Electric Drills; and to make it possible for them to have the advantages of a drill press at minimum expense we have produced the Black & Decker Bench Drill Stand.

The Black & Decker Portable Electric Drill can be mounted in this stand in a few seconds and dismounted just as readily. The Stand sells for only a fraction of what it would cost to install a drill press.

The Black & Decker Post Drill Stand is similar in all respects to the Bench Drill Stand except that it has a longer column and is arranged with brackets so that it can be mounted on wall or post and the drilling table is secured on the vertical column with a hand screw so that it can be raised or lowered or swung around.

MADE IN CANADA

A very substantial reduction in prices has been made possible by the establishment of our Canadian factory.

CREDIT

BLACK & DECKER National Credit Service enables any reliable person in Canada to purchase Black & Decker equipment from his jobber on terms that permit the equipment to pay for itself.

This is the new Black & Decker Special Half Inch Drill, which has created such a sensation in the trade by reason of the fact that it combines Black & Decker quality and an exceptionally low price.

The fact that Canadian Industrials insist upon the finest tools and equipment obtainable makes BLACK & DECKER a natural choice.

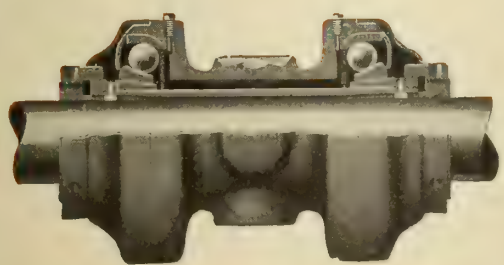
CORMAN ENGINEERING CO., LTD.

—TAKES OVER—

THE CHAPMAN DOUBLE BALL BEARING CO.

THE Corman Engineering Co., Ltd., have taken over the entire business and plant of the Chapman Double Ball Bearing Co., and are now prepared to give a better and more efficient service in every respect.



The only MADE IN CANADA Line Shaft Ball Bearing.—Fits any Standard Hanger.

Their Products:

Standard Lineshaft Bearings
Ball and Socket Pillow Block Bearings
Loose Pulley Bearings
Fan Bearings
Friction Clutch Bearings
Gallows Pulley and Power Table Bearings
Annular and Thrust Bearings
Automobile Bearings
Complete line of Transmission Equipment
Universal Elevating Trucks

IN ADDITION to the Chapman Double Ball Bearing Co. products they offer the following Engineering Service:

Cylinder Grinding
Rubber Moulds
Tools and Dies
CARBONIZING and HARDENING
Patent Models
Punch Press Work
Job Machine and Grinding Work

GUTTA PERCHA & RUBBER, LIMITED
TRADE PMS MARK
THE "RED RIBBON" BELT
TORONTO, CANADA

For Maximum Power Delivery Install "PMS" Belting

Two principal factors enter into maximum power delivery: efficient transmission and continuity. "P M S" excels in both of these. By its greater adhesion to the pulley it gives a high percentage of efficiency. By its great strength it reduces break-downs and adjustments to the minimum.

On this basis, we claim it is the best for your plant—will you test our claims?

Manufactured Exclusively By

Gutta Percha & Rubber, Limited

Head Offices and Factories: Toronto, Canada

Branches in All Leading Canadian Cities

Sold in eighteen different sets, in sizes to cut from ¼ in. to 1 in. thread, and furnished to conform to U.S., S.A.E., and Whitworth thread standards.

PRATT & WHITNEY

Screw Plate Sets

These reasonably-priced sets of standard P & W Taps and Dies consist of our regular product made up in various combinations to meet the requirements of the small shop, garage, service station and general tool-room.

They are unequalled for fast, accurate threading of all metals and will be found invaluable whether used occasionally or for every-day work.

The taps and dies that go into P & W Screw Plate Sets are of a high quality unusual in such general purpose outfits. The taps are all made with the famous "con-eccentric" land—an exclusive Pratt & Whitney feature—that permits their resharpening on the face of the cutting edge without change in size.

Buying Service

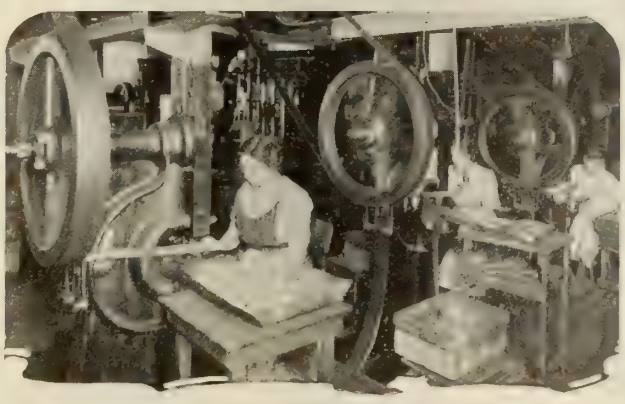

Photo by courtesy of our customer

AN INSTANCE of the long, steady service given by BLISS Presses is afforded by the three "Stiles" type presses illustrated.

Twenty-three years ago they were purchased by their present owner from another firm in the West where they had been in use. All three presses are used continually 9½ hours a day and are still in good working condition. They are shown forming various small mechanical specialties and mechanisms. Eight to ten thousand pieces is their average working production.

Bliss on your machinery is more than a name, it's a guarantee.

New Model "Corona"

High Speed Drilling Machine

A machine of POWER
A machine of RIGIDITY
A machine of CONVENIENCE

THIS TOOL will efficiently drill up to 3 inches out of solid. Note these features of construction:

Enclosed back gears, six positive feeds all operated from front. Balanced sliding head with central guide ways and locking bolts. Large diameter cone pulleys. Renewable ring oil bearings. Graduated steel rack bush lined with gun metal and teeth cut from solid. Balanced spindle by means of roller chain and weight inside column. Fixed worm bracket and improved table elevating mechanism.

For dependable all-round service this new model "Corona" is without a peer. **Send for specification data sheet.**

VOL. NO. XXVIII, No. 22. NOVEMBER 30, 1922

Conditions Create Demand For Labor-Saving Tools

E. F. DuBrul, of National Machine Tool Builders, Predicts Prosperity in 1923—See Labor Shortage—Would Enforce Contracts —October More Favorable Month—Must Look Ahead

Demand:—All signs point to a period of prosperity for 1923. Industrial construction shows some expansions. The outlook for machine tools is better.

Capital:—Rise in commercial rate indicates increasing business. There is a plentiful supply of capital to carry on general business. Because a number of factors may limit the length of the prosperity period, good authorities think it would be well not to anticipate the prosperity stage continuing beyond next fall.

Labor:—Labor shortage is more confirmed and will be one of the limiting factors to the continuance of the prosperity period.

Material:—Iron production has increased 25 per cent. over last month. Indications are that there will be a sufficient supply of iron to meet requirements. Prices of iron show a tendency to decline from the recent high prices, but transportations being bad, supplies should be gotten in for some months.

Fuel and Power:—Coal production is less than the peaks of 1917-18-19 or '20, or the spring of this year—held down probably by car shortage and price restrictions. Electric power demand is higher than ever known before.

Transportation:—Car shortage is apparent. Bad transportation will bring about duplication of orders and consequent cancellations, and undoubtedly help to shut off business.

Equipment:—Labor shortage is creating opportunities for the replacements of present equipment with labor saving machinery and tools.

IN THE above summary of business and industrial conditions, E. F. Du Brul, general manager of the National Machine Tool Builders' Association, Cincinnati, sees every reason for optimism in 1923. Analyzing the growth of demand he states:—

Signs of Prosperity

"In most lines of industry, excess stocks have been worked off, and with orders accumulating, unprofitable prices have disappeared. Many industries that had been working in the red right along are now showing a monthly profit on their operations. This is due not only to increased prices, but to larger volumes at the higher prices. Business men are now beginning to think of plant expansions of various sorts. In some cases there is an indication of pressure on manufacturing capacity, as shown by the F. W. Dodge figures for contracts awarded. In the northeastern states these show a growing volume of industrial contracts in spite of advancing building costs, and this volume must certainly be followed by additional orders for machine tools.

"Col. Leonard Ayres, Vice-President of the Cleveland Trust Co., and a leading industrial statistician, at a recent meeting of the Harvard University Committee on Economic Research, predicted a good period of prosperity in 1923. He pointed out that interest rates, wages, railroad car loadings, automobile output, money in circulation, cost of living, unfilled orders of the Steel Corporation, traffic on the Great Lakes, and rediscounts with the Federal Reserve Banks were all advancing. All these are signs of activity. So, too, are the declines in the price of bonds, the number of failures, the reserve ratio, bank investments, and building construction. He likewise pointed out the statistical probability of an increased number of marriages, a decreased number of divorces, and a decreased number of suicides, as these are regular accompaniments of a period of prosperity.

Advises Against Overstock

"Col. Ayres estimates that the present business expansion will be halted by a shortage of labor complicated by a shortage of railroad transportation, and that these two shortages seem to be already on the way toward becoming serious. Therefore, it is estimated that the present cycle will not be of very long duration.

"This estimate of Col. Ayres has a lesson for the machine tool builder, who is so easily caught with an overstock at the crest of the cycle. In a short cycle, about the time he gets into good full production he finds his orders dropping off. If this cycle works out as seems to be likely, it would be well to watch the order sheets. The machine tool builder must remember that the complications of the machine tool business are such that a lot of thought is going to be necessary.

An Order is a Contract

"The machine tool builder should make it perfectly clear to his customers that **an order is a contract**, and instead of being subject to cancellation, will be enforced at law to the fullest extent. One influential dry goods house in New York has been enforcing its contracts, engaging one of the highest priced firms in New York to prosecute violators of contracts, who had to pay up the damages or go into bankruptcy. Curiously enough, very few went into bankruptcy as a consequence of the enforcement. This is a very good lesson for the machine tool builder. If the same policy is pursued throughout this industry the commercial morality of the customers of this industry will be considerably improved and the machine tool builder will not be left to carry an undeserved burden, as he was in the last slump.

"It is particularly desirable to give due notice of the intention of this industry to enforce contracts in view of the fact that the automobile industry has such a large excess of productive capacity. Many automobile companies are not making money, although they are making a lot of cars. Many of those will in desperation attempt to cut down their production cost by ordering new machinery. But if they do not have the money to pay for the machinery

and to run their business as well, it is not as it should be.

Motor Car Outlook

"We look for more automobile failures and reorganizations, due to the unprofitable state of the automobile industry. A wild scramble for automobile orders is shown by the continued reduction in prices. While one company increases its price, this is only logical if that particular company had such a large participation in total orders in its class, as to demonstrate that the consumer was valuing the product at a higher price than the company itself was asking. Most concerns would increase capacity, rather than price, and so increase the pressure in the industry as a whole to sell more cars. As the market does not now absorb the full capacity of the industry, there will likely be some futher price reductions and additional bankruptcies.

"An evidence of approaching saturation is the congestion in every city in the U. S., where there cannot be very many more cars accommodated in the business sections than are now on the streets. One does not hear this sort of discussion from the automobile trade, but those selling the automobile trade would do well to consider these facts in shaping their business policies and particularly their credit policies.

Machine Tool Demand

"Indexes of contracts awarded for industrial buildings would be a very good index of some future demand for machine tools. Demand for machinery is of two kinds; expansion demand, and replacement demand. A case of the latter kind recently came to our attention. An automobile company bought a machine for $3,000 which replaced two machines that had cost $3,000.00 apiece. One man on the new machine produced as much as four men previously on the old machines. This buyer respected the machine but not the man that sold it. The replacement saves the cost of the new machine in about six months, so it was an investment netting 200 per cent. a year. We have heard of some other instances in which the user was able to secure a 300 per cent.-a-year investment from the machine tool builder.

"Shrewd buyers in that industry do not seem to be able to pick such bargains out of the pockets of sellers of other goods. Selling ability of that kind is very properly rewarded with a loss instead of a gain.

"Our reports of machine tools indicate a more favorable situation during October than during September. A number of percentage reports are climbing up into the higher classes. The zero class has almost disappeared, and the reports in the upper classes are evidence of more unit activity than the curve shows, because the dollar basis of these reports is materially lower than it was in the base period of the first quarter of 1920. Nearly 80 per cent. of the industry are operating at less than 30 per cent. of the dollar volume of the first quarter of 1920. This industry is still in the red ink stage.

"Costs are not likely to be any lower than present levels. By the time the machine tool builder has rebuilt his force of labor to produce the machines he is now contracting to build, the costs will be higher.

Must Look Ahead

"The machine tool builder should look ahead when he takes contracts. He need not be surprised when this winter is over to find himself unable to get labor at the price ruling when he took his contracts. Better salesmanship in this industry can make it possible for the machine tool builder to pay his force as much as they can earn in the shops of his customers. Of course his customers must get a profit from the use of the machine, or they will not buy, but that profit can be something less than 300 per cent. a year, and still be worth while.

Cover Needs in Material

"Prices on steel seem to have a tendency to further advance, while prices on pig iron have a tendency to decline. Recent advances in pig iron prices were due to the bidding customers who had no spot iron and were compelled to resort to the spot market to supply their wants. The spot market was cleaned up because of the car and fuel shortage. The fuel shortage being removed, production has increased 25 per cent. over last month. While the car shortage of labor will eventually work to hold down general production and therefore the demand for pig iron, if prices soften further it would be well to cover one's needs for some months to come. As to steel, the situation seems rather the reverse. The Steel Corporation is getting well booked up and this shows that some further price advances seem probable. Here again labor shortage is likely to restrict production to 70 per cent. of capacity.

Fuel and Power

"Charts of bituminous coal production issued by the U. S. Geological Survey, show that the weekly loadings of coal since September 2nd have been at about a stable point, there being very slight variation from week to week since that time. But this point is considerably below high points reached in 1920 and 1918, also considerably below the fall season loadings of 1918, 1919, and 1920.

"A higher price will certainly bring out more coal than a lower price. Last spring the railroads could and did handle considerably more coal than they are handling to-day. Artificial interference with supply and price in such a sensitive market as coal is merely going to create a scarcity of coal and leave the miners in better shape to enforce greater demands next spring than they have at any other time. The radicals among them choose to make the demands and the radicals dominate that union. The forehanded business man will discount this probability.

Car Shortage Growing

"While the railroads are using every possible effort to reduce the number of bad order cars they are not catching up on industrial activity, and the car shortage is growing. The new car orders being placed are considerably smaller than in a number of previous years. These cars are not being delivered as fast as the railroads can use them, because of labor shortage at the car works, and material shortage due to the car shortage. At the first sign of severe weather the railroads are going to suffer very greatly and that restriction will slow down business. It will also create a lot of duplicating of orders in some lines and a lot of cancellation will follow later. In some industries a hectic winter is likely. Get your material in as soon as you can.

Production Not Pounds

"While general industrial equipment is still plentiful, labor scarcity gives an opportunity to interest buyers in high production types of machine tools. The prices being asked for them ought to be a temptation to the buyers to invest in them, especially if the salesmen sell 'Production, not Pounds'."

CLAIM SMOKE IS VALUABLE

Sheffield, Eng., steel manufacturers claim, not for the first time, a vested interest in smoke. In consequence of the introduction of the Smoke Abatement Bill a report was issued by a joint committee of the Chamber of Commerce, Sheffield and District Engineering Trades Employers' Association, Crucible Steel Makers' Association, Rolling Mill Proprietors' Association, and the Forgers' and Tilters' Association. This report contains the following observations:—

"Sheffield manufacturers practically stand alone in the country in dealing with high-carbon steels, and they claim that such steels cannot be dealt with satisfactorily in smokeless furnaces, either for forging, rolling, or annealing.

"Sheffield manufacturers know of no process for heating steel sheets for high-class finish which avoids a certain amount of black smoke.

"The reason for smoke being necessary under the last two items is that a smoky atmosphere does not decarburise the surface of the steel, whereas a clear flame will do so, and render the material useless for the purpose for which it is required.

"Sheffield manufacturers claim that attempts to use an excess of gas, for instance, in a gas-fired furnace in order to reduce the smoke trouble, have been a failure, and will continue to be a failure with present-day knowledge and with the staff and workmen at their disposal.

"Sheffield manufacturers believe that it is inconceivable that the Government would consent to pass an Act that would have the effect of shutting down the whole of such plant in Sheffield, and they look to them to safeguard their interests."

?? Questions and Answers ??

ENQUIRY FOR GREASE CUPS

Question:—Please advise where we may obtain pressed steel grease cups in Canada. Initial quantity required, 20,000 per annum.—A. B., Buenos Aires, Argentine Republic.

Answer:—Canadian Winkley Co., Windsor, Ont., are producers of grease cups in quantity.

SALES TAX ON USED MACHINERY

Question:—What are the sales tax requirements on second-hand machinery when taken in part payment?—C. H., North Bay, Ont.

Answer:—The Department of Customs and Excise has ruled that where a manufacturer or wholesaler, in selling goods, takes back an old machine in part payment, and makes an allowance for same off the selling price, the sales tax applies on the selling price without any deduction for the allowance. Thus if the selling price of the goods is $1,000 and the purchaser turns in an old machine or, in fact, any goods for which all allowance is made, say for example $200, sales tax applies nevertheless on the selling price of $1,000.

Where a manufacturer sells and delivers from his factory a second-hand machine the Department of Customs and Excise regards him as a wholesaler in respect of such sale and he is required to charge and account to the Government for a sales tax of 2¼ per cent. thereon. For example,—a manufacturer may take into his factory warehouse an old machine as part payment for a new machine, and when selling the second-hand machine, so accepted as part payment, the manufacturer is regarded as a wholesaler and the sale is subject to a tax of 2¼ per cent.

Note:—Where a manufacturer sells equipment discarded from his factory such sale is not regarded as taxable under the Act. This is by reason of the fact that the manufacturer when buying machinery and equipment for his own plant is regarded as a consumer and therefore a sale of such discarded equipment is a sale by a consumer and such sales do not come within the meaning of the Act.

Scrap:—The Department of Customs and Excise has ruled that scrap sold by a concern, which is a consumer thereof when the goods were purchased is not subject to payment of sales tax when sold by such concern.

That is to say—when a manufacturer is selling scrap or waste, being the deteriorated material of his plant equipment, or otherwise, but in respect of which he was rated as a consumer at the time of his purchase, the sale thereof by him in the condition of scrap or waste, is not subject to payment of sales tax.

But scrap produced in the process of manufacture,—such as clippings of brass, copper, etc., when sold to junk dealers, or scrap dealers, is subject to the payment of sales tax on the sale to such scrap dealer, since the manufacturer, producing the material, was not rated as a consumer at the time of his purchase of such material. The tax in such cases will be at the rate of 2¼ per cent.

RECEIVED VALUABLE REPLY

Editor Canadian Machinery.—Many thanks for your letter of 22nd inst. in reply to our enquiry. The information contained therein is of considerable value to us at this time.

The N.—Company

TENSILE STRENGTH OF BELTING

Question:—What is the tensile strength for leather belting as laid down in the specifications prepared by the Bureau of Standards, Department of Commerce at Washington? Are these specifications recognized here?—J. W., Belleville.

Answer.—These specifications were agreed upon in order to establish definite standards of quality, and to promote, particularly among buyers, a more certain knowledge of their requirements. There are no such specifications in force here, but the standards obtain pretty generally in the Canadian belting industry. It is required that all leather shall have a minimum tensile strength of 3,000 lbs. per sq. in. of cross section, and an average tensile strength for single belts of 3,750 lbs. per sq. in., and for double belts of 3,500 lbs. per sq. in. The average shall be determined with five test specimens selected at random from different parts of the sample being examined. Test specimens of the size and shape as shown above shall be cut with a metal die. The edges of the test specimen shall be cut perpendicularly. The minimum thickness inside the gauge marks shall be used in determining the area of the cross section of the test specimen.

Laps and plies.—The laps of both single and double belting shall not open when subjected to a tensile stress of 2,500 lbs. per sq. in. The opening of the laps shall be determined by testing two specimens cut across the point of the lap lengthwise of the sample. For double belting the test shall be made on the single ply.

The average elongation at a tensile stress of 2,500 lbs. per sq. in. shall not exceed 15 per cent. The average shall be determined with the same five test specimens used for determining the tensile strength.

To determine the amount of elongation, parallel gauge marks 2 in. apart shall be placed upon the restricted portion of the test specimens. The distance between the gauge marks shall be measured with a pair of spring dividers, at a tensile stress of 2,500 lbs. per sq. in. The amount of stretch shall then be determined by measuring the opening of the dividers on a scale.

This test will be made on each lot of two thousand feet, or fraction thereof.

The following stretch test shall be made on the finished belting up to, and including, six inches in width. Any section of a roll or belt shall be selected (which shall not be cut out) on which gauge marks shall be placed 10 ft. apart. Suitable clamps shall be attached on the marks so that the distance between the clamps shall be 10 ft. The section shall then be suspended in a vertical position from one of the clamps. Sufficient weight, including the weight of the clamp, shall be attached to the lower clamp to produce a tensile stress of 750 lbs. per sq. in. of the average cross section being tested. The section after being subjected to this tension for 15 minutes shall show a length between gauge marks not to exceed 10 ft. 7.2 in. (6 per cent. stretch).

Measure of Elasticity.—The clamps shall then be removed, and the section allowed to lie loosely on the floor for 17 hours, after which time the length between the gauge marks shall not exceed 10 ft. 1.6 inches (1-1/3 per cent. stretch).

Increasing demand for quarrying and stone cutting and handling equipment will result from the growing market in Eastern Canada, as the product of Manitoba's granite producing industries will bring about rapid development of these important industries. Both red and grey granite have been taken out during operation of the quarries within the last two years and it is expected the industry will develop rapidly since a market has been found in the East.

Sir Henry Thornton's Chances of Success on C.N.R.

Will Have to Overcome Exceptional Difficulties—Unanimous Support Required—Must Have Efficient Work From Employees —Rates Too Low in Proportion to Expense—Must Have Freedom

WHEN Sir Henry Thornton undertakes the work of putting the Canadian Government Railways on their feet, physically and financially, he will, simply because they are government railways, have to overcome difficulties such as the men who built up the great railway systems of the United States never encountered, writes Samuel O. Dunn, editor of Railway Age, discussing "Thornton's Chances of Success," in MacLean's Magazine.

"Sir Henry Thornton cannot tear up unprofitable lines without depriving some communities of railway service. Will they not bring political pressure to bear to prevent this? He cannot increase the average freight train load without reducing the speed and frequency of the freight service rendered to many communities.

"The writer was told on good authority some months ago that the Canadian Government Railways were taking live stock traffic away from the western lines of the Canadian Pacific because they were running live stock trains with smaller loads and on faster schedules than the management of the Canadian Pacific regarded as warranted on sound operating principles. Whether this was the case or not, it is undeniable that railways operated by the Canadian government have in the past furnished service the earnings from which did not anywhere near cover the expenses, because an unwise or wholly selfish local public sentiment demanded it.

"Will public sentiment support or resist Sir Henry Thornton if he attempts to make changes in service which are essential to economical operation? Undoubtedly the attitude assumed by the public will determine the attitude assumed by its representatives in parliament.

Unanimous Support Required

"Sir Henry may be favored in the early part of his work by an increase in traffic due to improving business which will cause the railways to need all the men they have and render it unnecessary in the interest of economy to reduce the number of employees. But there will be pressure brought to bear under these conditions to cause an unnecessary increase in the employees. Besides, every business, whether owned by a government or private company, has its periods of depression when good management requires a reduction in employees. There will be resistance to such reductions on the government railways when they are needed. The time will come when economic conditions will demand further reductions of the wages of the employees.

"Will Sir Henry Thornton be able to get the labor member of the board of directors to support him in his efforts to

SIR HENRY WORTH THORNTON

secure the most efficient work from employees and to avoid in periods of both good and bad business carrying any more of them on the payroll than are needed? Will he be able to get the support of the labor member for needed reductions of wages? If he cannot do so, will he be able to get the support of public opinion and the public men at Ottawa?

"While railway rates in both the United States and Canada are higher than they were before the war, it is easily demonstrable that they are too low in proportion to the expenses of most railways. This is conspicuously true of the government railways of Canada. If their rates and operating expenses bore a reasonable relationship to each other they would not be incurring the large deficits they are. Nevertheless, in both the United States and Canada there is a strong demand, especially from the western farmers, for reductions of freight rates. Railway rates in Canada are regulated by a board of railway commissioners. If Sir Henry Thornton opposes reductions of rates which he knows will result in large deficits continuing to be incurred indefinitely, will he be able to get the support from public sentiment necessary to make his opposition successful?

"It is easy to anticipate the argument that will be made in favor of reductions of rates. It will be said that high rates are imposing an undue burden upon producers and shippers, and preventing the development of the country. The argument that low railway rates are needed to develop business is always made in every country under either private or government ownership. In only one country in the world where government ownership has prevailed has the demand for low rates been so successfully resisted that the incurring of large deficits on state railways has been avoided. This was in Prussia before the Great War. The state railways of that country for years earned more than the interest on the investment in them; and they are the only system of government-owned and operated railroads which ever did this for a long period. Undoubtedly this was due to the fact that it was impossible to put effective political pressure upon the autocratic government of Prussia.

"Since the war Prussia has become a democratic country; and since the war her railways, like those of other democratic countries, have been incurring huge deficits. Is it not singular there are so many people, even including many business men, who cannot see, or refuse to see, that if railway rates are not made high enough to cover operating expenses and interest on the entire investment in a government system of railroads a deficit must be incurred which must be paid from taxes, and that a given amount collected in taxes imposes just as heavy a burden upon and tends just as strongly to hinder the development of the industry and commerce of a country as the same amount collected in railway rates.

"Furthermore, when the entire cost of furnishing railway service is covered by the rates, those who receive the service pay for it; while when the rates are not made high enough to cover the entire cost of the service, those who get the service pay only part of its cost, the rest being paid by the taxpayer. It is plainly inequitable to give railway service to some persons for less than the cost of furnishing it, and then force others who do not receive it to make up the difference in taxes. Furthermore, when the business principle of making railway rates and earnings cover all expenses and fixed charges is departed from, the door is left wide open for every kind of inefficiency and extravagance, the burden of which falls upon the taxpayer.

He Must Be Given Freedom

"Everyone who has looked into the facts knows what influences have prevailed in the management of the government-owned railways of Canada in the past.

"The government railways have had some very able men among their officers. When, however, one compares data regarding the operating results obtained

Publicity the Remedy

FULL, FAIR and earnest publicity is the remedy that would be applied by Judge Gary, chairman of the United States Steel Corporation, to the "severe and unreasonable competition which has resulted in the steel business now being conducted at a loss."

The head of the Steel Corporation was being questioned in defense of the legality of the Pittsburgh basing practice. This, he points out, had been in force for years and was a method of quotation making for uniformity in marketing. It was explained that it meant a price agreed upon at Pittsburgh, plus the cost of shipment to the selling point.

Such a rule does not and cannot affect the law of supply and demand. The best evidence of this is that, during a buyers' market, the steel industry is as helpless as any other not half so well organized. Ruthless competition gives the buyer an opportunity which comes high to the manufacturer. Such problems create instability and expensive irregularity. It is absurd to suppose that in the light of what is taking place in the steel industry to-day, prices can be controlled or influenced in any way by means of secret agreement. It is not possible to harness world commodities in that manner.

There is probably no fundamental field of activity that is so persistently in the limelight as that which has to do with steel and iron production. All interests demand news of steel. Proper adjustments are regulated through publicity. Arbitrary rules, being impossible, are hastily eliminated.

Statistics are like prophets; it depends on where they come from. Business men seldom recognize the fact that much of the information forecasting Canadian conditions from another country, is based on information easily available to them at home.

Laxity in Contracts

IS AN order a contract? When a name appears "on the dotted line," is it to be regarded as merely a compliance with custom, or does it involve a two-sided responsibility as between seller and buyer?

There are those in the machine tool business, and, in fact, almost every business, who claim that, of recent years, there has been an unwarranted laxity on the part of customers. In fact, abuses have been such that some firms have taken the stand that an order is a contract and that contracts cannot be violated. The aggravation is keenest where money has been spent or obligated on the work before cancellation notice is given. In many such unreasonable cases the customer seems to consider himself entitled to exemption from responsibility. The manufacturer may consider it wise not to insist upon his rights and in some cases stands the loss. This is not good business. It injures the moral standards of the industry

E. F. DuBrul, president of the National Machine Tool Builders' Association, in emphasizing the importance of a close scrutiny of order sheets at the present time, has this to say:

"The machine tool builder should make it perfectly clear to his customers that an order is a contract, and instead of being subject to cancellation, will be enforced at law to the fullest extent. One influential dry goods house in New York has been enforcing its contracts, engaging one of the highest priced firms in New York to prosecute violators of contracts, who had to pay up the damages or go into bankruptcy. Curiously enough very few went into bankruptcy as a consequence of the enforcement. This is a very good lesson for the machine tool builder. If the same policy is pursued throughout this industry the commercial morality of the customers of this industry will be considerably improved and the machine tool builder will not be left to carry an undeserved burden, as he was in the last slump."

Pig iron production in Canada increased almost 50 per cent. in October over the month preceding. The output is still at lowest levels in five years, but there never was a graph that didn't show an upward swing, and this has now set in.

Not Placing For Future

THAT BUYING is being done very largely at the present time on a hand-to-mouth basis, and that there has been very little placing to cover winter requirements, is the report from quarters in close touch with the general situation. The foundry business is said to be the most notable example.

In the expectation of a drastic slump in prices there has been a very light market for pig iron. The same tendency is noticed in the United States and though price adjustments have been made in an attempt to develop demand, it is shown that results have not been as anticipated. Now it is evident that foundries have, to a certain extent, overstayed the market and are in distress because of transportation difficulties. It is thus that any advantage the buyer has had in the situation may soon merge into a more relative concern over the prospect of supply.

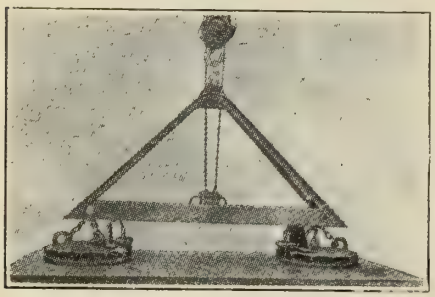
Pig iron production in Canada is hovering around the lowest levels in years. Furnaces have had no warrant for higher production while the market has been in a backward mood. Coal and rail strikes restricted output during the summer and conditions have not been such as to enable operation on a minimum cost basis. It is asserted that these factors discourage any prospect of lower prices. The present seems the time to consider the urgency of future requirements.

New Things in Shop Equipment

NOVEL LIFTING MAGNET

An interesting application of the use of electric lifting magnets is furnished by an order which has just been completed by the Witton Kramer Electric Tool and Hoist Company, Limited, Birmingham.

The illustration shows one of four similar equipments which are being shipped to Bombay for use in unloading steel plates. For a large pipe line which is being erected in Bombay, about 80,000 tons of steel plates will be used. The plates are being shipped to India flat, and will be rolled into shape on site.



Magnet hoist used in unloading steel plates.

The duty of the magnet is to pick up four plates, 19 ft. by 7 ft. 4 in. by ⅜ in. thick, or five plates, 15 ft. by 7 ft. 4 in. by ⅜ in. thick, either one at a time or in the complete bundle. They will then deliver the plates either into stock or into the bending machines one at a time.

In order to accomplish this, the magnets are arranged with special controllers, so that by varying the amount of current supplied to the magnet, it is possible to pick up one plate at a time. For example, starting with one plate, it is possible to go to another pile and pick up a second, move on to a third pile and pick up a third plate, and so on, and to drop them off one at a time alongside each of the four machines.

TAPER THREADING DIE

A new design of self-opening die, especially designed for cutting threads of any commercial taper, has recently been developed. The range of the taper obtainable is from zero up to 2 in. per foot. When working at maximum taper the die will cut a length of 1¾ in. of thread; this length is increased as the minimum taper is reached. This die may be used in conjunction with a second one cutting a parallel portion of the same bolt. These dies are supplied with the shank rough-turned so that they may be accurately fitted in the bore where they are to be used, so as to assure perfect alignment when in service. The bushing in which the operating pinion has its bearing is eccentric, so that the bushing may be partially rotated to compensate for any slight error in alignment of the machine. These tools are made in two sizes, one for cutting threads 1¼ in. dia. at large end, and the other for threads having a dia. of 2 in. at the large end. These dies are manufactured by the Jones and Lamson Machine Co., Springfield, Ohio.

SHAVING MACHINE FOR BOLTS AND CAPSCREWS

A new design of bolt head shaving machine has been placed on the market recently. The machine is driven from the line shaft, a countershaft being placed under the pan of the machine. Any number of machines may be placed together and operated from this countershaft. Separate carriers are provided for the cutting tools, one being used for facing the shoulder under the head while the other rounds the top, both tools cutting simultaneously. A feature of the design is the method of feeding the tools; as they advance to the cut they are drawn slightly towards each other, so that on the return movement the cutters are clear of the work and no dragging or marking takes place. Carriers are independently adjusted. As the screw drops from the feed race it is gripped by the shank and held firmly, leaving ample room for the shouldering tools to operate. The hopper on this machine is stationary and is supported by a hollow bracket, the upper end of which forms a bearing for the revolving shaft. To the upper end of the shaft is secured a four-armed spider, or agitator, which keeps the contents of the hopper constantly stirred up, causing the screws to be located in the annular groove in readiness for feeding to the machine. The action of the agitator causes the bolts to be pushed towards the outer edge of the hopper from where they enter the annular groove, the shank falling down by gravity and the screw being supported by the shoulder of the head. There is no danger of jamming. The rate of feed may be regulated to suit the speed of operation. The number of bolts in the hopper is immaterial as the bolts are gradually and evenly distributed up to the very last bolt. After the bolts enter the annular groove the feed is entirely by gravity. These machines are made to handle bolts and cap-screws up to ½ in. dia. and 4 in. long. They are manufactured by the Asa S. Cook Co., Hartford, Conn.

COMBINATION HAND VISE

A handy little general utility combination hand vise has just been placed on the market. The use of a ball end handle for tightening the jaws, instead of a wing nut, is particularly worthy of note. By this means far more leverage is possible and thus a common difficulty in hand vises is eliminated. The hand vise is furnished with a clamp permitting its use as a small bench vise on benches or shelves having an approximate thickness of ½ in. to 2⅛ in. As shown in the illustration, the change is effected simply by removing the handle and substituting the clamp. When used

Combination hand vise.

with the clamp the vise can be adjusted to any point in a complete circle to meet the convenience of the user. The clamp is made purposely large and strong so that it will withstand hard use. The jaws of this vise are tempered and polished drop forgings, 1½ in. in width. The capacity of the vise is about 1½ in. These tools are made by the L. S. Starrett Co., Athol, Mass.

WHEEL-TRUING DEVICE

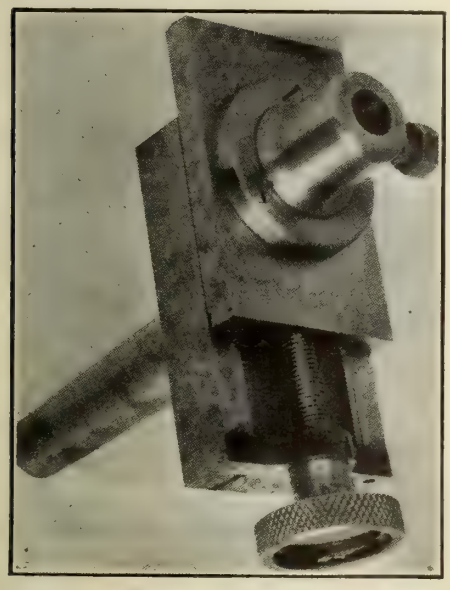
An angular truing device, especially intended for service in shops salvaging worn-out milling machine cutters, reamers and drills, as well as those making a specialty of stellite cutters and tools. The wheel can be quickly and readily formed to correspond to any desired contour. The cutting diamond is fed to the wheel by means of a knob at the top of the device, while cross feed is obtained by a crank that operates the tool holder, located in a slide. The device may be swiveled to any desired angle and accurately set by means of a graduated dial. The arrangement of the device is such that the set-up of the work need not be disturbed to dress the wheel. These devices are made by Wilmarth and Morman Co., Grand Rapids, Mich.

ADJUSTABLE END WRENCH

An instantaneously adjustable wrench has been placed on the market recently. All parts of the wrench are drop forged and treated to a carbonizing hardening process. The tool is light in weight but strongly made, and designed to work in cramped places. The handle is integral with the lower jaw which is notched on the inner side to engage with corresponding notches in the movable jaw, the latter being adjustable when the notches are disengaged. This is accomplished by simply pressing the thumb on a corrugated part of the movable jaw. Turning may be done in either direction. The tool is made in three sizes, 6, 9 and 12 in. in length, the large one weighing 20 oz. They are made by the Gellman Wrench Corp., Chicago, Ill.

PRECISION BORING HEAD

The Bruce Precision eccentric boring head illustrated here is designed for application to drill presses and milling machines for boring jigs and fixtures and also for index boring. It is graduated



Precision Boring Head.

in .001 in. and is provided with a gib to take up wear. It is furnished with adaptors which are so designed they will take various sizes of drills within the capacity of the tool, which permits drilling and boring. The head is made in four sizes as follows: No. 1, ⅜ in. to 1½ in.; No. 2, ½ in. to 2½ in.; No. 3, ¾ in. to 4 in.; No. 4, 1 in. to 6 in. This tool is furnished with a set of six boring tools, chuck and test indicator. It is being placed on the market by the Precision and Thread Grinder Mfg. Co., Philadelphia, Pa.

VERTICAL LIFT AIR HOISTS

Canadian Ingersoll-Rand Company, Montreal, have issued an informative booklet on their "Circo" direct vertical lift air hoists designed to meet requirements in rapid and economical handling of raw materials. These hoists are built in single-acting, double-acting and air-balanced types. The hoists are adapted to use in foundries, pulp mills, chemical plants or other places where dust, moisture, corrosive gases or chemical fumes are prevalent, as no air is drawn from the atmosphere in either the single-acting, double-acting or air-balancing types. Valves are of the poppet type, consisting of either two, three or four cylinders cast in one piece, and with hard brass valve seats. The valves are faced with soft rubber discs, making a tight joint, and may be renewed in a few minutes by unscrewing the caps at the bottom of each cylinder.

SIR HENRY THORNTON

(Continued from page 16)

on the Canadian Pacific with corresponding data regarding the operating results which have been obtained on the Intercolonial, and on the other railways which have been under government management a much shorter time than the Intercolonial, he can reach only one conclusion. This is that the government railways have not been managed with an efficiency and economy which approach the efficiency and economy attained on the Canadian Pacific.

"The difference in the results secured doubtless has been partly due to differences in official personnel. But undoubtedly it has been more largely due to the fact that the officials of the Canadian Pacific have had a free hand to manage that railway on business principles, while the officials of the government railways always have been subject, directly or indirectly, to political influences which have irresistibly compelled them, in many important matters, to subordinate business considerations to political considerations.

"In many countries where railways have been operated by governments attempts have been made completely to free the managements of the railways from political influences. Such attempts have been made in every one of the Australian states. Never, however, in any really democratic country has such an attempt been successful.

"The most important question that remains to be settled regarding Sir Henry Thornton's work as chairman of the Canadian government railways is whether he will, or even can, be given freedom and authority to manage them in practically the same way that he would manage them if they were owned by a private company and he were its president. If he is given this measure of freedom of action and authority he may succeed in time in accomplishing some such improvement in their physical condition, operating efficiency and financial results as was achieved in past years by Harriman, Ripley and Hill on the Union Pacific, the Atchison, Topeka & Santa Fe, the Northern Pacific and other western railways in the United States.

"If he does succeed in doing this he will confer benefits upon the people of Canada which the imagination cannot now even estimate. On the other hand, if a short-sighted and mistaken public sentiment causes political influences to interfere with what he tries to do to effect economies, maintain rates and carry out other policies essential to establishing a business-like relationship between the expenses and the earnings of the government railways, his work will not be successful; and the responsibility for its failure, as well as the losses which will have to be paid because of his failure, will fall upon the people of Canada.

"Sir Henry Worth Thornton is fifty-one years old. He received an engineering education at the University of Pennsylvania and entered railway service as a draftsman on the Pennsylvania Lines west of Pittsburg when twenty-three years old. The Pennsylvania has had a unique method of developing and training officers. On most of the railways of North America most of the officers have 'risen from the ranks.' They have come up from telegraph operators, clerks, brakemen, firemen and so on. The Pennsylvania alone has for many years followed systematically the policy of taking college-educated men, usually engineers, into its organization, and after advancing them step by step through its engineering department, transferring them to 'operating' positions. To make the meaning of this statement clear it should be said that the engineering department of a railway designs, constructs and maintains tracks, tunnels, shops, locomotives, cars and other physical properties. The 'operating' department has direct charge of the making up, breaking up and movement of trains. Almost every high operating officer of the Pennsylvania has graduated from the engineering into the operating department.

"Sir Henry Thornton worked his way up through the engineering department and was made superintendent of a division in 1901. He was superintendent of different divisions for ten years. Now, being superintendent on the Pennsylvania System means something. This railway has one of the densest businesses in the world. A large part of its mileage has double track and much of it four tracks. Under the Pennsylvania's organization the superintendent has duties and responsibilities comparable to those of the general manager of many large single track railways. When therefore, it is stated that Thornton was ten years superintendent on the Pennsylvania it means that he had a long and valuable experience and training as an operating officer. He was next made assistant general superintendent and then general superintendent of the Long Island Railroad. This is a subsidiary of the Pennsylvania which handles a large suburban business on Long Island into and out of New York City.

Practical Ideas From Practical Men

HANDY RADIATION CHART

By W. F. Schaphorst

The Stefan-Boltzmann radiation law is acknowledged to be as good as or better than any. The trouble is, however, most people who have to figure radiation do not like to use it because temperatures in it are given in deg. F. absolute raised to the fourth power which takes considerable time to compute. I have, therefore, prepared the accompanying chart which takes care of the absolute temperature feature and also takes care of raising to the fourth power and dividing by one hundred. The law is given by Stefan-Boltzmann as follows:

$$H = CA\ t\ \frac{(T)^4}{(100)}$$

Where H=heat radiated in b.t.u.
C=a constant
for smooth glass=0.154
for dull brass=0.0362
for lampblack=0.154
for slightly polished copper=0.0278
for dull oxidized wrought iron=0.154
for clean bright wrought iron=0.0562
for highly polished wrought iron =0.0467
for rough cast iron, highly oxidized =0.157
for water=0.112
for ice=0.106
A=area of radiating surface—sq. ft.
t.=time in hours
T=temperature in deg. F. absolute.

It is not very well known but it is a fact that this formula can be applied very nicely to problems where it is desired to determine the radiation due to increase or decrease in temperature. Using the chart the computation is accomplished as follows:

Find the temperature in deg. F. in Column A and in Column B the corresponding figure is the absolute temperature divided by 100 and raised to the fourth power all worked out. For example:—What is the radiation in 10 hours from a rough cast iron surface whose area is 10 sq. ft., the temperature of the cast iron being 40 deg. Fahrenheit?

Referring to the chart, find 40 degrees F. in Column A. Opposite in Column B is the figure 625. For cast iron the table gives us the constant 0.157. We, therefore, find the radiation to be—

0.157 x 10 x 10 x 625=9820 b.t.u.

If this is the normal temperature of a room and if the cast iron object is a radiator and it is desired to maintain the temperature of the radiator at 250 deg. F. how much heat is radiated in 10 hours?

Our formula now becomes—

$H = CA\ t\ (T_1 - T_2)$ where

T_1=the higher value given in Column B of chart;

T_2=the lower value given in Column B of chart.

Find 250 deg. F. in Column A. Opposite that figure in Column B is the figure 2550. Substituting in our formula we now have—

0.157 x 10 x 10 (2550—625)=30250 b.t.u.

Inversely, if the normal temperature of the room is 40 deg. F., and if the cast iron object is to be used as a "cooler" instead of as a heater and if brine is to be circulated in the cooler maintaining it at a temperature of 30 deg. F., how much heat will be absorbed by the cooler, or, "radiated into it" in 10 hours?

Opposite 30 deg. F. in the chart we find in Column B the figure 575. Substituting this in our formula we find that—

0.157 x 10 x 10 (625—575)=785 b.t.u.

This chart is made to include most of the temperatures dealt with in average practice. Where temperatures are extreme the original formula can be used which is as follows where there is a change in temperature.

$$H = CA\ t\ \frac{(T_1)^4 - (T_2)^4}{(100)\quad(100)}$$

Where all factors are as given above with the exception that—

T_1=higher temperature, absolute, in degrees Fahrenheit.

T_2=lower temperature, absolute, in degrees Fahrenheit.

To find the absolute temperature in deg. F., add 460 to the temperature as given on the thermometer. Thus, 40 deg. F. as given on the thermometer is equal to 500 deg. F. absolute.

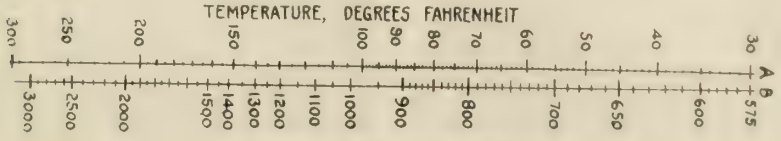


Chart for finding heat radiation.

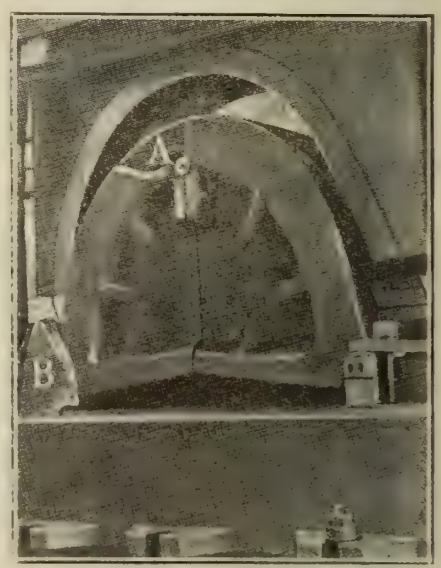
Canadian Wire Weaving Co., Niagara Falls, Ont., makers of wire cloth used in paper-making processes, may shortly consider an extension of their plant. Since their incorporation three years ago their growth has reflected that of the pulp and paper industry.

Danger Unforeseen Result—Man Killed

A fatal accident occurred recently in connection with a large drawing press used for stamping out automobile fenders, states the Travelers' Standard. A portion of the upper part of the die, weighing about ten pounds, broke off when the ram came down upon it, and was thrown out with considerable force.



Breaking of this die cost one life.

A helper who was removing the stamped fenders at the back of the machine was struck in the face by the flying piece, and died within about ten minutes. The accompanying engraving shows the ram and die of the press—the proportion of the die that broke off being indicated by the letter "B" and its original position by the letter "A." The likelihood of an accident here described had not been considered and no provision had been made to prevent such an occurrence to guard the workman against its consequences. In the future, however, protection against the recurrence of a similar accident will be provided, in this plant, by attaching a steel plate flange to the press in such a way that if the pieces of the die break off they will be prevented from flying out, thus preventing injury.

Bethlehem Steel Co. are having two motor-driven ore carriers, each of 20,000 tons and measuring 560 feet in length and 72 feet in width, built in German shipyards. The boats will ply between Chile and United States.

Steel Men Anticipating Fair Sized Railway Orders

Speculation as to Sir Henry Thornton's Policy—November's Record One of Steady Demand—Plate and Structural Orders Being Cleaned Up—Light Market for Pig Iron

PRODUCTION of steel ingots according to advices from Pittsburgh, is on a basis of 75 to 80 per cent., the highest rate since October, 1920. One fact that emerges from the present situation is that since Oct. 1 steel production has been at a rate 15 per cent. above the average rate in the six months preceding. Stocks were decidedly low at the beginning of that period. Consumption could not have exceeded production, and it is evident, therefore, that it must be at least 15 per cent. heavier. This is a great point to consider in connection with industrial reviews suggesting that business is getting better and will continue to do so. There is some opinion that the inflationary period has not been entirely dissolved.

November's record in Canadian markets has been one of steady demand, although orders have not been remarkable for size. Slight improvement in shipments is reported and some of the outstanding orders on plate and structural steel are being cleaned up. Railroads are buying materials for car repairs, and just what Sir Henry Thornton's arrival will mean to the Canadian steel industry is at present a topic of interest among those who are inclined to be speculative. His approval, it is understood, is all that is necessary in order to set in motion rolling stock orders that have been hanging fire. To bring the national railroads up to highest standards of efficiency, it is evident that a very considerable sum of money will be spent, and Sir Henry is the man supposed to have the first and last word to say in the loosening-up process.

It had been expected that some readjustment of sheet and tin plates would be announced by the Steel Corporation for the first quarter of 1923, but no advance has been made. It is evident that old prices will stand in spite of the feeling that, as plate did not advance since March, new prices were imminent. On the other hand, it is claimed that $4.75 for 100-pound coke tin plate was rather a high one for conditions existing at the time and since. There has been no change in sheet prices, although the Canadian market is firmer. Bars, shapes and plates also show stability while the demand for pipe is very strong, with slow delivery of skelp supplies contributing to production problems.

Pig iron is moving slowly in a very conservative market. Foundries engaged on radiators or other building supplies, have had a good season. Pittsburgh reports that coal declined 75 cents a ton last week, and to show the lack of coherence in the market, coke, a coal product, advanced 50 cents and pig iron, which is made with coke, declined $1. Pittsburgh quotes steam coal $2.50 to $2.75; coke, $7.25 to $7.50; pig iron, Bessemer, $30; basic, $27; foundry $27.50.

Toronto

November 29.

WHAT Sir Henry Thornton will do in the matter of buying for railway requirements when he assumes control of the C. N. R., is a topic that is being discussed with considerable interest in Toronto markets at the present time. It is felt that large orders will be placed for rolling stock equipment and that several other important equipment items will be the subject of final decision. It is certain that the market has felt the absence of the railroad as a strong buying factor. Demand from this quarter has been the great incentive to the activity in the United States, and it is felt here that the time cannot be far distant when Canadian roads must show a similar movement. November has closed with a fair record. Orders have not been large, but the showing on the whole has been encouraging.

Iron and Steel.—Pittsburgh has not yet made announcement as to any marked changes that may apply in the first quarter, 1923. It was expected that the American Sheet and Tin Plate Company would make a move that would be of interest, but it is now declared that present quotations would stand. According to dealers, there appears to be no outstanding reason for price changing at the present time, in view of the somewhat conservative attitude of the market. Buyers still seem to be in control to a very definite extent, although difficult conditions surrounding production and delivery will tend to loosen absolute attitude. Dealers report a good demand for interior building materials, such as metal lath. Blue annealed sheets are also strong. Railroads have been buying considerable quantities of repair material. The sheet situation has stiffened. There is a steady market and, on the whole, business is good.

Steel imports are moving better, and contracts on plate and structural are being cleaned up gradually. The arrival of snow will not help the shipping situation. In fact those manufacturers who have been working on a hand-to-mouth basis owing to curtailed supplies, will now find their troubles multiplying. Current prices:—

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 75
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		3 95
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 25

Old Materials.—Markets both in Canada and United States are reported to be without feature. Furnace demand has slackened, and the opinion that there must soon be an adjustment of prices to meet the pig iron situation seems to be gaining ground. No. 1 machine cast iron is quoted at $18, and supplies available are somewhat short. A report from Pittsburgh makes this significant statement:—"The entire structure of the scrap iron and steel market is shaken by weakness. There has been a general decline in dealers' buying prices ranging from 50c to $1 per ton. Hardly a grade of scrap dealt in has escaped the decline. The market, of course, is a dealers' market entirely and the weakness is the result of forced sales, some dealers being anxious to sell material in view of the weakness in other co-related iron and steel products. Sales have been on a small scale, but they have been sufficient to cause dealers to endeavor to sell every prospect. Mills are not buying. The weakness in pig iron and the difficulty in disposing of finished steel products has caused mills which would otherwise be in the scrap market to hold off, in the expectation of a decline in prices." Dealers' prices on the Toronto market:—

Copper, light	9 00
Copper, crucible	11 25
Copper, heavy	11 00
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton.	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Non-ferrous Metals.—Notable features in this market centre in the tin situation. London reports heavy slump in prices and this has had a tendency to depress the market. Prices have eased. American buying is said to be negligible. Sales of copper are said to represent a fair volume. Competition among American sellers is said to have caused a slight shading of prices. Canadian quotations remain unchanged. Buying is being done on a very conservative basis,

although the month's volume is considerable. Current prices:—

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

Pig Iron.—There is no forward buying to speak of. Small quantities only are moving, and it is said that this feature reflects the condition of business in many quarters although there are evidences that, taken as a whole, the demand for castings is fair. Radiator plants and those having to do with plumbing and heating operations, have had a good season.

Manufacturers of copper and brass products report that supplies are coming through in sufficient quantities to keep plants running. The demand is fairly brisk. It is hinted that any change in prices will tend upwards. Some houses are featuring fancy gift lines for Christmas trade for the first time and report encouraging sales.

Montreal

November 29.

THAT it is difficult to say very much of definite significance about Canadian steel markets, as there is so little of interest to mention, seems to indicate the general tenor of opinion here. "The economic conditions of the country," said a prominent dealer, "do not seem to be conducive to important undertakings being promoted and the most important customers which the Canadian Steel Mills and allied interests have always been depending upon as a basis of their business have almost entirely been missing this year—that is the Canadian Railways. Their buying has been extremely restricted and it is an accepted fact that if the railway interests of our country do not carry on normal buying for new equipment and repairs, conditions in the Canadian steel trade are not reckoned as being normal. There is no indication of the railways altering their policy of retrenchment, but a large section of the trade are hopeful that when the co-ordination of the government railways takes place after the new management gets into working shape, that this institution will anyway enter the market for a considerable amount of new equipment."

The current demand for general steel commodities continues fairly quiet and prices have not changed in any respect from what have been quoted during the last two weeks. Supplies in warehouses, such as plates, sheets, bars, boiler tubes shafting, etc., are none too large and if the demand was heavy there would be a complete shortage in many lines with consequent advances in prices. Delays at sources of supply are responsible for the reduced stocks and it would not be surprising if, in the course of a week or two, local warehouse prices were advanced anywhere from $2.00 to $3.00 per ton.

Iron and Steel.—The demand for these commodities continues quiet without any change in prices. Manufacturers of sheet metal and tinware products are understood to be fairly busy and are well supplied with sufficient raw materials to carry them over the next several months. Montreal firms have been importing heavily of late and plentiful supplies appear to be on hand to care for all the needs of the jobbing trade. The American Sheet Mills have just opened their books for first quarter business. The price of tin plates has been set at $4.75 base Pittsburgh, while black and galvanized sheets will probably be maintained on the present level, namely: $3.35 base for 24 gauge, one pass black, and $4.35 base for 28 gauge, gal., with blue annealed at $2.50 to $2.60 base for No. 10 gauge. All prices are f.o.b. Pittsburgh. Spelter, having recently suffered a considerable increase in cost, which is holding firmly, will not be an encouragement to users of galvanized products to expect lower prices in the near future.

Current prices:—

Iron bars, base	3 15 to 3 25
Steel bars, base	3 15 to 3 25
Reinforcing bars, base	3 15 to 3 25
Steel hoops	4 00
Tire steel	3 25 to 3 40
Spring steel	7 00
Band steel, No. 10 gauge and 3-16" base	3 65 3 75
Small shapes	3 40
Sheets, black, No. 28	4 75
Shets, blue, ann., No. 10	4 10
Canada plates, dull, 52 sheets	5 50
Canada Plates, all bright	7 00
Galvanized Sheets, No. 28	6 50

Boiler Tubes.—The demand is not very brisk at present, which is probably a good feature as supplies in warehouses have been reduced to a low level as a result of the backward conditions at the mills. Deliveries from mills have for some time been considerably deferred and supplies have not been replenished at anything like the rate at which they have been disposed of, and on this account there is a possibility of advances being announced shortly, as there are no appearances of improving shipping conditions at the various mills.

Pig Iron.—Pig iron market is somewhat more active, particularly as regards operations of two or three of the larger companies, and reasonable buying has been done for deliveries extending over the next three months. Fair inquiry has also been received from foundries throughout the province, but as yet most of the orders are being placed for import iron which continues to sell at under the prices asked for Canadian product. The season of navigation is now about to close and metal arriving is being disposed of by importers for shipment from the dock, but it is anticipated that once the direct import supplies have been shut off and such importers as have put iron into stock ask higher prices from warehouse than from the dock (this necessitated by additional charges in the way of cartage, storage, interest, etc.), Canadian producers will stand a better chance of securing what business is going. So far as I can learn, the tonnage of iron being put into store by importers here is comparatively small and will probably be peddled out in small lots at remunerative prices.

A rather quiet period during the balance of this year is anticipated, but the general feeling seems to be for a slower demand for product entering into building construction during the winter months, but the consumption of iron for use in general foundries manufacturing castings for machinery trade, etc., will probably show some improvement.

Prices on pig iron in the United States have shown considerable reduction during the past few weeks, but taking into consideration the present costs of manufacture it is felt that this has been somewhat overdone, and advices received by us from prominent manufacturers are to the effect that there will probably be better business, with upward trend in prices, after the beginning of next year. Premium prices for quick delivery on steel, made by U. S. manufacturers, have been more or less wiped out, and the basis is now somewhat lower than it was two or three months ago, but in view of the high costs of manufacture and probable further advances in labor costs, I do not see how prices can show much more reduction without serious loss to manufacturers. Generally speaking, the tone is hopeful, with fair amount of business moving. Current prices:—

Algoma, No. 1, car lots on tracks, nominal quotation	36 15
Summerlee, 30-ton lots, dock	35 00
Carron, 30 ton lots	35 00
Do., 5 ton lots, ex. warehouse	40 50

Non-ferrous Metals.—The metal market has been somewhat easier this week, especially in tin and zinc. The advance, however, in both of these metals has been so rapid that a reaction is not surprising. These two metals reflect an attitude on the part of both American and English producers and consumers, the one trying to depress and the other to advance prices. England is forced to come to the U. S. A. for zinc and naturally does not wish to pay more than is absolutely necessary. Tin, on the other hand, is controlled by Great Britain and they are naturally desirous of making the Americans pay as stiff a price as possible. Outside factors naturally have some effect but the situation at present is a fairly even one and it is not easy to say what the next movement will be. We are naturally entering into a quiet period of the year and with lessened consumption there may not be much change.

Business generally is better than at this time last year but somewhat quieter than a month ago. Business will probably be quiet until the turn of the year, when there should be an improvement. Current prices:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	45 00
Lead	8 00
Spelter	9 25
Antimony	7 50
Aluminum	22 00

Pittsburgh

November 29.

PRODUCTION of steel ingots is at a trifle above 40,000,000 gross tons a year, which was the rate in October. This represents an operation of the steel industry of between 75 and 80 per cent. of capacity. Production is at the highest rate since October, 1920.

In the past few weeks there have been numerous business reviews, from various sources, all suggesting that "business is going to be better." There has been such unanimity in these reports that the observer may easily be deluded. Presumably the average man does not wish to be deluded, but prefers to have the actual facts. There has been much talk in the past two years of "the business cycle," which has it that business improves for a time, stays good for a time, declines and then stays poor for a time. All these reviews say that business has been growing better, and then infer that it is going to continue growing better.

There has been a secondary inflation. At first the inflationary tendency was resisted strongly by the large and conservative banking and industrial interests, but when the United Mine Workers won their great victory last August, fastening upon the country a coal producing cost outrageously out of harmony with economic principles, this resistance was largely withdrawn, with idea that the inflation would perforce have to be allowed to run its course.

The question really is how much more of the course remains to be run? Already there are some observers who believe it is through. None can show that there are many more months. The business reviews infer that because business has been improving it is going to continue to improve, but that is no argument according to the business cycle principle or according to the fact that already there has been inflation. Steel production has been increasing since July, 1921, 18 months, which is rather a long time. Steel prices turned upward last March, eight months ago.

Consumption Increases

A very crucial fact, that should be kept prominently in mind, is that since October 1 steel production has been at a rate more than 15 per cent. above the average rate in the six months preceding, which period certainly began with no stocks, so that consumption could not have exceeded the production. Consumption now must, therefore, be more than 15 per cent. heavier in order to maintain a balance, and it is hard to expect this in view of the season of the year.

Markets are made by men as well as by materials, hence the psychology of the situation must be considered. The great coal strike was expected to interfere with production and men were disposed to buy as a safeguard. Now the coal strike is over, and the railroad congestion that was expected to follow has shown what it would amount to, the fears of buyers are removed, yielding to a feeling that one can get steel whenever he takes a notion to place an order. Sellers' market and buyers' market alternate. Capacity to produce steel increased since 1913 more than ability to buy steel, but great operating difficulties, practically unknown before the war, have intervened to prevent the full capacity being available for production, and on this account there has been more of a sellers' market than would otherwise have been the case.

Sheet and Tin Plate Prices

November 23 the American Sheet & Tin Plate Company (Steel Corporation) made its long-awaited announcement as to prices. Contrary to expectations, very generally entertained four to six weeks ago, and to some expectations that still survived, there were no advances, former prices being continued throughout. The company's prices are: $4.75 for 100-pound coke tin plate, first quarter to jobbers, first half to manufacturing consumers; sheets for first quarter to all buyers; blue annealed, 2.50c; black, 3.35c; galvanized, 4.35c; automobile sheets, 4.70c.

Talk of prospective advances has been so widespread that an explanation why there are no advances may be in order. It has been argued that tin plate did not advance since last March while all other steel products did, hence tin plate ought to advance now. The $4.75 price was, however, rather a high one for the conditions existing a year ago, and most of the time since then, until recently, it has been shaded by independents, sometimes deeply. Thus there really has been a market advance though not an "official" advance. In 1920 the Steel Corporation's prices were very far below the independent prices in all steel products, and in the past few months the corporation has in general been below the independents. The corporation wants a reputation in this respect and treasures it, and naturally it must have been very irksome for this relatively small commodity of tin plate to be an exception to the general rule.

In the matter of sheets, the independent market in September and October was well above the corporation level, but in the past few weeks black sheets first declined to the corporation price of 3.35c and then galvanized sheets declined to its 4.35c price. When the corporation advanced at the middle of last August, to the present prices, it was following advances previously made by independents. This time making an advance would have been taking the lead, and it is altogether doubtful whether the lead would have been followed, or at least maintained, up to April 1.

An argument was made about raw material, the $40 sheet bar price being cited. The practical fact is that the sheet bar market follows the sheet and tin plate market and does not make it. That is market history. It is merely theory to say that sheet bars are the raw material. Only a small proportion of the sheet and tin plate output is made from purchased bars, the great bulk being by mills that make their steel themselves. The market turnover is much smaller in sheet bars than in sheets and tin plate, in other words it is the subsidiary market. Sheet bars will have to come down. They are already down to $37.50 or $38, and probably they will be under $35 for first quarter delivery.

Bars, shapes and plates continue quotable at 2.00c as the ordinary market, but no effort is made to keep it secret that desirable orders can be placed at slight concession at least. Pipe is very strong, there being virtually a famine in ½ to 2-inch, on account of the unprecedented boom in garage and dwelling house construction. Nails for the same reason are strong and far from plentiful.

Coal, Coke and Pig Iron

That the general market situation is without coherence, with prices fortuitous instead of being logical and properly supported, is shown by the fact that last week coal declined 75 cents a ton, while coke, which it is well known is made from coal, advanced 50 cents and pig iron, which it is equally well known is made with coke, declined $1. Latest quotations are: Pittsburgh district steam coal, $2.50 to $2.75; Connellsville furnace coke, spot or prompt, $7.25 to $7.50; valley pig iron, $30 for Bessemer, $27 for basic and $27.50 for foundry. The pig iron prices given are practically asking prices and might yield on appearance of an interested inquiry.

STEEL PRODUCTION INCREASES

American Steel production passed the 1913 average in the second quarter of this year, with output of 8,906,000 tons, or 17 per cent. more than pre-war standards. British production in that period was 66 per cent. of the 1913 average. France and Germany are behind England in this regard.

American ingot production declined in the third quarter, as compared with the second, principally as a result of the coal and rail strikes, which forced closing of many plants. Production of pig iron was far below the average of 1913 in both England and the United States in the first three quarters of the present year. The American industry, however, led the British in approaching the pre-war average. British pig production was: First quarter, 977,900 long tons, or 38 per cent of the 1913 average; second quarter, 1,171,400 tons, or 45 per cent. and third quarter, 1,241,100 tons, or 49 per cent. American pig production was as follows: First quarter, 1,296,000 tons, or 89 per cent. or the average 1912 output; second quarter, 1,267,000 tons, or 87 per cent, and third quarter, 1,548,000 tons, or 81 per cent.

British coal mine owners hope to build up a permanent export trade in coal with Canada. Officials of the Canadian Government Merchant Marine are encouraging the idea.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

Toronto price:—

Silicon, 2.25% to 2.75%	$33.80
Algoma, No. 1, Montreal	36 15
Summerlee, Scotch, Montreal dock	35 00
Summerlee, Warehouse, 5-ton	40 50
Carron, Montreal docks	35 00
Grey forge, Pittsburgh	28 77
Lake Superior, charcoal. Chicago	36 15
Standard low phos., Philadelphia	38 00
Bessemer, Pittsburgh	33 27
Basic, Valley furnace	$27 to $28

Factory Cost—From Rough Castings to Product

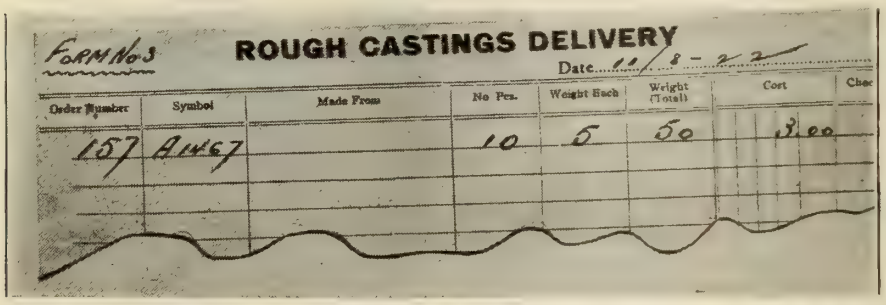
Prime Cost and How to Find It—Accurate and Practical Way to Record Foundry Operation—Time-Keeping Methods—Operators' Point of View Not Always Reliable

By A. LUENBERG

Article No. 2

TOTAL cost to manufacture and sell consists of raw materials, cost direct labor, indirect expense or overhead, and selling expense.

Cost of materials and cost of direct labor make up what is called "Prime Cost."



FORM No 3 ROUGH CASTINGS DELIVERY

Date 11/8-22

Order Number	Symbol	Made From	No Pcs.	Weight Each	Weight (Total)	Cost	Chec
157	A1467		10	5	50	3.00	

Form No. 3—Materials sent to production are listed on castings delivery sheets such as these.

Indirect expenses, overhead or burden added to prime cost give "Factory cost." The expense of selling product, added to factory cost, give "Total Cost" to manufacture and sell. Total cost, plus a fair profit, is price product should be sold for.

For the benefit of manufacturing concerns making their own castings and foundries, an accurate and practical way of how to find cost of rough castings was outlined in edition of November 9th.

Chart No. 1 of this issue, is very effective to show efficiency or deficiency of foundry. Every heat is marked down from heat reports showing percentage of good casting, foundry returns like foundry bad castings, drop, shot, gangway, etc., and shrinkage.

Indirect expense or overhead will be discussed in a later article.

How to Find Prime Cost

Costs may be made up of machine, piece, yard, ton, gallon, job, etc. No matter what unit of cost is wanted, cost of material, and cost of direct labor are the two components of prime cost.

Where cost of tonnage is wanted, prime cost is very easily found. Total tonnage produced in a given time is divided in wages paid workmen actually employed on product during that time. This done, result is direct labor cost per ton. Cost of raw materials used for a certain period, plus cost of direct labor for the same time, divided by tonnage give prime cost per ton of product.

Actual time spent by employees on jobs is in many cases taken from clock cards. Workmen entering plant in morning ring in and by leaving at night ring out their cards. It is taken for granted employees worked on jobs every minute of the day. Breakdowns and delays caused through repairs are not taken into consideration. Clock cards are summarized at end of period, totals of same entered on cost summary sheets and this is the end of finding direct labor cost. This method may work out for a manufacturer with no competition and making his own selling prices, but as to knowledge of cost to manufacture, he has none.

Time-Keeping Methods

Keen competition and large fluctuations in prices have made it necessary to install up-to-date time-keeping systems. In addition to the ordinary clock cards, daily time sheets like your No. 2 are used. Machining orders, like No. 5, are made out for stock as well as productive assembly orders showing order numbers, symbol numbers and name of parts, number of pieces ordered, production centers parts have to go through, date finished and received in stockroom.

Materials sent to production centers are listed on castings delivery sheets, form No. 3 or requisitions form No. 4, giving exact information as required on stock order No. 5. The stock order card follows material from production

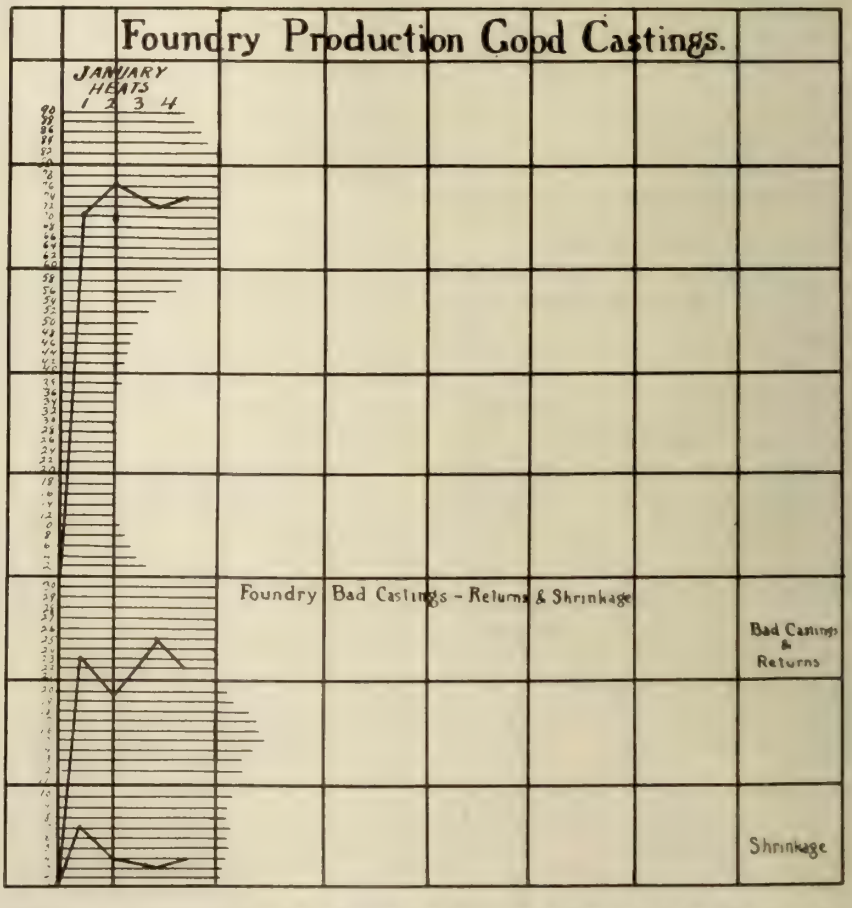


Chart No. 1—Useful in showing efficiency or deficiency of foundry. A complete record of production.

Form No. 2—Daily time sheets to supplement clock records.

center to production center until parts are finished and received at stockroom.

When making out rough castings delivery sheets as requisitions, great care should be taken as to exact weights. Only too often are materials handled in a very wasteful way and nobody seems to care about it, good money being paid for same just like that for direct labor.

Production center operations like planing, milling, drilling, etc., can be numbered for convenience and chart of same kept on back of daily time sheet.

Time consumed on stock order jobs or assembly orders should be filled in on time sheets as soon as work is done. This may be done by operator himself, foreman or special shop clerk.

Under no conditions should employees be allowed to make out their time sheets just before quitting time, especially where a large number of different orders are handled by each workman and individual time on jobs is sure to get mixed up.

Daily time sheets signed by foremen must not be accepted as indications of time being correct as detailed on them.

Form No. 5—These are made out for stock as well as productive assembly.

The operator, filling out his time sheet at the end of the day is more intent on showing he was working every minute while in the shop than giving information of actual time used on each job. No allowance is made for idle time, time used repairing machines, or wasted waiting for tools or other indirect labor performed by him.

For manufacturing concerns, where it is necessary to know cost of parts to arrive at cost of complete unit, time recorders are installed in every department and used in connection with daily time sheets. Time of start and stop is punched on recorder against every job or order number, giving the exact time it took to do the work. Standing order numbers are made out every month to take care of indirect labor performed by operators, totals of which are finally absorbed in general overhead expense. This system may look too far-reaching, complicated, and expensive, but as only intended for large concerns, it is, if once installed, easily operated, and through giving information sought, soon pays for itself.

The average small manufacturer can get along with the simple daily time sheet system made out by operator and signed by department foreman. If accurate cost is wanted and large competition to figure with, the time recorder system is preferable.

If you don't get to know how much it costs to manufacture, your competitor will and he is sure to beat you on the world market.

Cost systems, as a rule, are looked upon by employees as slave-driving monsters. In many cases very little is done on the side of workmen and foremen to keep system in proper function.

Employees demanding fair wages should bear in mind that manufacturer is entitled to a reasonable profit which can only be arrived at by ascertaining proper factory cost through efficient cost systems.

Daily Time Sheets

Cost summary cards like form No. 6 are made out and filed at cost department. Materials received at production centers are shown on delivery sheets and requisitions and prices summarized, and entered on cost summary cards.

Form No. 6—Cost summary cards such as this are made out and filed at cost department.

Daily time sheets, where summarized, and distribution taken for payroll, are sent to cost department and time is entered on cost summary sheets against the order numbers as shown in form No. 6.

Nothing but actual time used by operators on jobs is entered on cost summary cards; any indirect labor done is chargeable against standing order numbers for such purposes.

All direct labor entered on cost summary cards for a certain period should show the same total as direct labor payroll for the same length of time. It is very important to make check like that once a month, to insure proper working of cost system and finding mistakes made either by cost clerks or time office. A cost system properly operated as outlined above is sure to give satisfaction.

When finished parts are received at stock room, stores receiving slip, form No. 7 is made out and sent to cost department indicating that direct labor is completed and cost summary card must be pulled and summarized. A stock record card like form No. 8 is made out for every part, showing in addition to all other information the factory cost price per piece.

CANADIAN IRON ORES GOING TO GERMANY

A RECENT article in this paper from its Newfoundland correspondent, pointed out that much iron ore had been purchased during the past year by Germany from the British Empire Steel Corporation. Germany has been having difficulty in securing supplies of ore to meet manufacturing requirements and her metallurgists are thus turning their eyes towards Sweden and towards Canada or rather towards Newfoundland as sources from which iron ore may be procured. Much capital would be necessary to erect furnaces and re-establish the industry in Germany, but undoubtedly the capital would be forthcoming if the economical advantage of the investment was apparent.

It is very obvious that if Germany engaged in the iron industry in this way, manufacturing iron in Germany would speedily assume large proportions, writes Prof. James Mavor, Ph. D., in The Financial Post. The effect of this upon the demand for Canadian iron ore is obvious. The price of it would be driven up at once.

It is difficult to believe that the relatively high price of labor in Canada would permit of the competition of the iron manufacturers there with the French enterprises afflicted as they are with an excess of iron which they cannot sell, or even with the English manufacturers, so that the only real possibility of trade would lie in iron ore. If, however, the demand of Germany resulted in a prohibitive price for iron ore in this country, the blast furnaces in Nova Scotia would become idle. Under these circumstances, there might arise an irresistible demand for the imposition of a high export duty upon iron ore. Whether Newfoundland would or would not favor such a measure remains to be seen. It may be that Newfoundland would take the view that whether her iron ore went to Sydney, Cape Breton or to Bremen or Hamburg was economically a matter of indifference to her. Much, of course, would depend upon the quantity of iron ore available which was not subject to lease, or other contract obligations extending over future years. It is doubtful if Germany could get all the ore she requires from Sweden; but in any case demand for that product would stimulate the industry in that country as well as in Canada whether ore was exported from this country or not.

There is observable, however, an increasing disposition on the part of French industrial concerns to open up relations with the Germans to the end of mutual advantage.

News From the Industrial Field

Dominion Chain Co., Niagara Falls, Ont., report a marked improvement in business. They have a force of 105 men at present.

Ford Motor Co. have secured a site for a factory building on the south side of Danforth Ave., East Toronto. Structural operations are going forward at once.

Hanover:—A new company, Hanover Converters, Ltd., has started operations in the plant formerly used by the Hanover Cotton & Woollen Mills. They hope to employ 200 hands eventually.

W. M. Byers, one of the prominent industrial figures of Gananoque, is dead. He was largely interested in the Ontario Steel Products Co., the Gananoque Spring and Axle Co., and the Ontario Wheel Co.

The Conveyors Corporation of Chicago, through their Canadian agents, Cleaton Co., recently sold to Montreal Cotton Mills, Limited, Montreal, one of their ash conveyor systems, together with ash tank.

Bell Telephone are erecting an exchange, the first automatic of its kind in Toronto, on Main St., East Toronto. It will cost $100,000, and will be completed in January. P. H. Secord & Son are the contractors.

Battle Creek Toasted Corn Flake Co., of Battle Creek, Mich., are reported to have purchased a factory site on Danforth Ave. East Toronto, where they propose erecting a plant for cereal production.

St. Catharines.—The new collegiate institute and vocational school now being erected here will cost $475,000 and is to be occupied Sept. 1923. It will have 114 rooms, of which 45 will be classrooms; capacity 1,000 students. It is the only institution of its kind within a radius of 30 miles. The school will include one moving picture theatre for class and entertainment purposes, one auditorium, three lunchrooms, medical doctor's office, six executive offices, one library and two gymnasiums. S. B. Coon & Son, Toronto, are the architects; Geo. C. Cossaboom, resident engineer; W. H. Yates Construction Co., Hamilton, contractors.

Welland:—Canadian Atlas Crucible Steel Co. report improved business during the past month.

L. E. McKinnon, one of the founders of McKinnon Industries, St. Catharines, who was reported seriously ill a few weeks ago, is recovering.

William Rogers Mfg. Co.'s plant at Niagara Falls, Ont., has a production aggregating 300 gross articles per week. They make a line of silver plate and state that they are busier than at any time this year.

Skinner Bros. Mfg. Co., Inc., of St. Louis, Mo., manufacturers of the Baetz patent heaters, have decided to erect a Canadian plant in order to take care of Canadian and foreign business. Fred Skinner reports that they regard Canada as a field of great possibilities.

Calgary.—Up to the end of October, a total of 3,717 threshing machines had been registered in the province, a greater number than has been registered in any previous year. This is indicative of the large crop which is being harvested in the province this year and the consequent demand for more machines.

Welland.—Empire cotton mills are now operating with night and day shifts. There are said to be 800 hands employed. A solid brick extension, completed two weeks ago, is now being used. This company maintains club rooms with recreation and amusement facilities, such as bowling alleys, billiard tables, etc., for the benefit of employees.

Port Arthur:—Provincial Paper Mills, Limited, are putting in a 40-ton-a-day capacity book print mill and the Fort William Paper Co., two newsprint paper-making machines. Other extensions are proposed. Machinery at present being installed is arriving in 65 carloads, 25 for Port Arthur and 40 for Fort William.

Factory extensions now proceeding in Milton, Ont., include the remodelling of a building for the Milton Worsted Yarn Spinning Mills Co., new steel and cement warehouse and office for the P. L. Robertson Screw and Nail Co., and a new printing office for W. Panton. A knitting factory will start operations shortly. Brick-making plants are busy and are erecting new kilns.

Welland.—Page-Hersey Tubes are very busy. There is a strong demand for domestic pipe and shipments of skelp from Pittsburgh district are being maintained with difficulty.

Welland.—Site for the factory buildings of a new industry, Welland Cotton Mills, Limited, has been secured, and it is expected that building activities will shortly be under way.

American Cyanamid Co., Niagara Falls, Ont., manufacturers of air-nitrogen products used for agricultural, chemical and metallurgical purposes, are very busy at present. They have a working force of 800 men.

Welland.—Running 33 1/3 per cent. capacity, Canadian Mead Morrison employ 80 hands at present. Their machine shop for repair purposes on their rope-making machines is equipped with three engine lathes, drills, shaper, grinder and minor apparatus.

T. E. Webster, manager of the Toronto factory of the Diamond State Fibre Co., has just returned from Montreal. While there he looked over conditions in that field and reports improvement. The textile and sugar refineries are particularly active.

BUSY IN ST. CATHARINES

St. Catharines.—Industries here are fairly well employed. The present working forces of the concerns engaged in iron and steel and allied industries are as follows:—

McKinnon Industries, metal workers, 750.

English Electric Co., electrical equipment, 200.

Packard Electric Co., electrical apparatus, 100.

Canadian Yale and Towne Mfg. Co., locks and hardware specialties, 200.

Engineering and Machine Works, industrial and marine boilers, 150.

J. H. Williams Co., Canadian branch, tools, 100.

T. F. Shurley Co., formerly Metal Drawing Co., saws, 130.

McKinnon Columbus Co., welded chain, 125.

Welland Vale Mfg. Co., agricultural tools, 300.

General Forgings and Stamping Limited, Merritton, stampings, 50.

Each of the above firms reports marked improvement in business over the past few months. Several new industries are in prospect for location here.

STARTED WITH $500 AND A DRILL PRESS

"IF YOU keep on watching the time clock while you are supposed to be working, you'll never be more than one of the hands," is a true saying which should be taken to heart by anyone anxious to succeed. W. E. Corman has never set aside a certain number of hours as working hours, but believes in sticking to the task in hand, no matter how long it takes. It is this viewpoint, plus his varied experience and natural ability, that has carried him on. His company recently purchased the complete plant of the Chapman Double Ball Bearing Co., at 347-351 Sorauren Ave., Toronto.

Mr. Corman's career makes interesting and inspirational reading. Born on a farm at Stoney Creek in 1886, he showed and early preference for mechanics. He received his first schooling at the Hamilton Collegiate, and later attended the School of Applied Science in the Toronto University, taking up mechanical engineering. He graduated in 1909.

After finishing his schooling at the Hamilton Collegiate, he decided to study the practical side of mechanics before entering the University, so served his time as tool maker at the factory of the Hamilton Tool and Optical Co. The experience gained during his apprenticeship stood him in good stead as he passed through the University classes at Toronto. On graduating, he entered the service of C. H. and P. H. Mitchell, consulting engineers, and held the position of chief draftsman, finally becoming assistant engineer to C. H. Mitchell, now Brig. General Mitchell, dean of the Faculty of Applied Science and Engineering at Toronto University. While in this service, Mr. Corman acquired a wide range of practical knowledge in design, construction, etc., and supervised the erection of several buildings, installation of heating plants, hydraulic plants, had control over the erection of a number of dams, and also made a survey of certain parts in the Rocky Mountains. He travelled on engineering work as far as Vancouver, and secured a varied and valuable experience while engaged in this way.

The great war also helped to mould his career, and in the second year of the struggle, Mr. Corman was up to his ears in the munition game. He not only was engaged on shell work but entered the time-fuse field as well, and was the originator of many time saving tools to speed up production.

In 1919, the plant of the Corman Engineering Co. came into being, but in a small way. The capital consisted of $500, and a drill press. Although commencing modestly, the firm soon showed remarkable progress. Starting off with general jobbing work, they developed other lines, including cylinder grinding, tool and die-making, rubber moulds, etc., and one of the big features which helped to build up the business was their service to inventors. Speaking of this branch of the business, Mr. Corman says: "I have always liked to develop ideas. In many cases an inventor has a hazy idea of real merit, but does not know enough of the practical end of the business to put it into effect. We have developed our patent model end of the business to such an extent that we really act as patent advisers, and time

W. E. CORMAN

and time again have developed ideas from the very crude state to the finished article, even before the inventor applied for his patent. We have proved in the past that we do not steal secrets, and thus, the inventors trust us with the development of their ideas, knowing they are fully protected so far as we are concerned. I get more real enjoyment out of this end of the business than perhaps any other, for I enjoy creative work."

For some time past, the need of added space and equipment has been felt in the old plant at 58 Stewart St. When the chance came to purchase the Chapman plant, Mr. Corman realized it was what he required, and finally closed the deal. At present he has a number of men working in the new factory, and hopes to have everything moved over within a short time, and properly arranged. In order to avoid confusion, and have his intentions thoroughly understood, Mr. Corman states that in addition to the regular Chapman lines, which include lineshaft bearings, ball and socket pillow block bearings, loose pulley bearings, fan bearings, friction clutch bearings, annular and thrust bearings, automobile bearings, universal elevating trucks, transmission equipment, etc., they would still carry on in a larger way their service in cylinder grinding, rubber mould work, tool and die work, punch press work, job machine and grinding work, also their patent model and general engineering service activities.

In spite of his close attention to business, Mr. Corman finds time for social enjoyment, and in addition to being connected with several societies, he is a live member of the University Engineering Alumni Association, and has been active in keeping together the old boys of the school of Applied Science in Toronto.

LUMBER'S BIG PAYROLL

British Columbia's payroll for the lumber industry in 1922 will run over $20,000,000, according to officials of the provincial government who have based their calculations on returns from 532 firms, whose statistics show that in 1921 the payroll amounted to $18,180,962, with an average number of wage earners of 14,500.

The general resumption of building operations, followed by an increasing demand for lumber, has had the result this year of speeding up the industry. Many plants that were idle have resumed operations, and even those which kept going all the time through 1921 have increased their staffs.

It is confidently expected that this year will show a big increase over 1921, and the $20,000,000 mark is said to be on the conservative side.

CANADA MOST FAVORED

The Water Power Committee of the Conjoint Board of Scientific Societies of Great Britain has issued a report on the water-power resources of the world, showing the British Empire to be far in the lead, with 50,000,000 to 70,000,000 horsepower capable of immediate economic development. It is estimated that 75,000,000 horsepower is being used for the world's factories, electric lighting and street railways; 21,000,000 horsepower for railways, except street railways, and 24,000,000 horsepower for shipping.

Canada is the most favored country of all, in proportion to population. South America, Asia and Africa are left out of the calculation because they have had little development yet. As oil supplies diminish and the price of coal rises, the value of water power will increase, and the country that has abundance of this unfailing source of energy has an advantage in the industrial race. Canadians do not yet realize what a priceless asset nature has given them.

American railroads repaired and turned out from October 15 to November 1, last, the largest number of locomotives for any semi-monthly period in the last two years, reports received from the car service division of the railway association show. During those two weeks 13,490 locomotives were repaired. This exceeded by 2,086 the number turned out from October 1 to October 15 last.

Business Newspapers Inform Business Leaders

Select Class of 380,000 Readers Reached by These Publications —"Key Men" in Their Communities—Prosperity Depends Upon Exchange of Ideas and Experiences—Gospel of Intelligent Work

By HORACE T. HUNTER*

BUSINESS newspapers are specialized publications covering intensively some particular field. For example, there are 3,000 hardware merchants in Canada. "Hardware and Metal," the business newspaper in that field, has a paid subscription list of ninety per cent. of these merchants and in addition 800 manufacturers, wholesalers and travelers, who are also subscribers. Its influence and importance will be apparent, however, when you consider that its readers sell each year $170,000,000 worth of goods, and these readers look to this publication for information and advice with regard to all matters pertaining to their business.

Another publication, "Canadian Grocer," has a circulation of 6,000 which, although less than half the number of men engaged in the grocery business, yet our figures show that these 6,000 grocers who subscribe to their trade newspaper sell 75 per cent. of the groceries that are sold in Canada. This figure has been placed at over $200,000,000.

There are more than a hundred other business publications but these two will serve to show the thoroughness with which these papers cover their fields and the enormous business done by these fields.

Practical Technical Education

Do you realize that the industrial prosperity of Canada is, after all, merely the prosperity of these 100 lines of business; that the prosperity of any one line is dependent on the men in that industry exchanging ideas and experiences? In medicine the doctor is the heir to all research work that has been done up to the present time, but he must study and acquaint himself with thesee discoveries. That is a work that is never done. And so in every line of business more efficient methods are always being introduced and as they are tried out and proven successful they must be passed on to others. There is only one method of doing this in a systematic way and that is through the business publications.

If the business publication in most any field increases the efficiency of its readers only ten per cent., then they have added millions to the wealth of the country.

Broadening Out

Business publications are very largely the product of the last fifty to seventy-five years. Before business papers existed, a man looked on his competitor as an enemy from whom must be concealed all plans, methods and information concerning his business. To-day, most business men look on their competitors as associates and nearly every line is organized with a view to discussing and finding a solution for problems common to all. The business newspaper has played a large part in this broadening out attitude of business men. In the early days they found an odd man here and there who was broad enough to see that it would not hurt his business to give out information about it. They published these experiences and as no dire catastrophe overtook these men who had given out these business "secrets," others followed their example. This has opened up a great field for business papers. As you will realize, it is always of interest and value to one business man to know of some plan adopted successfully by another man in the same line of business.

The MacLean Organization

The MacLean Publishing Company, whom I have the honor to represent in Rotary, was established thirty-five years ago. We publish fourteen business newspapers and one general magazine.

We have a staff of upwards of four hundred and in addition correspondents scattered in all important centres throughout Canada, also in the United States and Great Britain.

We spend over $500,000 each year in securing news and information of one kind and another for our readers. This is exclusive of mechanical costs, circulation, accounting and other clerical expense.

Unprejudiced and Unbiased

We have no other entangling alliances. The directors of the company are not now and have never been financially interested in any other company whose interest could in any way conflict with giving an unbiased and unprejudiced service to our readers. Our readers pay us to give them all the informatioon we can gather that would be of interest and value to them. We accept this as a trust and have never suppressed such news even though we knew it would mean loss of advertising or subscribers, or estrangement of friendship on the part of readers who have desired to have information suppressed, or who have disagreed with our views. We have not done this merely on high moral grounds but because it pays—because it is the only foundation on which to build a successful newspaper.

Business newspapers in Canada have a circulation of approximately 380,000. This statement in itself means little until you examine more closely and find out that these 380,000 men are "key" men, they are leaders in the community in which they dwell. They are such men as are members of Rotary Clubs, Kiwanis Clubs, and other like organizations. They furnish employment for the entire industrial population of Canada. They manufacture the goods; they act as wholesale and retail distributors; they build railroads, steamships, hotels, homes and factories. They are the bankers who make the loans and they are at the same time the men who borrow the money from the banks to carry on their various industrial enterprises. They are the men who operate the mines and the lumber camps. They are the men who plan practically all industrial operations, for practically every industry has its specialized publication. They are, then, the officers of a great industrial army and, while I would not for a moment minimize the work of the private, if you want to keep up the morale of an army, if you want to train them in some new form of strategy, you must work through the officers. If you have poor officers you will have a poor army; but if you have brave, intelligent and resourceful officers you will have an army that will meet any emergency.

Field of Business Papers

This influential body of business leaders numbering nearly four hundred thousand, or five per cent. of the population, have many interests in common. Business newspapers are the only mediums which can express their viewpoint and give them the leadership that is necessary to weld them into united action. Daily newspapers cannot do this work for the interests of their subscribers are too diverse. A metropolitan daily with a circulation of a hundred thousand would have only about five per cent., or five thousand, of these industrial leaders as subscribers. The dailies with their mass circulation exert great influence and have great responsibility, but the editors of the biggest and best of these publications recognize that business publications should take the leadership with business men on business questions of great national importance. C. P. Scott, editor "The Manchester Guardian," stated recently:

"There never was a time when business newspapers could do a better stroke for the world than they can to-day by bringing it home to their readers and the great public that all the peoples

*Address delivered before the Rotary Club. Toronto. Mr. Hunter is Vice-President of the MacLean Publishing Company.

profit by the peace and prosperity of each other.

"They are the most practical of internationalists and through the sensitive machinery of the market can estimate from day to day the reactions of policy and the supreme value of a settled order in the relations of states.

"They, better than anyone else, can realize the fallacy of the view on which nations have too often acted that what is one nation's gain must be another's loss. The world as we see it to-day is largely what politicians and statesmen have made it. Is it not time for the business man to take a hand?"

Lord Burnham, proprietor "Daily Telegraph," London, expressed his views as follows:

"Everything that increases mutual knowledge of the achievements and possibilities of industry and commerce increases the welfare of the people and acts as a stimulus to further progress.

"In this respect business newspapers perform functions which no general newspaper can undertake, and a limit can be set to their useful development only when a limit has been set to the march of knowledge or science, whichever you prefer to call it, as applied to production, commerce and finance."

National Publications

Business publications are all national in scope and look at every question from the national viewpoint. I might touch briefly on a few of the more important questions they have dealt with during the past few years.

They have advocated business administration in municipal, provincial and federal governments; that the captains of industry who have made a success of their own business should be drafted into the public service. We believe business men would readily undertake public service work if they were assured that they would be immune from political influence or dictation. As a means to this end, they have urged that successful business men of high standing and character should be sent to parliament.

Elimination of Waste

War breeds extravagance. In spite of the noble ideals which inspired this nation to take up the great conflict across the sea, the inevitable result was the accumulation of innumerable waste and habits of extravagance. Business papers are exposing these wasteful methods wherever they can be found, and once the facts have been placed before business men the first step has been taken towards their elimination.

Waste of Time

The greatest waste of all is the waste of time, either through carelessness, laziness or inefficiency. As one business editor has put it: "We cannot talk ourselves into prosperity; we cannot argue ourselves into stability; but we can work ourselves out of the valley of depression and up to the heights of plenty." If business paper editors can instill into the 380,000 business leaders in Canada this gospel of intelligent work we will have performed a tremendous service.

Readjustment

Business papers reaching manufacturers, wholesalers and retailers aided and speeded the period of readjustment by urging the sale of goods at replacement values; by emphasizing week in and week out that the problem was an individual one; that every business man must have the courage and the energy to keep his own business going, and that if this were done business would resume. What we require during a period of business depression are not advertisements urging people to buy in order to aid employment and bring about prosperous conditions. What we require is that every individual business man should advertise his goods and show why those particular goods should be bought at that time. People will buy goods if they believe they are getting value for their money and I believe they will buy them for no other reason.

Co-operation With Government

In the United States the editors of business newspapers have a weekly conference with Mr. Hoover, secretary of Commerce. Mr. Hoover's job is to extend American business both at home and abroad. He discusses with these editors the business situation and outlines certain facts that come before him that he believes should be brought to the attention of business men. He knows that the editors of business papers who attend this conference can bring these facts before the respective fields covered by their papers in a forceful and attention-getting way that their experience fits them to do. We have urged such a plan on our minister of trade and commerce but the traditions of the Canadian department have evidently been to adopt what I might term more indirect methods. We are hoping the new minister, Mr. Robb, will realize the importance of the opportunity, that he will regard himself as the sales manager for Canada, and utilize the business press to keep in constant touch with the leaders of business in the various provinces of the Dominion.

Export Business

Those business newspapers carry representative advertisements in the field they cover. Every publication has scores of instances where their goods have been introduced into foreign countries through these advertisements being seen by buyers in these foreign countries. Some of these instances date back thirty years and during that time hundreds of thousands of dollars have been sold. This has helped to swell our export trade and put the Canadian dollar at a premium in every country in the world.

But the responsibility of business men, and therefore of business newspapers, does not stop with national issues. They must grapple with international questions. Our markets are affected by conditions in Russia, in Germany, in United States, Japan and all foreign countries. Business men cannot afford to make investments in new plants or in wider sales plans without knowing something of the world situation. Editors of business newspapers are close students of foreign conditions—some of them go abroad regularly to study conditions at first hand.

In 1915 "Canadian Machinery" issued four special Shell Numbers, March 18, April 29, July 1 and September 2. First in America, if not in the world, to enter munition shops and publish reliable information concerning shell manufacture, "Canadian Machinery" performed a distinct service to engineering concerns in several countries and to the Empire and Allied cause.

Working with the full consent and co-operation of the military authorities, our editors were able to secure the most detailed information and photographs. So valuable were our Shell Numbers considered that they were in demand in all allied countries and in the United States. The Munitions Committee of Australia reproduced in pamphlet form the entire editorial contents, illustrations and all, of our Shell Number of July 1, 1915.

The advertising pages in these special Shell Numbers as well as in regular issues proved of the greatest service in equipping shell shops.

Your Responsibility

This, then, is something of the work done by business papers. They have, however, only scratched the surface. There is much more important work still to be done. I would like, in conclusion, to leave with you this thought: You business men are vitally interested in the development of business papers. You are interested in the development of business newspapers just as you are interested in the building of railways and canals. Railways offer a means for the transportation of the goods, but the business papers have first exerted their influence to help you sell the goods. I say, therefore, in your own interests give business newspapers all the assistance and encouragement you can. Advertise in them and you will get not merely the value of the publicity but you will enable the publisher to spend more money on service to readers.

A couple of days ago Babson painted a very vivid picture of the 100,000 or more retail merchants scattered in towns and cities through Canada. He said that when prosperity is to be brought back it will be through the efforts of these merchants. For it is only as their shelves are cleared that more goods will be required. Therefore, he said, co-operate with them, give them ideas to help them sell the goods. Business newspapers offer the only direct line of communication with these merchants. They offer the only means of reaching them with publications they have subscribed for and which have become part of their business.

Williams Re-Manufactured Machine Tools

You can save a lot of money by buying our used machine tools, because you get machines that have been thoroughly re-manufactured and trued-up—machines that are guaranteed absolutely as good as new, much below new prices.

Why pay full price for a tool when a much smaller investment will give you equally satisfactory results?

Our name and reputation constitute a guarantee that any machine you buy will be exactly as represented.

Send us your name and address and we will send you our monthly Machinery List.

The A. R. Williams Machinery Co., Ltd.

64 Front Street W., TORONTO

HALIFAX ST. JOHN MONTREAL WINNIPEG VANCOUVER

MONEY ORDER EXCHANGE WITH CHINA

Arrangements have been made between the Canadian Post Office Department and the Chinese Postal Administration for a direct exchange of money orders between Canada and China. The convention or agreement under which money orders are to be exchanged has been signed by the Chinese Director of Posts and by Hon. T. Charles Murphy, the Canadian Postmaster General, and will go into effect on the 1st of January next.

In times past, the negotiations of such an agreement would have been regarded as a sufficient reason for the visit of a cabinet minister to China, but a new order of things now prevails, and business matters are transacted in the ordinary business way by the exchange of correspondence.

Hitherto, money orders payable in China have had to be issued on British postal agencies at Hong Kong and Shanghai and some agencies of the Japanese Postal Administration, but under the new arrangement all orders issued in Canada payable in China will be reported on lists sent to the Chinese exchange office at Shanghai. The amount of each order will be converted into Chinese currency and a Chinese money order for the amount will be forwarded to the payee.

Orders issued in China for payment in Canada will be reported to the exchange office at Vancouver in dollars and cents. Canadian orders for the amounts in Canadian currency will be issued and forwarded from Vancouver to the payee.

Direct exchange of money orders with China has been contemplated for a considerable time, but action was deferred owing to the unstable rates of exchange that prevailed during the war and some time after.

BRITISH COAL SHIPPERS LOSE

According to a correspondent in Cardiff, Wales, for an English publication, business in coal with American buyers has not been as satisfactory as expected. The writer states; "By this time many of our merchants on this side of the Atlantic wish they had kept free of the whole business. No fortunes have been made out of it and heavy losses have been incurred. Its greatest advantage was the fillip it gave to business at a moment of considerable depression." There are said to be distinct signs that the business may continue almost indefinitely, however. Factors in the States are of this opinion, and negotiations for the remainder of the year are still continuing. This opinion is held notwithstanding the fact that domestic coals have been offering in larger quantities at the Atlantic seaboard ports. Supplies at Hampton Roads, we learn, are excessive and show some weakening in values. British coal in barges in New York Harbour is still a feature. This is being offered at 8 to 8¼ dols. alongside, but there are very few buyers. With the dollar at 4.45 to the £ it is not difficult to see that a considerable loss is entailed, which, of course, must be increased by unreasonable delay in sales. The cost of this coal at New York must be considered in relation to the interest on money outstanding, the cost of stocking in harbour, and the probability of deterioration in quality. This latter point must be serious, and is not likely to do the same justice to the country of its origin as if it was discharged straight into works.

Inquiry from United States for British pig iron is said to have become less of a feature. The Middlesborough district shipped 9,000 tons to Canada in October and 28,600 tons to United States.

That it will reduce the cost of bar manufacture by 50 per cent., is the claim made for a patent secured by a Pittsburgh roll turner. The present method of rolling a finished bar from which beams, channels, angles, rails, and all structural steel are made, requires two mills, one to reduce the bloom after it comes from the open hearth and one to roll the finished bar. It is claimed this invention shapes the bloom and finishes the bar in one mill, thus, according to the inventor, eliminating hand labor, the roughing rolls and reheating, reducing operations 60 per cent.

T. B. REID WITH JOLIETTE STEEL CO.

T. B. REID, well known in machine tool circles both in Canada and the United States, is now vice-president and sales manager for the Joliette Steel Products, Ltd., of Joliette, Que. His office is Room 115, Union Trust Building, Toronto.

Mr. Reid has had varied experience in machine tool and other work. In 1906 he went to the A. R. Williams Machinery Co., assuming charge of the machine tool department. He remained in this capacity until 1917, when he became secretary-treasurer and manager for the A. R. Williams Machinery and Supply Co. of Buffalo and Detroit, having his headquarters in Buffalo. During this time he was chiefly interested in war equipment, as his firm turned out some 18 special machines for munition purposes. He remained there until 1921, as it took about a year and a half to make adjustments with the American Government.

Since his return to Canada, he has been connected with the machinery sales end for equipment made by the Canadian General Electric Co. and the Russell Motor Co., and only recently completed arrangements to go with the Joliette Steel Products in the position already mentioned. Mr. Reid reports a very encouraging increase in business, and states that they have more than two months steady work ahead. Orders indicate improved railway buying and activity among large manufacturing plants. They are, in fact, reporting better business than for the past two years.

Having been so long associated with the machinery end of the business, Mr. Reid states it to be his intention, later, to open up a machinery department, but the actual policy of this section of the business has not yet been decided.

James L. Waldie, president of the Joliette Steel Products Ltd., is also president of the Canadian Tube and Steel Products Ltd., Montreal, and for the present, both firms will share the same office, Mr. F. Atkinson, the local manager for the latter mentioned firm, still being in charge of his end of the business. Later on, larger quarters will be sought.

MOTOR INDUSTRY USES MORE COPPER

THE rapid growth of the automobile industry and improvements in the methods of construction, motors, parts, etc., have brought with them a marked increase in the use of copper. During the war when the red metal was scarce, manufacturers turned to the use of substitutes, but these proved more costly in the long run and resulted in considerable dissatisfaction among car users. For the past year or more the tendency has been to use more copper, because of its durability and better service.

It is estimated that for the year 1922, the amount of copper consumed by the automobile industry of this country will amount to about 40,000,000 pounds.

This estimate is based on a total of 10 pounds of copper in each Ford car as follows: Radiator 8½ pounds, hub caps 1 pound, gasoline tubing ½ pound and various other parts ½ pound. Assuming a 1922 Ford production of 1,200,000 cars there should be a total consumption of copper by Ford of 12,000,000 pounds.

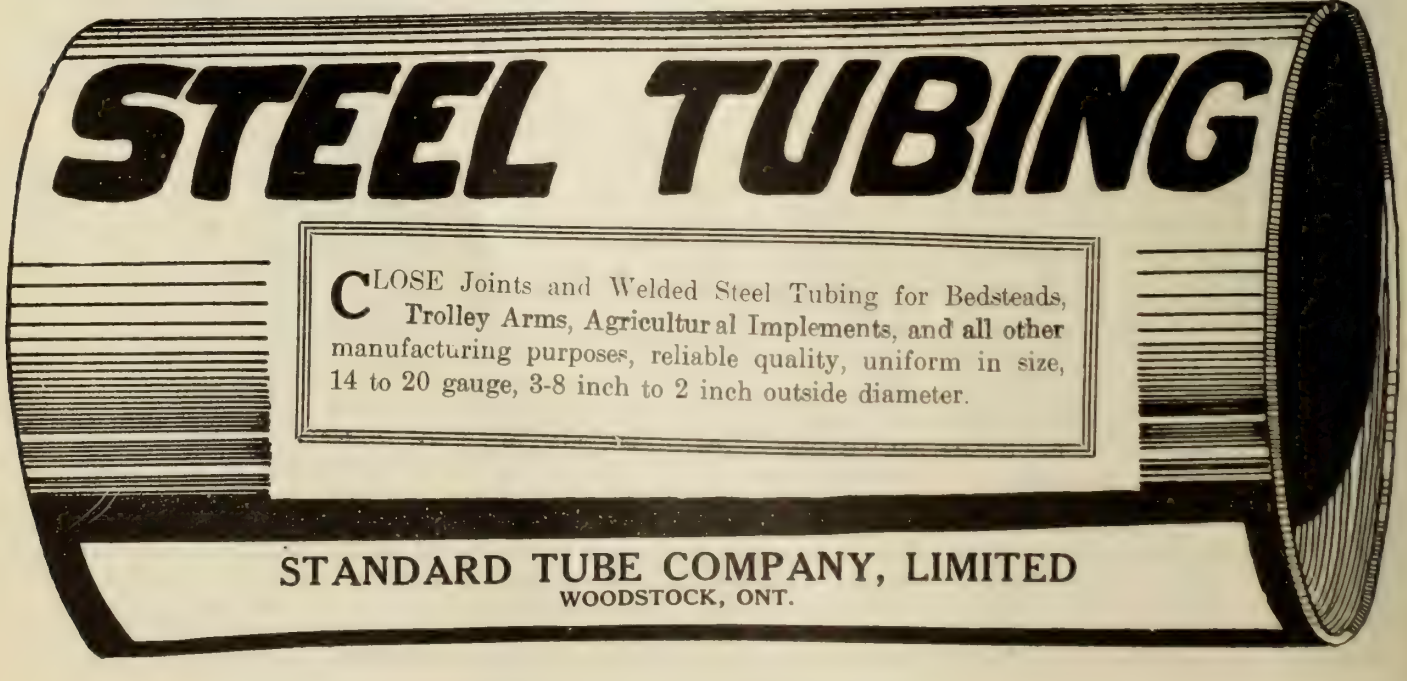
In a Chevrolet there are 16 pounds of copper in the radiator and 3 pounds in various other parts, total 19 pounds.

It is estimated that the average copper consumption a car for all cars except Ford will run at least 20 pounds. Therefore, on basis of 1922 estimated production of 1,500,000 cars other than Fords, copper consumption may be figured at least 30,000,000 pounds. Ford and other makers' consumption combined should be 42,000,000 pounds.

When Ford several years ago gave up use of copper radiator shells because of difficulties owners had in keeping the brass "shiny" about 3½ pounds of copper consumption a car was lost. This meant a loss of from 3,000,000 to 3,250,000 pounds a year to the producers, but it has since been more than compensated for in the increased number of cars manufactured.

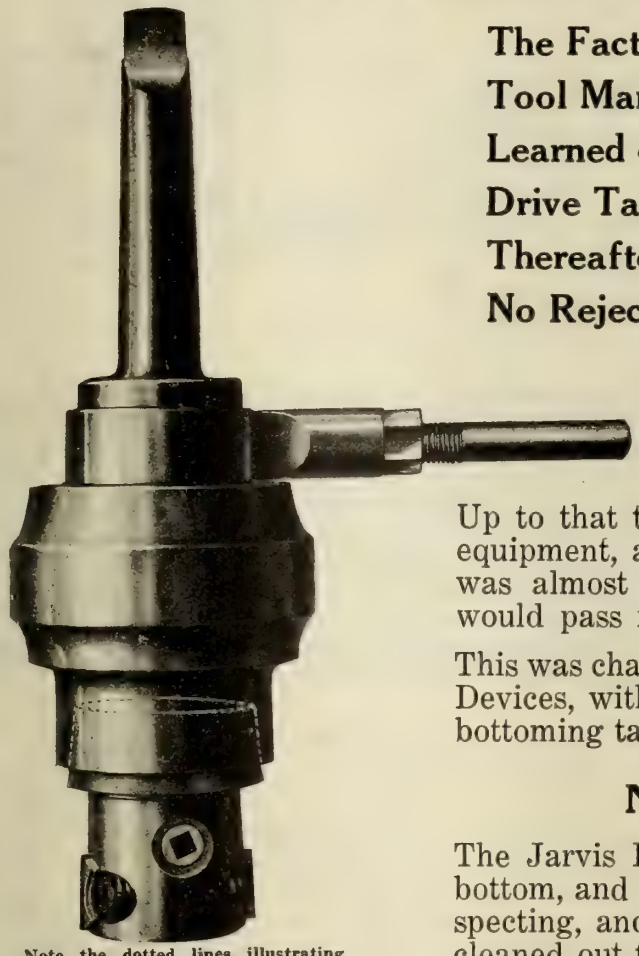
All radiator parts with which water comes in contact must be made of copper, particularly vertical tubes and lateral fins. During the war Ford tried using steel fins because of copper scarcity, but it did not work well and he went back to copper as soon as it became available. He also tried steel hub caps in which approximately one pound of copper is used for each set of four caps, but steel does not take nickel plating efficiently and that plan was abandoned. This re-established consumption of 1,000,000 pounds annually. The same is true of headlight and spotlight reflector backs where copper must be used to hold secure the silver plating.

Japanese steel industry is said to be in such condition that none of the iron and steel manufacturers are conducting business with any prospect of making a profit as the present market price is barely sufficient to cover the cost of material and wages. The potential obstacles that hamper the successful conduct of iron industry in this country are the high wages and high cost of coal.



STEEL TUBING
CLOSE Joints and Welded Steel Tubing for Bedsteads, Trolley Arms, Agricultural Implements, and all other manufacturing purposes, reliable quality, uniform in size, 14 to 20 gauge, 3-8 inch to 2 inch outside diameter.
STANDARD TUBE COMPANY, LIMITED
WOODSTOCK, ONT.

WORKED LIKE MAGIC



Note the dotted lines illustrating position and size of Friction Cone.

The Factory Manager of a Large Tool Manufacturing Concern Learned of the Jarvis Friction Drive Tapping Device, and Thereafter There Were No Rejections.

Up to that time they had been using regular standard equipment, and the bottoming taps did not bottom. It was almost impossible to tap the holes so that they would pass inspection.

This was changed like magic when the 20 Jarvis Tapping Devices, with Cone Friction Drive, took the place of 90 bottoming taps.

No Inspection Needed

The Jarvis Friction Tapping Device taps the holes to bottom, and then runs in a second time to do its own inspecting, and when it finishes, every hole is thoroughly cleaned out to bottom.

Very little pressure is needed to drive the device.

The drive is controlled by pressure on the machine spindle.

Stripped threads are unknown.

Holes tapped in toughest metal with little tap breakage.

Standard Chuck.

No special taps required.

The Taps freely started and stopped while rotating.

Adaptable to Drilling Machine or Speed Lathe.

Ask us about the Jarvis High Speed Tapping Devices, which act without clinching or binding.

And the Jarvis Quick Change Chucks and Collets, for Drilling, Counterboring, Tapping and Stud Setting.

We are sole distributors.

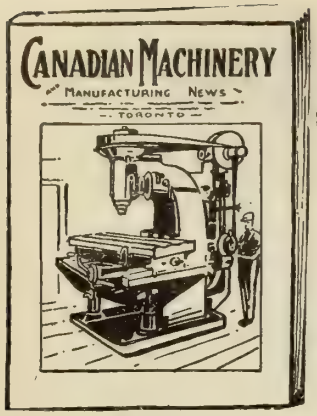
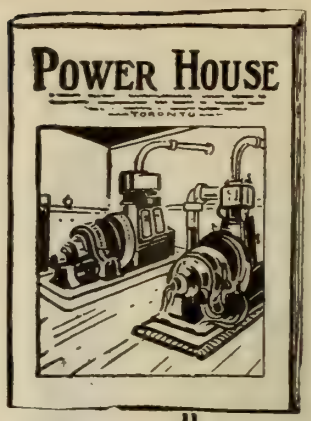
Williams & Wilson, Ltd., Montreal St. John, N.B. **The A. R. Williams Machinery Co., Ltd., Toronto. Halifax, N.S. Vancouver, B.C.**





DO YOU Manufacture Industrial Equipment?

Are you a manufacturer of twist drills, hack saws, mechanics' tools, wire guards, bolts, rivets, paints—do you manufacture lines of any description that can be used in machine shops, metal-working plants, power plants or foundries? If you do the publications you see illustrated here (Canadian Machinery, Canadian Foundryman, and Power House) can build a bigger demand for your products.

This group of technical newspapers is read by the men who are prospective buyers of your lines. You can bring to the attention of these men the reason why they should demand your goods when purchasing from their dealers. You can effectively do this by placing a message in the paper which serves the field in which your products are sold.

CANADIAN MACHINERY AND MANUFACTURING NEWS is published weekly and covers the machinery, iron and steel and general metal-working industries of Canada.

POWER HOUSE is published semi-monthly; it serves steam, electrical, water and gas power plants, and the power houses of all general manufacturing plants.

CANADIAN FOUNDRYMAN AND METAL INDUSTRY NEWS is published monthly; it serves the grey iron, steel and non-ferrous foundries.

Each one of these publications reach proprietors, managers, purchasing agents, foremen—the men who direct the purchasing of goods. A message to these men in any of the MacLean Technical Newspapers is certain to have a strong influence.

Write for complete Data.

$5 May Save You $500 or $5,000!

You work hard for the dollars you save. Properly invested they can be made to work hard for you. But they must be properly invested.

If you feel the need of a guide to show you how to invest your money to bring you the biggest return consistent with safety; to show you how to avoid the pitfalls of investment; you need THE FINANCIAL POST.

It will give you a personalized investment service. Its articles every week will tell you what you want to know about investing. Its discussion of current business and national problems will give you a new angle on economic and political questions. You will have too all the privileges of the Investors Inquiries Department. You may ask as many questions as you like about your own investment and financial problems—the standing of your broker, and the analysis of particular securities, insurance problems, etc. This service is free to all readers.

Stop losing money on bad investments. Invest $5 now where it may save you $500 or $5,000. Pin a $5 bill to this ad. (or your letterhead), write your name and address and we will send you THE POST for one year (52 issues).

THE FINANCIAL POST 143 University Ave. Toronto

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

No Shoulders
No Necks or Bellies

Just the tough back portions of hides, specially selected by experts, are used in the making of

D. K. McLAREN'S BELTING

These, in turn, are subjected to a process of tanning that not only adds to the original toughness of the hides but imparts a flexibility possible to attain only by this

Genuine British Oak Tanning Process

It is to this long-time and expensive tanning process that D. K. McLaren's Leather Belting owes its reputation for "gripping power" and "trouble-free" service on the pulley, even under adverse conditions.

The **Oak Leaf** is stamped upon all D. K. McLaren's Leather Belting as a sign of this efficiency—**Look for it.**

A Short Story About Long Faces

"Boss, ain't you sorry you's baldheaded?"

"Why, no, Sam; I haven't any hair to comb now."

"Dat's so, boss; but you suttinly has a long face to wash."—Boston Transcript.

YOU don't have to be bald to have a long face. Keen disappointment will give you a long face. Chagrin will stretch a man's countenance perpendicularly. If a man finds he has been outmanoeuvred, or if he finds himself a victim of his own lack of judgment you will find his face elongated.

For instance, on the first of January when our "*Annual Review and Reference Number*" goes into circulation a few manufacturers may pull long faces when they see the advertisements of their wise competitors. All other things being equal a strong advertisement in our "*Annual Review and Reference Number*" will give one manufacturer a long lead over his competitor who neglects to take a similar step.

Supposing Mr. Brown, sales manager for Jones & Co., was attending a huge gathering of the leading buyers in the metal-working field. He was asked to give a short talk on his line. He gets on his feet and to his audience he says: "Gentlemen, I have nothing to say." What would the inference be?

Mr. Smith, sales manager for Messrs. Black & Co., attending the same gathering, is asked to tell about his line. In a short, snappy, well-directed talk of five minutes he drives home his message. Which man would create the most favorable impression?

In our "*Annual Review and Reference Number*" you have the opportunity to address not only one but many clients—leading buyers in the metal-working industry of this country. Because of its size and interesting contents, both editorial and advertising, it is kept for months for reference purposes, and not only does it circulate in Canada, but it will be on file in the office of all the trade commissioners and copies are being sent to a selected list of importers in the various foreign countries with which Canada can do business to-day.

Don't start the year with a long face. A good strong sales message in our "*Annual Review and Reference Number*" will make you pleased with yourself and with the world in general. The outlook for business is better than it has been for a long time. This does not mean, however, that you will not have to look out for business.

Start the new year right—write us for particulars regarding space in our "Annual Review and Reference Number" while there still is time.

Two 3 phase Kaelin Electric Steam Generator Units for 6600 volts, designed and built by us for the Laurentide Co., Limited. Capacity of units shown, 7000 boiler horsepower, all controlled by a single operator on each shift.

"Can our idle power be made to conserve our coal pile?"

It's worth finding out and we have the answer.

A number of plants producing or purchasing power but not using it fully at week-ends or other periods are turning this surplus energy into heat by means of

The Kaelin Electric Steam Generator

(Patents applied for)

The generator shown at the left is typical of sizes from 75 to 400 boiler horsepower for 3-phase power. Note its compactness and convenience.

thus securing remarkable reductions in their bills for coal or other fuel.

The saving in labor is also quite important. Altogether, the generator often pays for itself within a short time.

We build these generators in sizes from 5 to 3,500 boiler horsepower, for pressures up to 200 lbs.; also in sizes from 5 to 75 boiler horsepower for low pressure steam heating.

When desired, any of these generators may be equipped with automatic pressure or surplus power control.

Write for Quotations.

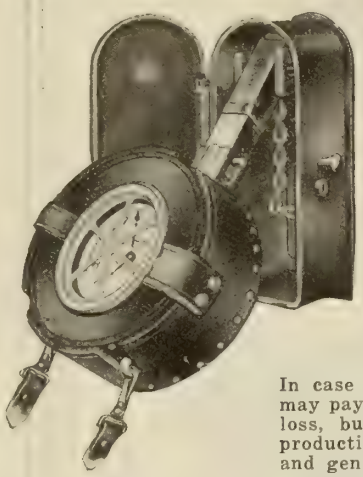
Why Take Chances?



The HARDINGE SYSTEM Protects You

In case of fire, full insurance may pay you for your property loss, but what about loss of production — the laid-off men and general disorganization?

The thing to do is to **prevent** loss and that is just what the Hardinge Watchman's Clock does. It keeps your watchman "on the job" whatever his inclination. With the Hardinge System installed you can rest easy knowing you are taking no chances. It's an **assurance against** fire or robbery and **insurance for** your steady income and production.

Write for our free trial offer.

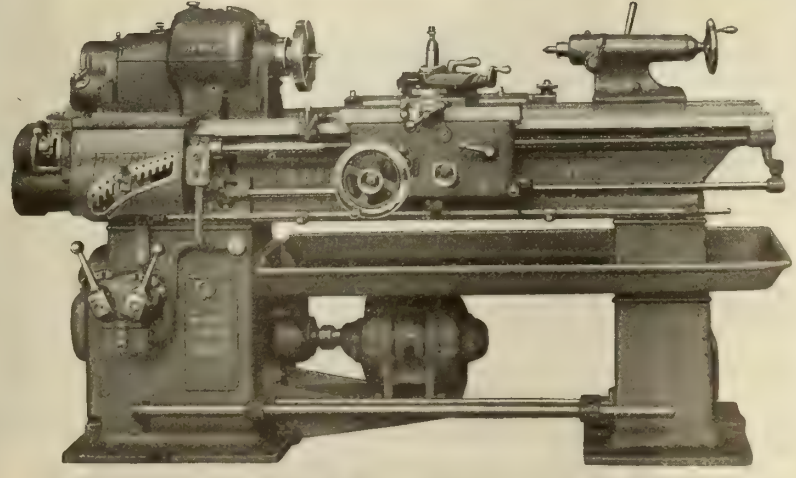
HENDEY



HENDEY 1922 Design (Enclosed Belt to Spindle). Motor Driven Engine Lathe.

SOME FEATURES OF 1922 DESIGN MOTOR DRIVEN LATHE

Power applied to spindle through enclosed belt.

Belt pull on spindle downward.

Belt tension under variable control.

Pulley runs on long sleeve, not on spindle direct.

Nine speed changes to belt, obtained through nine alloy steel hardened gears, sliding on hardened and ground shafts, all running in an oil-tight box.

Lathe head is back-geared, giving a total of 18 spindle speeds.

This lathe develops exceptional power at spindle, and with its ease of handling is capable of a high rate of production.

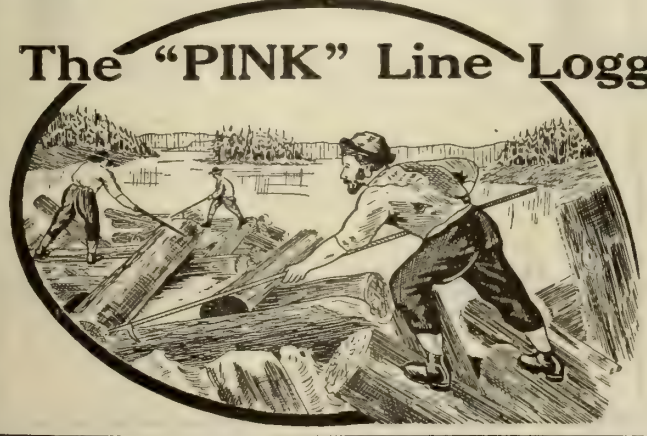
The "PINK" Line Logging Tools and Handles



MADE-IN-CANADA Products---Headquarters for British Empire for all Lumbering Tools

In every lumber camp in Canada you'll find PINK'S famous lumbering tools. They are the favorites there and have won the esteem of all woodsmen through their superior merit. They are world-renowned and are extensively used in Australia, New Zealand and other countries where the lumbering industry thrives.

EXPORTERS TO EUROPE

We export the same good quality of lumbering tools that have made PINK'S TOOLS a by-word in the matter of good tools in all Canadian lumber camps. Enquiries cordially solicited.

"It's your Order, because your Company has a PHOTOSTAT"

"This is a job where delivery is paramount. And, in every case, I have made it a point to find out what kind of equipment the bidder had in order to make good his promise.

"Your company has a piece of equipment on which I have learned to rely. I know what the PHOTOSTAT is and what it can do. I know you will not have to lose any time tracing. You can make PHOTOSTAT copies and get started on your shop work right away. In other words you'll be days ahead and I also know that there can't be any mistakes in PHOTOSTAT copies.

"Yes, sir, you tell your chief he can thank the PHOTOSTAT for this order. I know you'll make delivery with that machine to help you."

PHOTOSTAT prints cost cents. Compare this with what it costs for a draftsman to make a tracing, a stenographer to copy a page, or an artist to reproduce a layout. The experiences of many users, written in letter form, are contained in our booklet, "A Good Word for the PHOTOSTAT."

Write for your copy to-day.

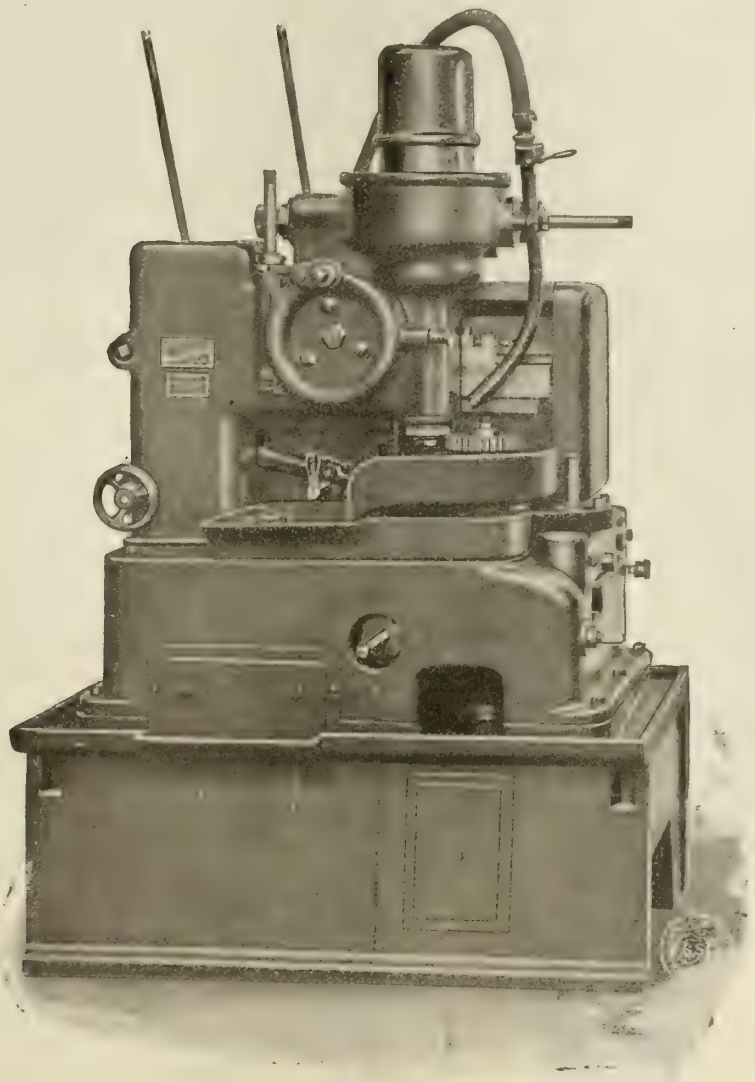
CUT GEAR COSTS
WITH THE
New Production Gear Shaper



The new production Gear Shaper, illustrated, has been designed to cut gear costs. It incorporates every feature necessary in a gear cutting machine to obtain this result, and still one of the outstanding features of the Gear Shaper principle—accuracy—has been maintained.
It is designed to cut one gear at a time and at a speed which eclipses all other methods.
All operating levers are at the front of the machine, permitting a number to be bolted together and operated as a unit, one 6 H.P. motor furnishing ample power for 10 machines
It incorporates to the fullest extent the three principal requirements of production—high speed, accuracy and simplicity of operation.
See illustrated article in all technical magazines
Send for our booklet, "A New Development in Gear Cutting," which has been prepared for the benefit of Engineers and Production Managers interested in the best gear cutting equipment available.

Carbons for Electric Arc Welding

THE electric welding industry has been tremendously advanced by the high development of arc carbons for specific purposes. We manufacture the following grades, named in the order of their current carrying capacities:—

Plain Welding Carbon:
A hard carbon for Ordinary service.

Columbia Welding Carbon:
Very hard. It can also be furnished copper coated, making it suitable for use as a cutting electrode as well as for heavy welding work.

Special Graphite Welding Carbon:
Rather soft and graphitic. High conductivity. Used where a high amperage is required. Used with excellent results on general work.

TRADE NORTON MARK

Alundum Crystolon

How May Grinding Production Costs be Reduced?

Unless your operators are working on fast cutting wheels that do not glaze, do not heat up, or do not load with metal ground, the output of the department per day is reduced.

And in addition—the machine is not producing 100% of its capacity—overhead charges rise surprisingly high—total production costs are far more than they should be.

If the Grinding Expense is to be Reduced to a Minimum—

1- The abrasive in the wheel must be selected which is especially designed to grind the metal in your particular case.

2- The grain size and grade must be such as to prevent loading, glazing, and burning and instead to offer free cutting qualities and the longest possible life.

Try a Norton Alundum or Crystolon Wheel (depending on your work) and test its efficiency.

VOL. NO. XXVIII, No. 23. DECEMBER 7, 1922.

Proper Chucking Ensures Added Production

Several Methods of Gripping Work—Interior And Exterior Locating Mediums—Holding Peculiar Shaped Parts With Special Jaws—Use of Auxiliary Clamps—Where Overhang is Permissible

By J. H. MOORE

IN ENTERING the subject of "how to secure added production by means of proper chucking," it brings to our mind a rather striking incident which occurred several years ago when everyone was striving, day and night, for still greater production. A certain superintendent had managed to boost his production figures on a particular part, and in relating the methods used, said, "Do you know, we actually increased our production rate over 100 per cent. without new tools or machines. All we changed was the form of chuck jaws." He seemed actually surprised at the result, whereas, he should, in the first place, have considered carefully his chucking methods.

Quite frequently too much attention is paid to the tooling and not enough to the style of chuck used. This is a serious mistake, because anything that tends to reduce the time between actual cutting should be carefully considered. When selecting a chuck for general purpose work, one should keep in mind that versatility is an important asset. Select a style that is universal in character, and adaptable to many classes of work. This will often save the cost of special holding fixtures. Special jaws for holding parts of irregular shape can be made at small cost, whereas a special holding fixture usually means greater overhang as well as greater expense, both of which are objectionable.

Consider the chuck in its proper light. It is a very important lathe accessory, an indispensable link which connects the work to the source of power, and the efficiency of an otherwise costly and productive machine can be stultified by the choice of a poor chuck. The requirements of a good chuck could well be summarized as follows—Gripping power, strength, durability and adaptability.

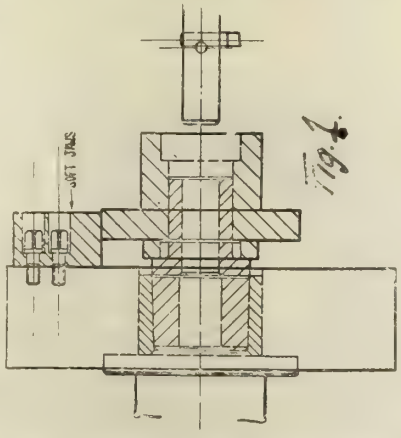

Fig. 1—Showing method of using central locating plug.

It is not the intention of this article to go into the question of design, but rather to show actual cases where good chucking methods have been successfully adopted, leaving readers to study the illustrations at their leisure, perhaps applying some of the same ideas to their own particular product.

When a high degree of concentricity is required between first and second operation work, it is not wise practice to rely entirely upon the soft chuck jaws. If at all possible, the work should be located from the center hole, finished in the first operation. This may be done by means of a true plug fitting in the chuck liner, whilst the outside diameter, finished also at the first operation, can be gripped in the soft jaws. Fig. 1 is a good illustration of this method of chucking.

Should you wish to locate second operation work from an external diameter,

Photographs show actual applications of the Coventry Chuck, and are reproduced through courtesy of Alfred Herbert Ltd.

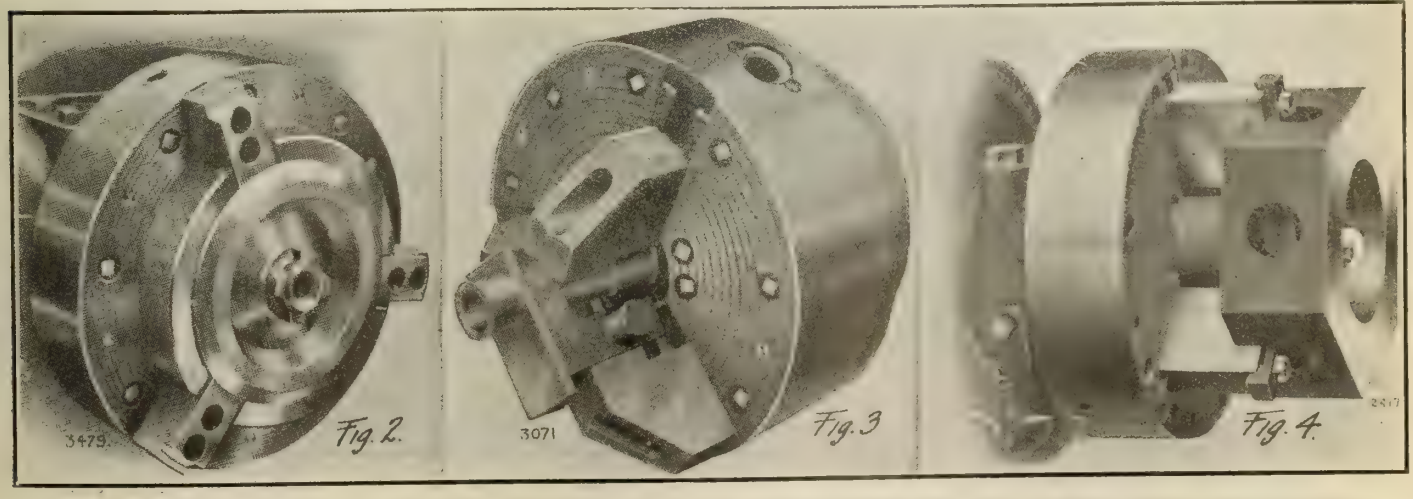

Fig. 2—Use of exterior locating ring. Fig. 3—Peculiar shaped stamping held by special jaws. Fig. 4—Holding hexagon turret by means of jaws and auxiliary clamps.

finished at the first operation, you can adopt the method shown at Fig. 2. In this case the part, a motor-cycle flywheel, is located in an adapter plate bolted to the regular chuck face. Note that the adapter plate has three slots cut in it, these admitting the soft chuck jaws. Thus, true concentricity is secured, for the jaws merely do the gripping, the adapter plate assuring proper location.

Fig. 3 shows a peculiar shaped stamping held by means of special jaws on the regular chuck. Two of these grip on the round boss, while the other is flattened to grip on the offset lug. Ask some men to hold such a piece in the chuck and they would say, "It can't be done," and yet the solution is very simple, as the illustration shows.

In Fig. 4, we have a combination of ideas. The hexagon turret being held has to be bored and faced, and the jaws are designed to grip on the boss, but in addition, clamps are provided, which draw back the work securely against the jaws, thus making the holding all the more accurate and secure.

Contrary to popular opinion, it is not necessary to use a four jaw chuck to grip square objects such as shown at Fig. 5. Here we see a special set of jaws holding a pipe flange quickly and accurately. Note that one standard style jaw grips on a corner of the flange, while other two jaws having straight faces, complete the set.

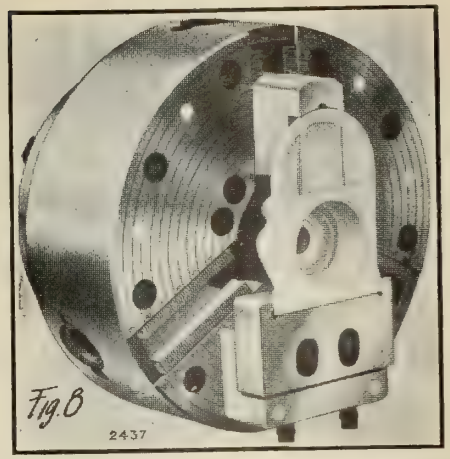

Fig. 8—Using the one-jaw method of holding.

The next example, Fig. 6, shows the holding of a bevel gear, in which the teeth are cast. During the boring and facing operations it is necessary to grip on the cast teeth in order that they may eventually be true with the bore. To ensure this, soft jaw blanks were suitably formed to suit the gear, and then case hardened.

Irregular Work

Fig. 7 shows how the standard reversible jaws on the chuck we are speaking of can be applied to irregular shaped work. The part depicted is a gas engine cam, this being gripped as quickly and easily as any circular object after the jaws have once been set carefully.

Fig. 8 shows a peculiar chucking application but one which has been very successful. This is known as the one-jaw method, and the part, a magnet end shield, is clamped by a single jaw against an adjustable locating block bolted to the face of the chuck, the two ordinary jaws being removed. In numerous cases this method of holding is more satisfactory than the usual two-jaw system.

Another good example of the one-jaw method is shown at Fig. 9. The part is an aero engine carburetor body made from an aluminum casting. In the operation shown, the jaw grips over the solid metal at the bottom of the hole, thus avoiding distortion, yet getting ideal gripping power.

Fig. 10 shows a drop forging of a roller steady box tool. The machinery operations consist of drilling and boring the boss for the overhead bar. Note that one jaw grips the boss, while the second, which is of vee block form, engages the corner below the back carrier. The third jaw grips the part behind the vertical adjusting screw boss.

While it is not good practice to have the chuck jaws overhang too much, the application shown at Fig. 11 is quite permissible because the machinery operation in this case is not very heavy. The special jaws shown were designed to

(Continued on page 53)

Rust Imposes Severe Tax on Steel Products

How Ferrous Base Metals Affect Galvanized Coatings—Value of Commercially Pure Iron—It Resists Corrosive Influences—Results of Seven Test Conditions—No Deterioration

By D. M. STRICKLAND

THE preservation of iron and steel installations is a most important economic problem. Every time the material of longest life is chosen for actual service requirements, such action is a step toward the conservation of our national resources.

The rust tax is a severe tax and extensive users of iron and steel products realize that bare, uncoated ferrous metal sheets should never be exposed to conditions of service when it is possible to prolong the service life of these sheets by the external application of a protective coating.

One of the most efficient of the protective coatings in use to-day is spelter. It is not to be expected, however, that it is possible to render poor grade sheets serviceable by simply covering up the manufacturing blemishes with a spelter coating. Such a procedure would indeed be far from conservation practices. The base metal must be chosen with exacting care. It should be thoroughly deoxidized and degasified, and be of the highest possible quality in every detail.

A base metal which has proved most satisfactory in these essential requirements is commercially pure iron. There are several reasons for this which will immediately appeal to the research investigators. In the first place, considering mechanical advantages, the commercially pure iron sheet (uniform in density and softness) is admirably qualified to take on a tight adhering zinc coating, one which does not peel, a coating which we have found withstands corrugating, culvert forming and sheet working in general. This is true when the spelter is present up to as high as three ounces per square foot.

Again, the purer the iron, the purer the coating. This is due to the fact that pure iron has less alloying tendency toward zinc than has steel. This point is clearly demonstrated by tests described by W. T. Flanders in Galvanizing and Tinning. Mr. Flanders shows that impure iron and steel dissolve in molten zinc much faster (from three to seven times) than does commercially pure iron, and he furthermore recommends that commercially pure iron be used as equipment for hot-dip galvanizing plants.

Further substantiating evidence can be obtained by determining the iron content carried by the coating after application. Many spelter coating analyses as determined during the past eight years have been averaged with the following results, averages being compiled from results obtained from over 500 different galvanized specimens:

Material	Percentage of iron in Coating
Commercially pure iron	3.92
Impure coppered iron	4.89
Common steel	5.91
Coppered steel	4.55

These figures show that the iron content of the galvanized coating in grades other than commercially pure iron is from 16 to 50 per cent. higher than for the purer coating. Such averages, covering as they do so long a period of time, clearly substantiate the foregoing statement that the purer the iron, the purer the coating.

The purer coating has a decided advantage over the impure galvanizing from the standpoint of electrolytic corrosion. The difference in potential between commercially pure iron and its coating is less than the electro-potential difference between spelter coating and a base metal of impure iron or steel. This is true because coppered steels are more electro-negative to zinc than is commercially pure iron, the coppered metals themselves being electro-negative to the iron. Interesting results are obtained when a galvanized specimen of commercially pure iron has its coating stripped from two-thirds of its exposed surface and the entire sample is immersed in a 3½ per cent. solution of sea salt. The unprotected iron surface will remain bright and uncorroded. The zincked portion of the sample (although only one-third of the total surfaced area) protects the exposed iron and continues to do so while the zinc withstands the corrosive action of the salt solution. Galvanized coppered-steel specimens of equal size and carrying approximately the same weight of coating when subjected to identical test conditions showed that the unprotected steel remained bright 61 per cent. as long as the commercially pure iron.

The tabulations herewith typify the results that are obtained when tests are conducted for the purpose of determin-

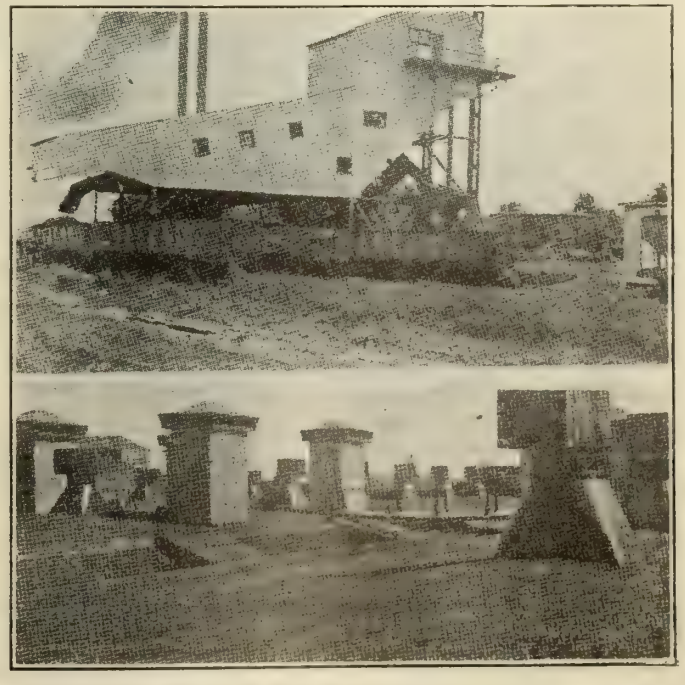
Galvanized iron culvert in as good condition as when first installed ten years ago.



Pure iron used in coal chutes and ventilators in use for 13 years, reveal no evidences of corrosion.

Keeping Track of Costs in the Small Shop

Successful System for Light Manufacturing—Recording Work of Skilled and Unskilled Labour—Planning the Details—Following the Product Through the Plant—Simple Card System

By G. BLAKE

THIS subject of cost-keeping is one which has interested the writer very much, especially in its application to the small shop. A system may prove very effective in large establishments employing from 500 to 10,000, but it may not be at all applicable to the small shop. Yet it must not be inferred that, because a system which has been successful in a large shop does not work, the smaller shop can do without a manufacturing system; it is as necessary for the shop with a pay-roll of 25 and upwards as it is for the larger establishments. Of course, the author has taken it for granted that the small factory has a specialty of some description; it may be lathes, bakery machinery, electrical apparatus, or motor car accessories; at any rate, it will be assumed that the small shop in this particular case does manufacture a specialty. Take, for example, electric control gear, which is made up largely of brass, copper and cast iron. Other materials are used, but not to the same extent as the three named. A great deal of both the machining and assembling is performed by specialized labor, either male or female; skilled labor is not required except in the tool room, inspection, final assembly and testing departments. It is generally accepted that, in using specialized labor, a greater degree of attention is required from the charge hand or foreman, both in the training and supervision of such labor. Where instructions have to be given great care must be exercised in the giving of details which, to a skilled mechanic, would not be necessary.

Effective System

In a small factory the following manufacturing system was introduced with very successful results. Prior to its inauguration every one in the works did his best individually, but without any systematic effort. For instance, the setting of processes and piece-work rates was in the hands of the foreman who, though an excellent fellow, had not much idea of running a small shop for the economic production of the firm's specialty; things just ran along haphazard. If the bench hands required any parts from the machine shop (there being no finished stores) they simply came across to the machine engaged on the parts they needed, took away with them enough to last for a day or more and, if the parts did not fit, they altered something to suit. This, of course, led to all sorts of trouble, especially when asked to supply spare parts after the apparatus had been in use some time.

Organizing the Works

An engineer was engaged to organize the works and install modern methods. The first change brought about was in the planning of the work; manufacturing processes and times were fixed, jigs, tools and gauges were designed, and works instruction sheets were made out as Fig. 1. As will be noted from the sheet shown, all tools, jigs, fixtures and gauges were specified and tabulated under their letter and number. For example, all jigs and fixtures were put under J with numbers from 1 to 1,000, all tools were under T, and gauges under G. The machine shop charge hand was notified by the shop superintendent that there was an order for same, 500 machines, comprising 150 parts machine. He would then go to the shop clerk and ask him for an order form (Fig. 2 illustrates the type used). On the front side A of the order card all particulars relating to the job were entered by the shop clerk, such as S/o No., Part No., Drg. No., description, quantity required and material, with the space at the bottom for a date when the order was issued and one for the date when the order was completed.

The reverse side B of the card was arranged as a progress card for the job, and by looking over the cards the shop clerk would readily furnish the production engineer with information as to the position of any component, number of components, or finished units or machines. For example, taking the sample card shown, and supposing that there were 150 parts in a complete machine, an order card would be made out by the shop clerk for each part and given out to the machine shop as required. In connection with the assembly and sub-assemblies, a card would be made out to cover each, one for sub-assemblies of contacts, oil dash pots, etc., and another for final assembly. When a part or complete machine was finished the card was returned to the shop clerk duly signed.

Returning to the machining of components, the work was inspected after each operation. The inspector would enter in the space provided the quantity passed and initial the card for that particular operation. It would then be ready for the next operation, the quantity after

each operation being easily seen and noted.

Obtaining Material

Again, returning to the commencement of a job, after the charge hand had obtained the order card he would next obtain the blue print and works instruction sheet, then he would present the order card at the rough stores so that the material could be obtained. No materials were given out unless an order card was presented. A sample store stock card is shown in Fig. 3. This card was double-sided so that both sides could be utilized. Then, the charge hand would apply at the tool store for the tools, jigs, gauges, etc., as specified on the works instruction sheet, it being so arranged that where possible all jigs and tools, etc., belonging to the job were kept together in a small box or bin with a sample piece so that the charge hand could set up the job on the machine, and then test the work from the sample before putting the operator on the job.

Grinding Tools

In connection with the grinding of twist drills, etc., it was arranged that an experienced driller was put in charge of the boys on the drilling machines, and he was responsible for all the grinding of twist drills. During the rest of his time he would personally do all the important drilling. By this means the drill bill was reduced very considerably as, previous to this, the boys ground their own drills, entailing a great loss of time (boys will talk round the emery wheel) as they could not appreciate the difference between grinding a drill for steel and one for cast iron or brass; consequently, drills did not last long, as they were not properly ground and in addition the drilling times were high. The same applied to the capstan department. No operator was permitted to grind his own tools; the charge hand had to see to the tool grinding.

In connection with the inspection of the work, a smart bench hand was trained to undertake this duty, and all work was inspected before being forwarded to the finished parts stores. A section of the main store was portioned off for this purpose. Bench hands, etc., requiring parts for their job had to have a requisition note (Fig. 4) from their charge hand calling for a quantity of the components. By this method no work was allowed to be taken away from the machines by the bench hands or any other individuals.

In the tool room a tool fitter was appointed to perodically inspect and adjust all working and inspection gauges, the tool store being incorporated in the tool room. All new jigs, fixtures, tools and gauges were personally inspected and tried out by the writer before being put in the tool store. Standardization in the tool room was carried out as far as possible; gap gauges were made in blanks from case-hardened mild steel, and when a gauge was required the order to the tool room simply specified blank No. 1, 2 or 3, whichever size was nearest to the finished dimensions of the gauge. Regarding the heat treatment of tools, etc., many carbon steel tools had been ruined previously through overheating. A piece of ½ in. dia. cast steel was magnetized at one end and was made sufficiently long to be held by the hand and to go in the furnace to test whether the tool in the fire was at its correct hardening temperature. As is well known, carbon steel when at the correct hardening temperature has no affinity for the magnet. The tool fitters were instructed in this method for gauging the hardening temperature, with very good results.

Responsible Tool Fitters

A word about the tool fitters; they were smart bench hands taken from the assembly bench, and by careful training these men in time became quite proficient tool fitters, and results amply justified the time taken in special instruction and training. Two of the most promising apprentices were selected for the tool room; each had a year in the production engineer's office on jig and tool drawing. As the boys selected were very keen and had a good technical education, they both proved good draughtsmen and worked out all jigs, tools, fixtures, gauges, etc., from freehand sketches. It not only created desire on the part of the boys themselves, but it acted as an incentive to all the rest of the boys in the works to qualify for jig and tool drawing and tool room work. No expensive jig and tool designers were required, as the production engineer designed all the jigs, tools, etc., and the boy in the office did the drawings to scale in detail. This procedure could be profitable adopted in most small shops.

A jig, tool and gauge record book, as illustrated in Fig. 5, was kept in the

production engineer's office, and all tools, jigs, fixtures and gauges were recorded under their respective letters, i.e., T, 1 to 1,000 for tools; J, 1 to 1,000 for jigs and fixtures; G, 1 to 1,000 for gauges. This book was kept for reference purposes. As shown in the sample page, all particulars regarding the tool or jig, etc., were recorded. A card index system would answer equally well. A plan of the whole works was made, showing the position of each machine, bench, etc. A small flag attached to a pin with the worker's name written thereon and stuck on the plan (which was mounted on a board and hung up in the office) indicated at a glance the position of each employee in the works. When running a night shift the flags were duplicated in the case of a machine or bench being double-shifted, the day worker's name in black ink and the night worker's name in red ink. Capacity charts for every machine were got out, so that it was not necessary to measure up any machine to see if the job could be accommodated on it. All this information was tabulated and put away for future reference in connection with work planning. On these charts or machine capacity cards the name of the machine, type, maker's inspection number, number of machine in works, together with the date on which it was bought, and whether new or secondhand. Fig. 6 illustrates the chart.

An inspection record book (Fig. 7) was kept by the inspector in which were entered all parts inspected and passed, together with the S/o No., Drg. No., Part No., operation, etc. (sample page shown). It will be noted that there is a column for scrap work. This proved very useful to the production engineer, as it showed the amount of scrap in every job from day to day, and enabled him to take up the matter with the charge hand concerned.

Setting Piece-work Rates

In connection with the setting of piece-work rates, all piece-work rates were fixed before a job was sent into the works by the production engineer. A book with pages in duplicate was used for keeping piece-work records. Fig. 8 shows the type of book. One of the pages was kept by the production engineer for future reference and the other page was forwarded to the office for costing purposes.

Material identification card.

Identification Card

Fig. 9 illustrates an identification card used in the rough stores, so that all materials could be easily identified. A master card measuring 24 in. by 15 in. was got out and hung in the stores near the raw material so that the storekeeper's assistant could classify all materials. The bars and rods were painted their respective colors, so that it was impossible for any one to make a mistake. Where no color scheme is in operation it not infrequently happens that a whole batch of work is ruined in the heat treatment department owing to the hardener treating the steel wrongly, as high-speed steel had been specified and the stores, without knowing it, had given out cast steel. This card is very effective in, say, a motor car factory where there are so many kinds of steel used. The same remarks apply to the various kinds of non-ferrous metals.

The system depicted in the foregoing article is not only applicable to the small shop, but can be applied to larger. Its chief advantages are its simplicity, economy and efficiency.

RUST IMPOSES SEVERE TAX

(Continued from page 33)

ing the comparative resistiveness of pure and impure coatings. The object of this test was to observe the action of dilute acids on galvanized samples.

Different grades of galvanized materials were used in the investigation. Samples, 16-gauge, 2x2 in., after cleaning and weighing were vertically placed in separate tumblers and completely immersed, using 300 cc of very weak acid (N/100) for each specimen. The acids used were sulphuric, nitric, acetic, tannic and hydrochloric. The test was run in duplicate at 100 deg. C.

In order to guard against exhaustion of solution strength, each test piece was removed from the acid at the end of 24 hours and immersed in 300 cc of fresh acid. At the end of 45 days the test was discontinued and weight losses recorded.

The test was amplified by conducting at the same time a similar test at room temperature.

These results verify the claims that the purer coating is more resistant to corrosive influences and has a longer service life than coatings contaminated with higher iron percentages.

Other Tests Bear Out Conclusions

The foregoing is but one of a large number of investigations. The influence of the base metal on the galvanized coating was investigated by observing tests where different grades of full-size sheets, fence wires, culverts, gutter and drain pipes, shingles, tanks, laboratory specimens, etc., were subjected to a large number of test conditions, such as atmospheric, soil, river waters, drainage, still water laboratory tests, aerated immersion tests, coal mine installations, etc. In fact, many and diversified corrosion tests have been conducted using commercially pure iron in comparison with galvanized samples of impure iron and steel, and the results obtained show without exception that the purer coating on this material is always found to be the most lasting.

The following is a tabulation of the analyses of the base metals followed by a report of the results obtained:

Material	Sul.	Ph.	os.	Carb.	Mang.	Cop.
Commercially pure iron	.020	.006	.010	.018	.020	
Coppered iron	.062	.023	.014	.021	.230	
Coppered steel	.074	.091	.110	.410	.200	

PERCENTAGE LOSS OF GALVANIZED COATING

Material	Sulphuric Acid		Nitric Acid		Acetic Acid	
	Boil. Temp.	Room Temp.	Boil. Temp.	Room Temp.	Boil. Temp.	Room Temp.
	%	%	%	%	%	%
Com. pure iron	85	73	23	21	79	51
Coppered iron	95	90	36	26	100	82
Coppered steel	100	93	38	25	100	82

Material	Tannic Acid		Hydrochloric Acid	
	Boiling Temp.	Room Temp	Boiling Temp	Room Temp
	Per Ct.	Per Ct.	Per Ct	Per Ct
Com. pure iron	10	5	78	54
Coppered iron	15	11	100	88
Coppered steel	12	10	100	84

In addition to the valuable laboratory tests showing, as they do, the greater resistivity of the pure spelter coating, hundreds of actual service installations have been under observation which yield data of a most convincing character.

Conclusions which are drawn from the normal service life of galvanized ferrous metals when subjected to every-day commercial requirements are the final criteria to be considered when establishing the value of the commercially pure iron base metal.

Individual service records of the thousands of installations during the past 14 years, taken in part or whole, show the value of commercially pure iron as the base metal for galvanized sheet metal requirements. The results of so large and varied a number of laboratory tests simulating so many conditions of actual service; the valuable information from commercial installation; the purity of the zinc coating and the protection it affords even when part of the base metal is exposed; the superior corrosion resistance of galvanized specimens when the electro-potential between the base metal and coating is at a minimum; smoothness, purity, deoxidation — all these points, singly or as a whole, would seem to give an undoubted advantage to commercially pure iron as a satisfactory base metal for galvanized installations.

It is not good practice to use wire lacing in a belt that is to be shifted by hand.

?? Questions and Answers ??

CLEANING CASTINGS

Question:—We would be pleased to have you advise us what pickling process would be best for removing sand and cleaning grey iron castings.—W. H. C., Montreal.

Answer:—One of the most common methods of removing sand from castings is to soak them over night in a solution of one part sulphuric acid (oil of vitriol) and 4 parts water. This is to be kept in a wooden vat, painted on the inside with white lead. If the solution is kept boiling by having steam pipes running through it, several batches can be pickled during a day. This solution is only good where the scale is soft enough to be penetrated by the acid, which attacks the surface of the iron, leaving the scale loose so that it can be washed or brushed off.

If the sand is burned right into the metal there is only one acid which will remove it. Hydrofluoric acid will eat sand, and if kept in a glass retainer, will dissolve the glass, but it will not attack iron, neither will it affect wood, so a wooden vat constitutes the entire equipment. If the castings are immersed for two or three hours in one part of hydrofluoric acid and ten parts of water, the metal will be freed from sand as well as the hard magnetic oxide (scale). This solution is equally as effective on forgings, and is by all means the best method known.

CARRYING MINING SUPPLIES

Question.—Can you inform me as to the advisability of establishing a stock warehouse in the north country in order to serve the gold and silver mines with necessary supplies or equipment? What would you consider the initial step in establishing a contact with that field?—C. J. E., Belleville.

Answer.—There is, undoubtedly, a definite market in the north for all kinds of material entering into mining processes. Whether it would be advisable to establish a warehouse at Cobalt or other northern centre, rather than at Toronto or Montreal, would depend upon a personal trip of observation to learn what the actual requirements are. This, too, would be one of the first steps necessary in establishing contact with the market. It is estimated that the value of material and equipment used by the mines of the north runs well over 30 millions. It seems to be a field worth cultivating. Foundries have already found it to be a profitable market for heavy castings, steel crusher balls and repairs. There is an increasing demand for ball and tube mills, crushers, stamp batteries, grinding machinery, electrical equipment, high-speed steel, rock drills, pumps, fittings and high pressure pumps. Hoisting equipment, so largely used, calls for wire rope or cable, steam shovels for surface work and trenching, steel rails from 12 to 33 lbs., and other railroad accessories together with switches, turntables, cars, etc. Good business is being done in pumps, pumping equipment such as reducing and globe valves, steam boilers and engines and many other accessories and materials used in extraction of precious metals by chlorination or cyanide processes.

Canadian Machinery and Manufacturing News would have its readers feel that its resources for gathering special information, such as they may require, are freely at their service. Their questions will receive immediate consideration. On the other hand, should they feel that they are in a position to add to the information given in these columns upon any subject, their co-operation will be greatly appreciated. Desired information is first sent by mail to enquirers. Names will be supplied upon request.

C. I. F. CONTRACTS

Question.—Will you please tell me what is generally included in the terms C. I. F. as applied to a shipping order or a contract? Does it embody all charges to point of final delivery?—Exporter, Toronto.

Answer.—This term, broadly speaking generally signifies charges, insurance, freight paid. Responsibility of each party to the contract is recently described by a writer in the trade supplement of the London Times. The seller is required to:—

1. Put the goods free on board (F. O. B.) and pay all transportation to the agreed destination.

2. Be responsible for all loss and for damage until delivery of the goods into the custody of the shipowner:

3. Take out and pay for all necessary marine insurance.

4. Deliver to the buyer or his agent a clean bill of lading to the agreed destination and a marine insurance policy or negotiable insurance certificate.

The buyer on his part is expected especially to:—

1. Be responsible for loss and for damage thereafter and to make all claims to which he is entitled under insurance.

2. Take delivery and pay costs of discharge, lighterage and landing at port of discharge in accordance with the bill of lading clauses.

3. Pay all import duties, customs and wharfage charges, if any.

Above terms generally apply to sales made on C. I. F. basis, but the terms are sometimes modified by special clauses in contracts of sale.

THREADING DIES

Question:—Is there any rule for finding the approximate weight of square and round steel bars when the side or diameter and length are known—without resorting to weighing?

Answer:—It is possible to figure quite closely by calculating the volume of the bar in cubic feet and multiplying the result by 489.6, the weight of one cubic foot of steel. Another method is by figuring direct by dividing the product of the square of four times the diameter by 6, for round bars, and by 4.7 for square bars. This gives the weight per foot of running length. Suppose we have a round bar 7 in. dia. and 10 ft., long, the weight would be:—

$$\frac{(4D)^2}{6} \times 10 = \frac{28 \times 28}{6} \times 10 = 1306.6 \text{ lbs.}$$

For a square bar 7 in. on a side, the weight would be for the same length:—

$$\frac{(4D)^2}{4.7} \times 10 = \frac{28 \times 28}{4.7} \times 10 = 1668 \text{ lbs.}$$

WEIGHT OF STEEL BARS

Question:—We have a set of collapsing dies which appear to be in first-class condition but frequently we are troubled with flats at the root of the thread. What would cause this condition? E. J.

Answer:—While it would be difficult to give a definite remedy for this trouble without knowing the kind of metal on which the threads are cut, it would seem that the dies are not properly ground. The flattening at the root of the thread is likely caused by some of the dies cutting in advance or later than the others. Assuming that the dies are of the milled type, we would suggest testing the dies on a trial piece of stock, stopping them in the process of cutting and closely examining the various dies for accuracy of position and chamfer. All the cutting should be done on the chamfer, and not back on the full thread. If the dies do show cutting on front or back side of the teeth, they should be stoned slightly on the edge that is doing the shaving. Should this trouble continue it would be well to take the matter up with the makers of the dies, giving all detail particulars.

Effective Method of Carburizing Local Areas

Numerous Ways of Protecting Metal From Exposure to Carbon Carrying Gases—Drying the Parts Before Packing—Preventing Carburizing Action by Copper Plating—Removing Grease

THE ABILITY to carburize only those areas which are to be increased in carbon content and are desired hard, leaving the remainder soft, is one of the most valuable assets of the user of the carburizing process. Such methods are invaluable for ball bearings where a deep backing of soft metal is desired for strength and toughness while the race itself is extremely hard; for carburizing delicate parts where production methods preclude separate handling in the hardening operation; to keep from heating and quenching the shanks; for delicate tools or gauges where the thin metal would carburize clear through and be brittle; for work which distorts in hardening and for the reshaping of which machining or bending is necessary, such as arbors, shafts, gears, cam shafts, etc.

Sections of parts carburized which are to be kept free from an increase in carbon may be covered with fire clay mixed with water to the consistency of putty, dried by moderately slow heat and packed in the pots with carburizer in the ordinary manner. Drying before packing is usually necessary as the water in the fire clay when exposed to the high heat of the carburizing furnace will cause the fire clay to crack. The carburizing gases will enter the fissures thus made and cause partial carburization. Salt is often mixed with the fire clay to lower its fusing temperature and act as a binder. After carburizing in the usual manner, the clay would be knocked off, and the work treated as any carburized work in the hardening operation. This method is successful for the small shops where the demand for local carburizing is not great.

Protecting Sleeve

The metal protecting sleeve is especially practical where the form of the work permits its use. The method here is to have a sleeve or collar that can be slipped over the part required to be left unhardened. This sleeve is either a push fit or, if loose, can be wired in place. Too much looseness between the sleeve and the work will allow the carburizing gases to enter. This may be avoided by daubing a thin mixture of fire clay on the inside of the sleeve before putting it in place. After carburizing, the work may be hardened in the regular way with either the sleeve left on or removed. Leaving the sleeve on insures softness of the part covered, but if the sleeve fits too tightly trouble may be experienced in its subsequent removal. The sleeve can be made of iron or steel. It can be made in sections, for ease of applying, in which case the sections may be wired together with fire clay at the joints. Asbestos paper is often used as a wrapping for the section desired free from an increase in carbon.

Other Methods

Sand can also be used as a mask by placing it at the bottom of the pot and imbedding the section of the work desired free from an increase in carbon in it, the section to be carburized extending above it and surrounded with carburizing material in the regular way. This method is usually not to be desired, as the sand becomes mired with the carburizing material, and with the iron scale which accumulates from the pots, will eventually form glass or silicate deposits on the work. A thin paste of water glass (sodium silicate) and Kaolin (a fine grade of clay which can be purchased at any drug house) is oftentimes painted on sections of the work desired free from an increase in carbon. The mixture is dried on the work in the air and is packed in the pots in the regular way.

The above methods are more efficient for light than deep carburization. The skill of the operator in applying them affects the final results. For greater depths, the long heat eventually breaks them down and penetration of carbon will be experienced. The use of the sand method is probably the only exception, but, as explained, it has other objections. By leaving sufficient extra metal on sections desired to be soft after hardening, and, after carburizing, machining off this excess metal, these sections are with certainty prevented from hardening on the quench. It is evident that, while this is a very sure method, there will be more time used and considerable cost, which however, may often be more than offset by its advantages.

Copper Plating Method

The most satisfactory method so far found, where the volume of work warrants it, is the copper plating method. As everyone knows, it is impossible to harden copper by heat treatment. Carbon is the chief hardening element in metals and there is no affinity between copper and iron nor copper and carbon. The copper plating process referred to is

This shows the various conditions of case and core under different heat treatments. Beginning at the top left is the original steel. No. 2 is carburized at 1650 deg. F., quenched from the pot in oil. No. 3 is re-heated at 1650 deg. F. and quenched in oil. No. 4 is carburized at 1650 deg. F., quenched from the pot in oil, re-heated to 1425 deg. F. and quenched in water. No. 5 is carburized at 1650 deg. F., cooled in the pot. No. 6 is carburized at 1610 deg. F., cooled in the pot, re-heated at 1650 deg. F., quenched in oil, re-heated at 1425 deg. F. and quenched in water. No. 7 is carburized at 1650 deg. F., cooled in the pot, re-heated at 1425 deg. F. and quenched in water.

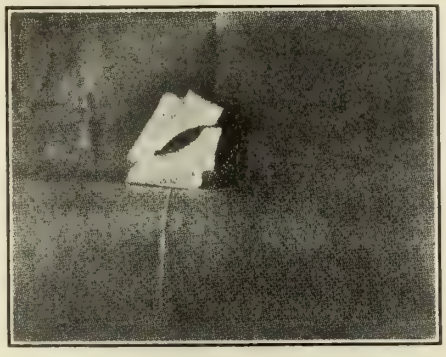
As recommended by the American Gear Manufacturers Association.

the electro-plating process. Simply applying copper sulphate, etc., is not satisfactory inasmuch as there is no bond between the steel and the copper coating. This coating will peel off under certain conditions, which may be a too heavy copper coating, lack of density, or difference of expansion. The copper electroplating process consists in chemically cleaning the work, copper electroplating it and removing mechanically the copper at the parts desired to be increased in carbon. This method of mechanically removing the copper calls also for removing some of the steel so that it is necessary to have a sufficient allowance of metal to be removed. This mechanical removing of copper is done by grinding or by machining. The former is in no way satisfactory as minute particles of copper are rubbed in and imbedded in the surface desired hard, by the wheel giving to the hardened finished surface a semi-softness that is often puzzling as well as serious, and sometimes the carburizer is unfairly blamed. In order to avoid mechanically removing the copper, japanning of the surface desired to be carburized is resorted to before copper-plating. After baking the japan the whole is plated. The japan burns off in the carburizing process and the steel formerly covered by the japan is carburized. The following method is practised by one of the largest concerns doing local carburizing and protecting their work by electro-copper plating .

Cleaning the Surface

The grease is first removed from the work by cleaning in sal soda or gasoline, according to the amount of grease present. The work is then thoroughly cleaned, before japanning, by washing successively in potash, hydrochloric acid pickle, cold water, potash, cyanide solution, cold water and hot water. The work is japanned with two coats, being baked at 400 deg. F. after each coat. The same routine of washing is gone through as before but omitting the hot water. Then the work is plated in the cyanide copper solution for 10 to 15 seconds, or until a copper color is barely obtained. This solution should only be lukewarm and used at 5 volts. Formula is 50 gallons of water, 25 pounds copper carbonate and 50 pounds cyanide of potassium (or enough to bring carbonate into solution). This solution should be kept 8 to 10 deg. Baume gravity. Next the work is thoroughly rinsed in cold water and transferred to a nickel plate bath, run with about 3 volts and scant anode surface. Bath should not be too hot. Plate 10 to 15 minutes to give good foundation. Rinse work thoroughly in cold water and transfer to acid copper solution, cold at 5 volts. Plate 20 to 30 minutes. Formula is 50 gallons water, add copper sulphate to give 18 deg. Be. solution, and then sulphuric acid to 20-22 deg. Be. Keep acidity and gravity correct. Wash in cold and then hot water and dry.

The ability of the plate to resist action of carburizing materials depends not upon thickness, .001 in.-.0015 in. is sufficient for any purpose, but on foundation and density. The cleaning before and after japanning, keeping the solution cool enough, and the density of the plate, are the important factors. The nickel plate might be omitted in some cases, but it eliminates a long time in the cyanide-copper solution and the consequent action of the same on the japan and steel. It also gives a good foundation which is resistant to the action of



Carburized ball-bearing. This shows that only the raceways have been carburized. The carbon has been kept out of other portions by copper plating. This is a 50-hour heat. For such deep carburizing, care must be used in selecting the carburized material.

the acid copper solution. It is found that, as a regular proposition, the nickel foundation is most satisfactory. The method of plating described is used for work requiring deep penetration of carbon and is very satisfactory even for over a hundred hours of carburizing.

It is understood that with certain carburizers with active chemical energizers the copper plate has a tendency to break down. For gear work, however, any of the commercial carburizers are satisfactory, as break-down of copper in pinhead spots is of no consequence. If, however, occasion demands absolute freedom from copper break-down, charred bone, charred bone and charcoal, or hydro-carborated bone black carburizers are recommended. For gear work, japanning is not always necessary as the copper plate may be applied before the teeth are shaped. The removing of the metal will then lay bare just the part that is desired to carburize.

Protective Coating

Recent developments in France in selective case-hardening employ a protective coating applied with a brush in a paste or semi-liquid form. This mixture is composed principally of powdered copper with an inner material and a binder. The formula recommended is powdered copper two parts by weight, powdered emery one part by weight, commercial solution of silicate of soda in sufficient quantity to give a thick paint. This formula was arrived at after long experimenting and many tests. Aluminum in powdered form and many other materials were tried with little or no success. The coating obtained with the above mixture is very adherent before heating and is easily removed from the steel after case-hardening. The best method of preparing paint is to mix the powdered copper and emery before use, and just before applying to the steel add the necessary amount of silicate of soda to give the desired consistency. The silicate is added little by little so as to make first a thick paste and then is brought to the necessary fluidity to flow freely from the brush.

The previous removal of grease from the steel is important. Experience has shown that the paste will only protect properly if the parts are perfectly free from grease. Removing grease with a bath of hot potash solution is altogether insufficient, the mineral oils being only partially or not at all emulsified. The simplest and most efficient method of removing grease seems to be to heat the work in a furnace to about 900 deg. F., avoiding in all cases red heat. A coating is required of about one-half or equal the thickness of the case against which it is to protect the steel. Drying takes about fifteen minutes and the pieces may be packed in the boxes one hour later.

CATALOGUE

The Canadian Ingersoll-Rand Co., Sherbrooke, Que., have just issued a new bulletin, K-3111, illustrating and describing their new class "ER"-1 single-stage, straight-line, belt-drive, air or gas compressors. These new machines are produced in their entirety at the Sherbrooke plant and embody all of the latest developments in compressor engineering. These include "Ingersoll-Rand" plate inlet and discharge valves; enclosed construction with automatic combined flood and splash lubrication at all speeds; forged-steel connecting rod and crankshaft; removable die-cast bearing shells, etc. The plate valve adopted for these machines is a modified form of the valve used for several years on their largest compressors. An outstanding advantage of the valve is that it requires no lubrication or mechanical valve gear and is supported throughout its entire operation in perfect alignment without any form of wearing guide. Regulation of the class ER-1 compressor is accomplished either by an automatic inlet unloader or by a "free air unloader" operating directly on the inlet valves. Bulletin K-311 presents an interesting comparison of the various types of compressor drives and contains other information of value to compressor users. The class ER-1 compressor is as nearly automatic as any machine of this kind can be and is particularly adapted to small mines, quarries, foundries, machine shops, textile or paper mills and industrial plants generally. Copy may be secured on request.

Brightening Up Interiors of Industrial Plants

Workmen Influenced by Shop Conditions—Well Lighted Factory Raises Morale of Employee—Effective Reflection of Available Light—White Painted Walls a Means of Protection

MANUFACTURERS are rapidly realizing the economic value attached to the practical solution of the artificial lighting of factory interiors. There are so many factors involved in the problem of present-day production that no executive can afford to overlook even the smallest one if he desires to meet the competition that makes it necessary to consider every phase of plant operation while endeavoring to produce on a paying basis. Workmen are engaged to perform certain duties and anything that detracts from the efficient accomplishment of these duties, naturally utilizes a certain percentage of energy that might well be applied to a more useful purpose.

Proper Diffusion of Light

Economic illumination is not so much a question of providing sufficient candle-power but rather the scientific distribution of the light available. This includes both the natural daylight and artificial lighting facilities. To utilize fully the daylight coming into a factory through the windows and skylight, or the illumination transmitted from electric lights—no matter how systematically these units may be situated—the question of proper reflection is of vital importance. This problem of light diffusion is best solved by coating walls, pillars, and other reflecting surfaces with a paint having the necessary qualities. It has been found that by finishing the interior walls of a plant in white, with a special line of paint developed for this purpose, that not only the lighting bill has been reduced, but fewer accidents resulted, and that the morale of the workers was greatly increased; also that cleanliness and sanitation were greatly promoted. In addition to this, production was much larger, due to the decrease in the number of spoilt jobs.

It is generally admitted that clean, white walls are an aid to industrial efficiency and an economic necessity. They eliminate the dark corners and minimize the shadows, thus reducing the possibility of accident, and increasing the confidence and goodwill of the workmen. In dark and dingy factories production is invariably below the possible capacity of its equipment and operators. Much of this loss through inefficiency is directly chargeable to poor lighting. Shop atmosphere has much to do with human temperament. Clean, well-lighted sanitary factories have an appeal to that type of worker who is a special asset to any organization.

Influence on the Worker

Factory executives are more or less agreed on the beneficial results arising from a well-lighted and sanitary workshop. The collective efficiency of any body of men may be said to be directly proportionate to the conditions under which they work. A dark, disorderly and unsanitary factory will naturally develop a spirit of depression in the mental and physical attitude of nearly every employee. Much of their energy is required in guarding themselves against the risks and dangers that invariably lurk in shops where inadequate lighting creates extreme shadows, and where particular care must be exercised by passing employees to avoid the hazard that is generally associated in places of this nature.

Poor Lighting Causes Eyestrain

One of the most objectionable features in connection with poorly lighted plants, especially during the winter months when the hours of natural utilization of daylight are comparatively few, is the detrimental effect upon the eyesight. In plants where proper attention to effective lighting has been overlooked the tendency has too often been to provide excessive illumination at points where it was deemed most necessary. This condition, which in the past may have been considered good practice, would now be classed as inefficient and uneconomical. For instance, suppose a strong light is located over a machine and directed on the spot where the work is actually being performed. Should the general lighting arrangements be such as to leave the rest of the machine and adjoining floor space in comparative darkness, the strain on the worker's eyesight when turning from the strong light to surrounding shadows would eventually develop fatigue and affect his ability to maintain effective production after a definite period, depending on his constitution and experience.

Specific Instance

The writer has in mind an instance where he was employed in a large engineering plant in the States some years ago, working on the night shift. Each individual machine was supplied one or

News From the Welding Field

Safe Practice in Handling Acetylene Generators

Best Housing Methods Under Different Conditions—Fire Hazard Requires Special Attention—Natural and Artificial Lighting of Buildings—Pressure in Pipe Line Important

THERE is one of three things to do with the acetylene generator—it can be housed in a separate building away from other buildings; it can be housed in a lean-to building or shed adjoining your plant; or it can be installed inside one of your plant buildings. A separate isolated gas house is the ideal method, especially so if you go to the expense of having a substantial structure with floors at truck floor level, and divide the building into three or four compartments, using one section for housing the acetylene generator, one or two sections for the housing of calcium carbide and acetylene cylinders, and another section for the storage of oxygen cylinders. The isolated generator, carbide and gas storage warehouse need not necessarily be of fireproof construction, although such construction is preferable. In the case where it is decided to house the acetylene generator in a building which is a lean-to to your main plant, it should be separated from such plant building by an unpierced fire wall.

Where it is decided to house the generator inside one of the plant buildings, as said before, it is important to be sure that your insurance companies do not object, and also to see that you are not breaking some local ordinances. However, if such is not the case and you are housing the generator inside, a special compartment or room must be constructed, and such compartment be built of non-combustible materials. The door to such a compartment should preferably open to the outside, but if it does open into the main building or shop, the door should be of the fire, self-closing type. You will readily appreciate however, that it is far more desirable to have the door open to the outside; then if there is any leak of gas there is no chance for the gas to escape through the door into the main building or shop, with the possibility of being ignited by some heat or spark-emitting device.

In the opinion of the writer the acetylene generators should not be installed inside buildings where the building is more than one story in height, except in the case of a special generator house provided with two floors, when the second floor is sometimes used for the storage of a supply of carbide and for charging the generator. Be sure to see that the generator stands on a substantial and firm foundation. We know of cases where generators were put up on a flimsy foundation, which were later undermined by the water discharged from the generator, and as a result, the generator canted over and broke off certain piping connections, causing serious trouble.

The recommendations here set forth are made in the hope of serving the manufacturer and user of acetylene and help him to steer clear of accidents which need not occur. Remember that safe practice does not end with the proper operation of your welding equipment. Welding must only be used for work where welding can be considered good and safe practice for construction or repair. Some users become over-enthusiastic and attempt to employ welding on certain work where it should never be attempted and, consequently, fall down badly, with the result that it tends to give welding a bad name and creates a feeling of insecurity about the process in the minds of those who are considering its use.

A generator room must be protected from freezing. This is most important. Freezing up of acetylene generators is the cause of fifty per cent of the accidents that have happened with them. One should never attempt to lower the freezing point of the water by using calcium chloride in an attempt to do away with the necessity of heating, for the reason that the calcium chloride not only tends to corrode the generator itself, but will gradually permeate the whole piping system and cause serious trouble.

Generator houses should be provided with plenty of daylight illumination, and plenty of head room. It must necessarily be well ventilated, and also be provided with good and sufficient artificial illumination. This must necessarily be of the incandescent electric type, with globes properly protected and with switches outside the building. Certain existing rules call for acetylene generators to be charged during daylight hours only, but such rules are to-day obsolete and cannot be complied with for the reason that many generators are in constant use, and during the winter months it is necessary to charge in other than daylight hours. For this reason it is essential that the artificial illumination be good.

One would think to-day that any workman who could get a job would be educated sufficiently to know that you can't bring a naked flame in contact with a combustible gas without getting ignition or explosion—yet a considerable percentage of the accidents that have occurred with acetylene generators have been caused by this very thing. For this reason it is strongly recommended that good natural and artificial illumination be provided in the generator house, so that there will be no possible inducement for the thoughtless workman to strike a match or use a lantern when examining the generator. The instructions furnished by the manufacturers of acetylene generators for the installation of their machines should be followed closely, and it is advisable, when at all possible, to have the manufacturer install the machine and put it in operation.

It is quite unnecessary to say anything about the installation of acetylene gas piping, beyond stating that it should be of ample size to meet the estimated maximum demand and should be installed according to the requirements of the National Board of Underwriters. We venture to suggest that if any who have acetylene installations would secure a copy of the National Board of Fire Underwriters' rules, and would peruse these rules and observe whether the installations comply with them or not, quite a number would find that the National Fire Underwriters' rules were not followed when the installations were made. It should be appreciated that National Board rules are recommended and drawn up by the National Fire Protection Association, a body that has always made a point of consulting with the industry when preparing rules. Possibly it can be said that National Board rules are the rules recommended by the acetylene industry. You will find amongst the National Board installation rules, those calling for escape and relief pipes to be carried outside of buildings. Personal inspection has shown numerous installations where no atten-

As recommended by the National Safety Council.

tion was paid to this rule, and safety devices, if they were called upon to operate, discharged their gas inside of the buildings. This was asking for trouble.

A considerable number of the acetylene generators in use to-day for supplying gas to shop piping systems deliver the gas to the piping system at pressures up to 15 lbs. per square inch. It is therefore necessary to have the piping systems tested after installation at a good deal higher pressure than is commonly employed for testing out city gas piping systems. Let us now deal with the installation of the oxygen supply.

In the majority of cases, oxygen is used direct from a standard oxygen cylinder, a separate cylinder being used for each welding station or blowpipe in use. In some instances, however, a number of oxygen cylinders are manifolded together, the gas being supplied to the shops through a system of piping. In rare cases oxygen is manufactured on the premises, the gas being first collected in a gas holder and then compressed in a receiver to a pressure of a few hundred pounds, after which it is passed through a regulator and supplied to the welding stations through a system of shop piping.

In those systems where it is desired to manifold a number of oxygen cylinders and supply gas to welding stations, it is extremely desirable that the necessary manifolds be purchased from a responsible apparatus manufacturer or be made up to their specifications. Every care possible must be taken with the installation of the oxygen piping system. It should be appreciated that oxygen, when supplied in cylinders, is under a pressure of approximately 2,000 pounds per square inch, and consequently oxygen manifolds must be sufficiently strong to withstand this pressure. It must be borne in mind also, that no combustible material should be employed in making up the manifolds, for the reason that oxygen under pressure is liable to cause a spontaneous combustion of such material.

When assembling the manifolds and the piping system, great care must be taken to see that fittings, etc., are handled with clean hands. Crease on a joint or in the interior of the piping might cause serious trouble. The interior of the piping must be clear of all scale and rust, and should be thoroughly washed out with caustic soda before being put into service. It is needless to talk about the actual setting up of welding apparatus, beyond saying that the manufacturer's instructions must be followed to the letter. In those installations where both gases, oxygen and acetylene are supplied from a single cylinder of each gas, the cylinders should be so located that they cannot be knocked over or struck by passing traffic. In most cases, where the individual cylinders are employed, it is the best practice to have both cylinders mounted on a truck, so that they can be conveniently transported from point to point.

Now a few words about the operation and manipulation of the generators and other equipment. When starting up an acetylene generator the first time, the instructions of the manufacturer must be followed in detail. Where possible it is extremely desirable that the acetylene generator manufacturer should not only install the machine, but should put it in operation. After the generator is charged with water and carbide, a connection should be made at the extreme end of the piping system, so that the gas can be discharged from that point to the open air. It is most important, before starting to use the gas for welding, to make sure that all air has been purged from the generator and the piping system. Some common sense has to be used to judge when this has been accomplished, but in the average installation, the decomposition of 10 to 15 pounds of carbide will have generated sufficient gas to expel all air from the generator and pipe lines. You may possibly wonder why this is so important, and we will therefore endeavor to explain more clearly.

Under normal and proper working conditions, the pressure of the acetylene gas in your pipe lines and generator will never exceed 15 pounds per square inch. Pure acetylene gas (that is, acetylene without any air mixture) at any pressure below 15 pounds per square inch is non-explosive. It is possible to fill any empty cylinder with pure acetylene at a pressure of 15 pounds per square inch, fit the cylinder with a spark plug and make a spark, and there will be absolutely no ignition of the acetylene, but if there is a small percentage of air present, there will be a violent explosion. If the same cylinder were filled with acetylene at 30 pounds pressure, and there was no air present and the spark plug was sparked, there would be a violent explosion. The action of acetylene under pressure between 15 and 30 pounds per square inch is somewhat uncertain, but all the best authorities have definitely decided that acetylene should never be used in a free state at a pressure in excess of 15 pounds per square inch.

Now, let us assume that you failed to purge your pipe lines of air or mixtures of air and acetylene, and were to light a blowpipe that is supplied with gas from the pipe line, and then suppose that the blowpipe backfired—it would be possible for the backfire to propagate right through the piping system up to the flashback or hydraulic seal which is necessarily attached to the discharge outlet of all generators. This backfire along the piping system might be of sufficient violence to split the pipe or loosen the joints. Cases are known where, while the generator was being purged, a cap at the end of the piping system has been removed and a match applied, under the idea that as soon as the discharge from the pipe would ignite, it would show that all air had been driven out of the pipe. In such cases, of course, an accident has generally occurred, the mixture of gas and air discharging from the pipe having ignited, and owing to the orifice being large and the velocity of the gas and air comparatively low, ignition has propagated throughout the piping system.

BRIGHTENING UP INTERIORS

(Continued from page 40)

more small electric lights and along the shop fifty feet above the floor and over the crane runway were a number of large arc lights that were often almost entirely obscured by the dust coming in from the adjacent foundry, running parallel to the machine shop. As long as a man could stay at his machine all went well, but when a visit to the tool room was necessary, or when duty required a hunt for material on the floor or bench nearby it was like taking a trip into the wilderness blindfolded. On one occasion the writer nearly broke his arm on one of his frequent trips through the poorly lighted factory.

It might be stated that about a year after the time above mentioned, systematic investigations was made regarding the problem of more efficient illumination, with the result that an entirely new system of lighting was installed with due consideration being given to the effective diffusion of the artificial lighting by means of coating the walls with mill white paint. Under the new system of illumination the expense of lighting the plant, figured on a year's basis, was less than 50 per cent. of that of the year previous, and the production, based on actual figures, was increased upwards of 20 per cent., with less labor turnover. Workmen were better contented and changes were less frequent.

An unusual use of mill white paint was brought to our attention recently which emphasized the wide range of purposes for which a finish of this nature can be utilized. A manufacturer of black powder finished the walls of his plant with a high gloss white, in order to make the powder dust that settled on the walls visible, so that it could be brushed down readily. The high gloss surface eliminated any pockets where the powder might collect.

Fire hazard is an ever-present source of anxiety to every plant owner. This danger is exaggerated when conditions invite the accumulation of inflammable rubbish. The secretive nature of all humans seems to associate evil with darkness and when the average workman has a piece of waste, paper, or other seemingly useless material to throw away it seems second nature to discard it in the first dark corner he comes across. This surely is inviting trouble. The danger is additionally emphasized when smoking is secretly practised by some of the men, and the fear of detection causes them to throw a cigarette butt or partly burned match behind a pile of castings, radiator, or other secluded spot where darkness is the sole "redeeming" feature.

Practical Ideas From Practical Men

CALCULATING THE STIFFNESS OF SHAFTS

By W. F. Schaphorst

Referring to the article under the above title in the October 12th number of Canadian Machinery, page 24, there are some statements contained therein that are either not clear to me or typographical errors have been made. For instance, Mr. Livermore says that K may be obtained from the following expression:

$$K = \sqrt{\frac{1}{D}}$$

According to this, when D is equal to one degree we would have:

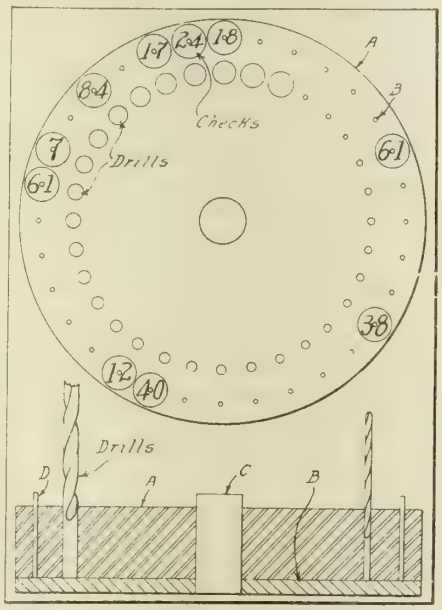
$$K = \sqrt{\frac{1}{1}} = 1$$

In the article, however, a table is given listing the values of D, varying from .25 to 10 degrees, and in this table the value of K corresponding with D when D is equal to 1 is K equals 0.0835, whereas the above formula gives the value as 1. If a typographical error has been made in the formula for K, it probably would have assisted readers like myself had Mr. Livermore given an example so that it would have been possible to have checked back. The value of K corresponding with D equals 4.50 is certainly a typographical error if the balance of the table is correct, as it evidently should be 0.0574 instead of 0.574.

TOOL CRIB DRILL STAND

By Harry Moore

Most tool cribs issue tools on the check system, that is, a system where each man is given a number of checks at starting, each check stamped with a number to identify the holder. When a tool is required, one of these brass checks is handed to the storeman in exchange, and when the tool is returned the check is handed back to complete the transaction. The trouble with the majority of these systems is, they don't work, and one of the main reasons for this is the mixing up of the checks in the tool crib itself. Mistakes are easily made at the best of times but the chances are greatly multiplied when the storeman endeavors to satisfy the demands of half a dozen impatient piece workers. Twist drills are perhaps the most frequently moved tools and the drawing accompanying this article shows a tool crib drill stand with a few special features of its own. Two stands were tried out before this one was developed. One was made from a square block, with the drills held closely together, this feature necessitating the use of hooks in line with the drill rows for the purpose of locating the checks. If two or more drills were taken out of one row, a single hook had to take care of all the checks on that line; which naturally led to confusion. Stand number two was a long narrow block holding a single line of drills spaced far enough apart to permit a check to be placed in front of each one if necessary. When this was adopted all checks were drilled with a small hole in the center to allow them to be placed over a pin driven in place on the drill stand. The objectionable part about this type of stand is the amount of space required to mount it properly, and for this reason we brought out the circular drill stand shown. It is made from an old flange casting, drilled in a circle for the drills and outside this circle for the pins that locate the checks opposite the drill they have been exchanged for. The flange A rests on a thinner flange B both swivelling on a stud C inserted in the bench. It will be readily noticed that this kind of drill stand makes for orderly arrangement in this particular department of the tool crib by lessening the chances of mixed checks; indeed, it would be a pretty careless toolman that was incapable of dropping the check over one of the pins D as the drill was being removed.



Tool room drill stand.

THREADING PLUMBERS' NIPPLES IN THE SHOP

By D. A. Hampson

The average plumbing shop boasts a pipe machine that will thread up to 4-in. or 6-in. pipe. When the occasional jobs come along that make use of larger sizes the plumber goes to the machine shop to get the pipe cut off and threaded. Every machine shop doing job work should have "pipe centres" to fit one or more lathes of 20-in. swing or larger. The reason they should be fitted to a lathe of this size is because the steady rest has to be used frequently on this kind of work and the rests supplied with lathes of 16-in. swing are seldom large enough to take in even 6-in. pipe.

The pipe centre is a tailstock centre. Two "heads" will do the average range of work better than one—one to take all sizes up to and including 6-in. pipe and the other from 6-in. to 12-in. Each of these heads are cones made of cast iron, faced on their outside surface to an included angle of 60 to 80 deg., and having a hub bored and faced to turn on a stem that is placed in the tailstock sleeve in the taper hole that ordinarily holds the centre. The change from ordinary centre to one of the pipe centres does not take five minutes. The head of the pipe centre has more bearing in the pipe than on its stem, consequently it rotates with the pipe—the stem must be lubricated, and often a thrust bearing is employed as a refinement. At the driving end, a good four-jaw chuck is better than trying to use a live pipe centre—the former serves to drive and to true the pipe.

Invariably, the conditions are as follows. A plumber or steam fitter brings in a length of pipe. It already has a thread on one end, maybe on two. He wants so many nipples made out of this pipe and threaded. Usually he brings in a fitting to go by in making up, though often he says "make the threads same as the old ones." Quite often the pipe is much longer than the lathe. Long pipe must be steady-rested. Short pieces are held between chuck and pipe centre.

Shop foremen do not look with pleasure on the pipe jobs that come in. They are apt to cost more than can be reasonably charged for them. If a machinist does not break a thread tool or a cut-off tool before he gets done, the foreman heaves a sigh of relief. Added to this (which cannot be charged up) there is a good deal of wear on steady rest jaws, more or less time spent clearing up which does not seem to get in on the bill, and miscellaneous time of a man "to give a lift" here and there. But the big expense is for tools. Here is how to avoid this tool expense.

Wrought iron pipe is "tough goods." The material is stringy to begin with. Then there is a mean scale on the outside, which is made worse because the pipe is not round, and so the tool skates over this scale for several revolutions before it gets under all the surface; by

that time it has a dulled edge which cannot help pinching and sticking as it penetrates further. Quite often the pipe has seen long use and the exterior has a coating of rust or concrete. Any formed tool, such as a cut-off or a threading tool, has a hard time working against such odds.

The only proper method is to use an ordinary turning tool to cut the surface down to clean metal. Do this first and one great source of trouble is eliminated. And on what is to be a threaded end, turn the taper portion too—don't leave it to be slowly cut down with the thread tool. The great gain in using a turning tool instead of the formed tool lies in the fact that it is a natural roughing tool, shaped for hard work and usually made of tougher material than both the thread and cut-off tools. And when a piece of pipe is merely to be cut off—not threaded in the shop—the turning tool is of assistance. Here, the tool is made to cut a section about double the width of the cut-off tool, getting well under the scale. Then it is fed in at the centre, working it sidewise a bit so that it does not hog in, and its rounded point removes a good volume of metal that the cut-off blade would have to otherwise.

Too many men cannot seem to make head way on a pipe job. Assume that a piece of 8-in. pipe a foot long with threads on both ends is brought in with instructions to cut it in two and make two threaded nipples of the halves. What does the average man do? He puts on chuck and pipe centre. Then he gets a cutting-off tool and feeds it straight in; the unevenness of the surface and the scale take the edge off before the cut is one-quarter made and then the tool begins to dig and sputter. In an attempt to remedy this the man spills lard oil on by the pint, but it doesn't help and pretty soon—Bang! The blade snaps off, and there goes all the profit on the job.

Some delay (and advice by the boys) and he gets another tool to start afresh. Finally the piece is severed. After recentering, he goes at the thread with a nice sharp thread tool on the uneven, scaly surface. In some cases he does get another tool and chamfer the corner first. He proceeds to cut a full thread with the V-shaped tool but, unless he has made several sharpenings to put back the edge lost on the scale, his thread is all torn and bears little resemblance to the smoothly-formed one needed to make a nice pipe job. Not only does he cut a full thread, but he has to make the thread tapered, which means reducing the diameter about one-sixteenth at the end—doing this the slowest and hardest way, by using the thread tool.

The job has taken over three hours. The foreman knows that two hours and a half is more than it is worth, but he takes the chance of a kick and puts it down that way; there is no way of recovering the loss of the threading tool. An impartial, unofficial observer would remark what the foreman also knows in his heart—that that kind of job might better not be taken.

Now, if this same job were undertaken by a man who followed the method outlined above, what would be his procedure? After chucking and centering as before, this man puts in his faithful round-nosed or diamond-point tool. He had the belt on the slowest "open" speed for truing up and he leaves it there, for his turning tool will stand such a speed without serious results. As there was no fitting sent in with the job, calipers have to be used; these he sets to the root diameter or less and, marking the centre with a piece of chalk, he scoops out a spot there that the calipers will pass over easily. The work of the cut-off tool is then more than half done.

Next a section about 2-in. long is turned on each side of the groove, turning off the black. Reversing the feed, any skilled man can "back cut" and feed in his tool to give a good enough taper for threading; or the taper attachment can be used, though it is hardly necessary after a little practice. The thread tool is next set in the post. It will last for several threads without grinding because it has clean metal only to cut. If a narrow-pointed diamond point has been used for rough turning, this same tool can be used to rough the thread and in so doing it will relieve the thread tool that much more—the only precaution is not to go so deep that there is not metal enough to finish with the V tool. Rough threading with the diamond point can be done on belt speed, then the gears are thrown in for finish threading and finish cutting off. The saving in time on this faster speed is considerable.

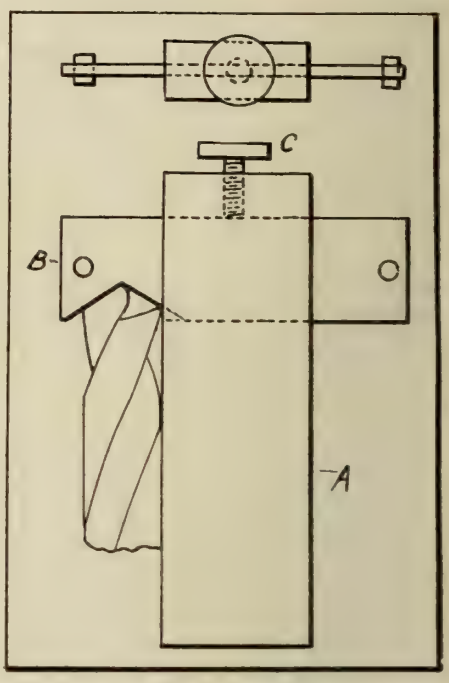
If there is a taper attachment on the lathe, it is set for the thread angle, or taper. But most lathes in job shops on this class of work do not have attachments. Therefore the machinist must depend upon measurement and his eye. By having the O.D. turned to approximate taper, it is easily possible to cut a thread of very fair taper fit.

The man who has used this method has his job finished in an hour and a half and the lathe straightened up. He has no broken tools. He has not created excitement for the boys. Everything went off smoothly and the shop makes a profit. Thread jobs on pipe are of too frequent occurrence and cause too much loss for executives to lose sight of a simple method of turning this loss into a nice business.

TWIST DRILL GRINDING GAUGE

By H. T. Osborn

In grinding twist drills by hand, considerable trouble is often experienced in getting both lips at the same angle, as all who have ever done it know. Unless the point or scraping edge is quite central and cutting edges at the same angle as each other and, consequently, of equal length, the drill will cut a larger hole than intended. Often this does not matter much but, anyhow, the drill works smoother and at a heavier feed when ground correctly. Even machine-ground drills are not necessarily exact. Feeling the need of some kind of a gauge that would bring these errors into visibility, I recently made up the little tool shown in the sketch. It consists simply of a



Twist drill grinding gauge.

stock A having a blade B which slides in a slot through A and can be locked by the screw C. In use the drill is placed as shown and the blade adjusted to suit the size of drill, bringing drill to lay along the stock A. When held up to the light in this way the slightest errors become glaringly apparent. To test the centre, the drill is tried in this way and then given a half turn and tried again, as will be readily understood. We have found this device quite successful and it doesn't cost much to make, being a piece of cold-rolled steel bar and a piece of hack-saw blade.

In the operation of machine tools, especially those working frequently on cast iron, where considerable dust is nearly always present, it is a good plan to wash out the bearings periodically with gasoline, to thoroughly clean them of dirt and grit.

The flash point of an oil is an approximate measure of the temperature at which inflammable vapors begin to pass off. It is, consequently, an indication of the fire hazard. A minimum value is generally specified by law, which for fuel oil is usually 150 deg. F. by the Pensky-Martens closed tester. As the flash point depends somewhat on how determined, the type of instrument used should be specified.

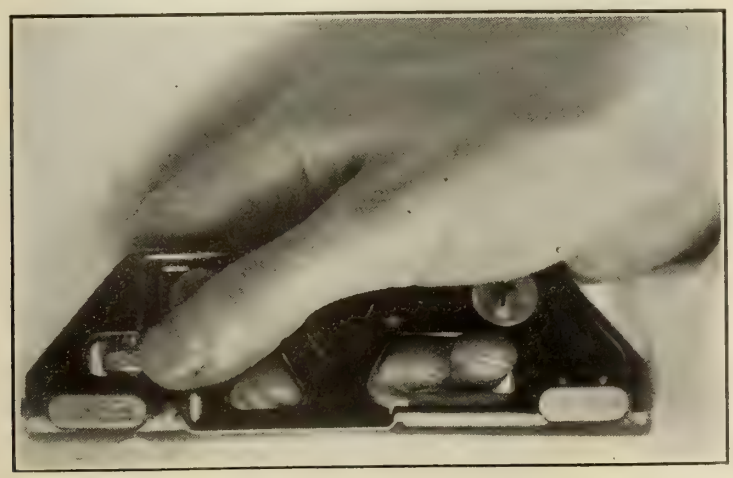
New Things in Shop Equipment

MULTI-DIAMETER TOOL

A multi-diameter counterbore, fitted with separate blades for different diameters, has recently been developed and placed on the market. The device is primarily intended for machining core holes on automatic engines, and for machining spark plug holes, but may be adapted to a variety of uses within its range. The tool can be made to finish as many as six diameters by means of one cutter. Small diameter blades extend full length and are placed between others that cut the larger diameters. It is claimed that the tool has a long life. On the double diameter tools it is possible to grind both the diameters the full length of the blades. These multi-diameter tools are made by the Eclipse Interchangeable Counterbore Co., Detroit, Mich., and are interchangeable with other tools manufactured by the concern.

ADJUSTABLE LIMIT LINE GAUGES

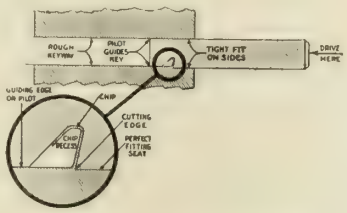
A "go" and "no go" type of internal measuring gauge, which is entirely new in principle and design, has been developed and added to the already extensive line of precision instruments. Two spherical-ended hardened-steel pins are carried in a cast-iron frame, similar in construction to the P. & W. "trusform" gauges. Built like a bridge truss, it combines strength with lightness and successfully resists the tendency to distort or warp. One pin is adjusted to any size within its range by means of opposed set screws which lock the pin firmly in position when tightened. The opposite pin works between two stops, one of which is adjustable to give any desired limits from .001 to .025 in. This pin is instantly moved by a simple motion of the thumb and finger inward to the "go" position or outward to the adjustable stop for the "no go" size. All adjustments may be readily sealed to prevent tampering with the measurements. It is a simple matter to test the setting at any time or change it to compensate for wear. Four removable brass discs provide ample space for working. These instruments are the product of the Pratt and Whitney Co., New York.



Adjustable limit internal gauge.

KEYTITE SELF-FITTING KEYS

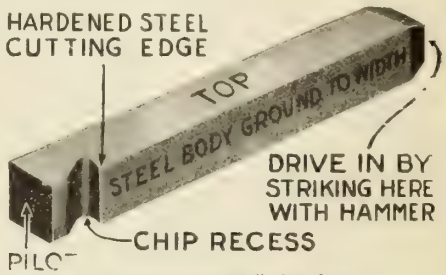
In almost every industry keys are used to make the driving connection between shafts and couplings, gears, sprockets, pulleys, etc. It is usual to mill or slot



Showing method of application.

the key in the shaft and to slot the keyway in the external member. But both of these keyway sizes will vary slightly and to obtain the desired tightness between the key and keyways it has been necessary to carefully fit the parts together. This has usually been done by hand, either by filing the key to fit the keyways or by filing or scraping the keyways to fit the key. It usually takes a good mechanic three or four hours to fit an ordinary 1½-in. x 1½-in. key. A key slightly smaller, say 1 in. x 1 in., may require only two hours and in exceptional cases may be fitted well enough in an hour. But the mechanic needs to be experienced and the key and keyways need to be almost the right size to start with in order to obtain even these results. Such hand fitting generally is quite expensive work and the results are not always satisfactory.

In the new keytite self-fitting keys, a tough chisel stock is used and this is ground to a size very slightly larger than the nominal keyway width. A cutting edge and chip recess are provided near the front end of the key. Ahead of these is a pilot slightly smaller than the nominal keyway width. To install one of these keys, the pilot is entered first with the cutting edge at the side. Then the key is driven home with an ordinary machinist's hammer or with a sledge, de-

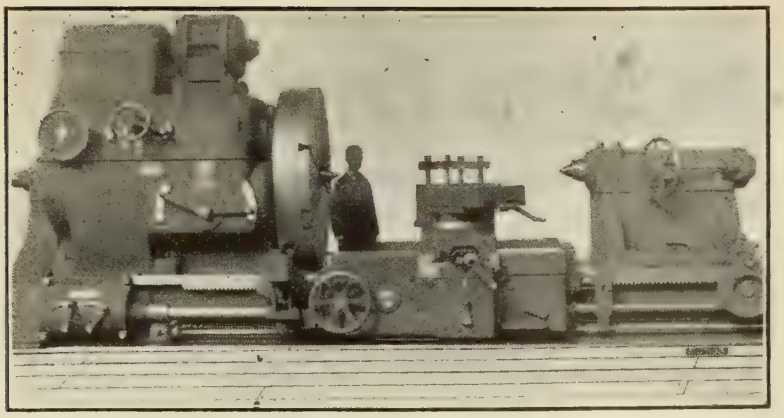


Features of self-fitting key.

pending upon the size of the key. The cutting edge sizes the keyways and, it is claimed, makes a tight fit between the body of the key and the keyways. In the larger sizes cutting edges are sometimes provided on both sides. When it is desired to fit top and bottom as well as on the sides, a cutting edge is also provided at the top. Gib keys and other modifications can be furnished as required, all with this self-fitting advantage which saves the cost of hand fitting and which always provides that the key will be a tight fit in the keyways. These keys are being placed on the market by Smith and Serrell, Newark, N. J.

HEAVY TYPE ENGINE LATHE

The machine here illustrated is a heavy-duty, 60-in. swing lathe which has been placed on the market recently. It is fitted with a constant-speed motor of 40 h.p., and has 24 faceplate speeds obtained by speed-change gears operated by levers conveniently located on the headstock. The motor may be started and stopped by a handle mounted on the carriage, for either alternating or direct-current motor drives and, in addition to this, when the lathe is driven by a direct-current motor any faceplate speed within the range of the motor may be obtained by the same handle. A push button on the headstock may be used for "jogging" the driving motor to allow quick and easy shifting of the speed-change gears. The headstock is of heavy and substantial design and is entirely enclosed, preventing injury to the operator or the gearing. This also allows all



Heavy-duty 60-in. swing engine lathe

bearings and gears to be continuously oiled by means of a pump supplying filtered oil to a large reservoir in the upper part of the head, from which it is distributed by pipes into a settling tank in the base of the head from which it is pumped through a filter back to the reservoir.

The faceplate spindle bearings are exceptionally large. On account of their slower speed they are fitted with oil-distributing rings and large oil wells in addition to the continuous oil supply. The faceplate has four pairs of parallel slots at right angles to permit attachment of heavy steel faceplate jaws. The tool steel centres are hardened and ground and fitted with large spanner nuts for easy extraction. The tail spindle is of ample diameter for stiffness when run out and is carried in a substantial tailstock having increased diameter near the centre. The tail spindle adjustment is by gearing and a hand wheel located on the side in a position convenient for the operator when placing work on the centres. The tail spindle has double clamping bolts for securing in position when set. The upper portion of the tailstock has a cross adjustment by a screw for use in turning slight tapers and is clamped to the lower section by heavy bolts independent of the bolts which clamp the tailstock to the bed. The adjustment of the tail spindle is not changed when moving the tailstock on the bed.

In addition to the large bolts which clamp the tailstock to the bed, there is a tail brace pawl provided engaging a ratchet in the bed, absolutely preventing any slipping of the tailstock under heavy end thrust. The pawl may be lifted out of the ratchet by a handle on the front of the tailstock. This ratchet is in sections, readily removable to allow cleaning out chips which may accumulate in the bed. The tool carriage has lateral, cross and angular power and hand feeds and also a rapid traverse along the bed by a 5 h.p. motor and drum switch with spring return to off position mounted on the carriage. The control of the driving motor is also obtained through a handle on the carriage. The tool slide is of the full width of the bridge and has clamping bolts and straps for securing the cutting tools. Large micrometer collars are fitted on the crossfeed screws.

The carriage apron is of one-piece type enclosing the gearing. All shafts have bearings at each end and the gears and bearings are oiled from one reservoir which is filled from the top of the carriage. The direction of any feed may be changed and started or stopped at the carriage. The operating levers are conveniently located and interlocked so that neither two feeds nor a feed and thread cutting can be engaged at the same time. The thread of the leadscrew is used only for thread cutting, the feeds being obtained from a spline in the leadscrew. The feeds or threads are obtained through a quick-change gear box giving four feeds or threads without removing gears. This covers the ordinary range of work and any other feeds or threads may be obtained by change-gears provided at the end of the headstock. All of the gears and bearings in the feed box are oiled from a tank providing an ample supply. On lathes with long beds, the leadscrew and the controller shaft are supported at intervals by bearings which are automatically spaced by the carriage. There is a steady rest included which has five jaws with screw adjustment and large wearing surfaces. These lathes are manufactured by Niles Bement-Pond Co., New York.

RAILWAY WHEEL GAUGE

An interesting and serviceable gauge for use on railroads for accurately determining the amount of metal to be removed from a worn wheel in order to restore the proper contour, has recently been developed and placed on the market. The gauge gives a direct reading of the amount of service metal on a steel or steel-tired wheel as the basis for billing foreign roads for wheel replacements according to Interchange Rules. It indicates whether or not a worn wheel is worth turning to restore the standard contour, and the thickness of service metal which will remain after turning. This measurement can be made either before or after machining. The gauge can be set to the wheel in a dark place, if necessary, and then taken to the light for reading, thus avoiding errors and guesswork. When applying the gauge the side pointer is swung clear and the gauge placed over the wheel with the face bearing on the inside, with the centre pointer bearing on the worn contour. The limit of wear pointer is then placed in the limit of wear groove and all other pointers allowed to come in contact with different parts of the face of wheel. The gauge is then removed and front plate moved downward until the lower edge coincides with the lowest of the four sliding pointers. The reading on the plate scale indicates the amount of metal to be removed to restore standard shape, while the reading on the pointer scale shows the amount of service metal remaining after the turning operation. The gauges are manufactured by the Pratt and Whitney Co., New York.

Montreal.—Canadian Castings, Limited, incorporated with $20,000 capital, will conduct a general foundry and machine shop business.

No Easy Re-Adjustment Plan

CANADIAN correspondents to English publications picture the Canadian West as having a fit of the blues, as despondent, as having been victimized by boomsters and speculators from the East.

While much of what is said is not without a degree of truth, it does not appear that the West has any more reason for despondency than have a good many industries in other parts of Canada. Whatever conditions have caused despondency, they have not deprived the West of the means toward a great future. All industries have been confronted with painful duties involved in readjustment. One of the most prominent Canadian financial men expressed a doubt recently as to whether the West was willing enough to adjust itself as a whole to the problems of readjustment. He referred, as an instance, to the heads of two large establishments who, although considerably in debt, could afford to spend the winter in California. He doubted that the West was adapting itself fully to the necessity of sacrifices to the same general extent as the manufacturer of the East. Yet the Canadian West was far and away ahead of the Western States in the early days, as regards prosperity and possibilities. He doubted not that readjustments would be most painless where they met with most willing disposition to make them so.

Manufacturers attempting to make collections in the West have been sadly handicapped by legislative enactments giving individuals too great a measure of relief from financial responsibility. This, it is claimed, may in time seriously affect that spirit of independence for which the West has long been noted and through which, after all, comes proper recognition of the inter-dependence of all sections of the country. Manufacturers in the East had no such assistance, and many have been operating for some time "in the red" or at a loss.

Mining Regions Offer Market

IT HAS BEEN pointed out frequently in these columns that an exceptional market for steel, electrical equipment, drills, pumps, rails, steam shovels, labor-saving machinery for lifting and dumping, is developing in the mining regions of the North.

Although Canadian manufacturers have by no means neglected this field, it may be questioned whether the importance of the prospect has been fully recognized. While it is difficult, at times, to separate the wheat from the chaff in respect to gold mines, or to ascertain which has a future or which has not, this is hardly as important as it might seem. A great amount of development work is being done, much of it on property of positive merit. Sufficient has been accomplished in connection with gold or silver factories, as they are called, to warrant consideration of this business as likely to take rank with any of those departments of the market that have established earlier claims to importance.

To outside enterprise, also, the field has an increasing appeal and it would not be surprising to see new industries encouraged to locate stocks or branch factories here to better serve this market. Dealers and manufacturers who are already in contact, say it is entitled to the broadest vision. A recent instance might be quoted, in a recent report of F. W. Field, British Trade Commissioner, Toronto, who recently paid a visit to the Ontario gold fields. He pointed out that "there is a good demand in Northern Ontario for the following mining machinery and supplies, estimated at a value of 20 to 30 million dollars." He further observes that the opinion was frequently expressed that manufacturers in the United Kingdom should warehouse fairly substantial supplies at Montreal or Toronto for that market. A stock of standard sizes of wire rope and finished machines in sizes likely to be of service, he said, should be carried.

To Please Through Service

EARLY interviews with Sir Henry Thornton, new head of the Canadian National Railways, seem to establish as correct first impressions that he is the kind of man not likely to be swayed by the feeling that offence might result, in any quarter, from decisions otherwise calculated to be in the best interests of the system. His observations as reported credit him with a sense of responsibility and of the feeling that the avenue to success is not the one that is lined with good-natured intentions to please everybody.

Questioned as to location of the head offices of the system, he replied that they would be wherever practical wisdom dictated they should be. He added that somebody was going to be peeved, whatever the choice. As a business proposition, the future of the people's road could not be bound up with matters of petty preferences. These did not enter into its duties to serve Canadian transportation needs efficiently.

Machine tool men, and manufacturers of other equipment look for some activity in buying, now that a directing executive head has arrived. Whatever move is made, it will be based on thorough investigation of the system's requirements, and to familiarize himself with these, Sir Henry seems to have made an early start.

Editorials in Brief

Index price of eleven commodities in iron and steel for October shows a decline of two points from last year's price and of 86 points from October 1918. Conservative buyers must consider that for the past two years prices have maintained a fairly stable level and that temporary influences do not indicate marked movements in either direction.

Steel Men Report Encouraging Year-End Business

Weather Favorable to Prolonged Building Operations—Hoops, Rods, Sheets in Demand—Pittsburgh Reports Continued High Production—Prospect of Firmer Prices Early in New Year

SENSITIVE INDEX IN IRON-STEEL OUTPUT

THAT present price movements in pig iron parallel, in an interesting way, those of the past hundred years, is the observation of a Pittsburgh statistician. Commenting on the fact that the rate of production was higher in November than in October, and that the 40,000,000-ton rate is higher by more than 15 per cent. than that of the six months prior to Oct. 1, he points out that, as the world progresses, there have been permanent output advances. This result follows in spite of very material increases or decreases from time to time and prices, likewise, find adjustment. In 1815 the average price of pig iron was $53.75; in 1850 it was $20.87; 1872 average, $48.87; 1878 average, $17.62; 1897 average $9.50; July, 1917, average, $55.56; September, 1920, average, $48.50; March, 1922, $19.38; September, 1922, $33.50.

Twice in the past ten years pig iron has sold at about $50 while present prices are close to those of 1803, when the average was $29.25. It is pointed out that any future estimate as to the steel industry must keep in mind this ever-changing character. Its basic relationship to industry generally brings it within the influence of almost every factor making for fluctuation. That is the great reason why iron and steel are regarded as a sensitive barometer of industrial conditions.

Canadian markets are running according to form. The present year has been characteristic. January price on pig iron was $29; February saw a reduction of $2 per ton. Due to strike influence there was a gradual advance through the summer months and in September it registered $39.30. There have been gradual reductions since that time until today the price of pig iron of 2.25 to 2.75 silicon is $32.30. The last reduction of one dollar per ton became effective during the past week. This price is a little better than Buffalo quotation, $26.50, plus $2.80 duty; $3.30 freight and 40 cents sales tax. The tendency of the Canadian producers is to meet the Buffalo price, if at all feasible. It is estimated that absolute rock bottom is but a few notches distant, and that the market is showing little evidence of strong demand.

There is pronounced optimism in the Canada steel market as the year end approaches. Mild weather has brought out business that would otherwise be lacking. Demand for sheets continues strong. Building operations have not been as seriously interfered with as is usual at this time of the year, and contracts are being hurried to completion. No price changes of note have occurred, but there is a growing feeling that the New Year will see advances in certain lines. Large producers in the Pittsburgh district have made no change for the first quarter. Independent operators assert that there is no profit at present figures. Buying is inclined to be conservative so far as advance requirements are concerned. There is very strong demand, however, for tubular goods, and there is urgent call for deliveries.

Toronto

December 6.

DEMAND for building materials continues strong as weather favors completion of contracts before heavy frost sets in. There is a good market for sheets, bars, hoops and metal lath. Improvements in shipments will enable much work to be done that would otherwise be held over.

Iron and Steel. Dealers report that the year will close with a very satisfactory record. Although no announcement has been made as to the new year, it is felt in some quarters that advances are due in certain lines. Frequent assertions that competition has reduced profits almost to the fading point are heard, and it is predicted that U. S. markets must soon show the result of increasing production costs. One large dealer states that he is taking steps immediately to cover requirements in bars and sheets at present levels. His opinion is that the market is on the verge of an upward movement. Local prices:—

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 15
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		4 25
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 00

Old Materials. Asked for an opinion as to the report that prices on old material were due for a decline, a large dealer stated that, on the contrary, it would not surprise him to see an advance in certain lines. While coppers were easy, there was great scarcity in better classes of iron scrap. Though the demand was not urgent, one condition offset the other to such an extent as to discourage any idea of decline. Buffalo reports indicate that stocks of heavy melting steel are very low. Dealers, it is said, are building up their stocks of material in anticipation of big business early in 1923. Recently buying has developed on a large scale. Dealers' average buying prices:—

Copper, light	9 00
Copper, crucible	11 25
Copper, heavy	11 00
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Non-Ferrous Metals. Canadian demand continues along conservative lines. It seems to be a matter of supply houses carrying, for the time being, the requirements of the trade so far as the small foundry or buyer is concerned.

London reports a firm undertone in the tin market, with some improvement in American demand.

Copper trading continues comparatively light and prices have undergone no change for the first quarter 1923.

Although zinc has shown a disposition to sag in London, the New York market is firm. Supplies are not any too heavy and some producers are behind in deliveries. Current prices follow:—

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

Montreal

December 6

THE outstanding feature of interest here this week is the forthcoming banquet to be tendered by the Board of Trade to the new president of the Canadian National Railways, Sir Henry Thornton. It is expected that he will give an indication of his policy in regard to the co-ordination of the different groups of government-owned railways and the business section is intensely interested in knowing if this is likely to shape out and also what plans may be devised for the enlargement of their equipment, both locomotives and freight cars, and nothing would be of greater interest to the Canadian manufacturers than to receive an indication that the near future is likely to see large orders for new equipment placed on the market.

Iron and Steel. No price changes have been announced in general steel com-

modities this week and the level which has been maintained for the past few weeks still continues to be quoted and will probably continue for some time. Supplies in warehouses on the whole are not over-abundant, due to the continued difficulties existing in transportation conditions from the American sources of supply and if the local demand was greater than it is there would be a general all-round increase in prices. It is only the quietness in the trade here which keeps prices steady.

Iron bars, base	3 15 to 3 25
Steel bars, base	3 15 to 3 25
Reinforcing bars, base	3 15 to 3 25
Steel hoops	4 00
Tire steel	3 25 to 3 40
Spring steel	7 00
Band steel, No. 10 gauge and 3-16" base	3 65 3 75
Small shapes	3 40
Sheets, black, No. 28	4 75
Shets, blue, ann., No. 10	4 10
Canada plates, dull sheets	6 50
Canada Plates, all bright	7 00
Galvanized Sheets, No. 28	6 50

Pig Iron. Commenting on the decline in pig iron prices, a large dealer states: "A further reduction of $1 per ton in the price of Canadian-made pig iron was necessitated by the keen competition from the United States, particularly the Buffalo district. Demand for pig iron is showing slight improvement, but little or nothing is being bought for delivery beyond the present month, consumers apparently preferring to feel their way in the hope of being successful in making purchases at the low point of the market. According to up-to-date reports from the United States, it would seem as if there is a growing feeling that prices are now at almost, if not quite, the low point and that there shortly will be an improvement in buying which will result in some up-turn in prices.

Algoma, No. 1, car lots on Tracks, nominal quotation	35 15	
Summerlee, 30-ton lots, dock	35 00	....
Carron, 30 ton lots	35 00	....
Do., 5 ton lots, ex. warehouse	40 50	....

Non-Ferrous Metals. Markets continue somewhat inactive and reflect, to a certain extent, a feeling that prices have an uncertain trend. English and American markets are, in fact, suggestive of this and do not seem favorable to active buying movements. Local prices:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	42 75
Lead	7 75
Spelter	9 50
Antimony	7 50
Aluminum	22 00

Pittsburgh

December 6.

FROM the safe and sane viewpoint, the outstanding feature of the steel situation is the way in which production holds up. The rate of production has been about **40,000,000 tons a year, or** more, since October 1, and, in advance of the regular monthly report, the appearance is that the rate was somewhat higher in November than in October. The 40,000,000-ton rate would be more than 15 per cent. above the average rate in the six-months' period prior to October 1.

In the six months referred to, consumption did not exceed production, as the period did not start with any stocks to draw from. It would not be natural for consumption to increase at this time of the year, nor is there evidence that it has increased in many quarters, while in some directions there are no doubt decreases. Necessarily, when production increases at one time it must decrease at another, although over periods of years there are permanent increases as the world advances. Prices, likewise, must come down after advances, and vice versa. Thus the average price of pig iron was $29.25 in 1803, $53.75 in 1815, $20.87 in 1850, $36.87 in 1854, $20.25 in 1861, $48.87 in 1872, $17.62 in 1878, $28.50 in 1880, $9.50 in 1897, $55.56 in July, 1917; $27.95, April to October, 1921; $48.50 in September, 1920; $19.39 in March, 1922, and $33.50 in September, 1922. The figures through 1880 refer to foundry iron at Philadelphia, the later figures referring to Bessemer iron at valley furnaces. The market now is close to that of 1803, while more than 30 years ago it frequently sold at $20 or less and twice in the past ten years it has sold at about $50. Nevertheless, the typical market report, curiously enough, refers to price advances as being natural and normal and passes over declines as if they were unnatural and unusual.

As to fluctuations in production, there was a record rate of pig iron production in October, 1907, while two months later, in December, the rate was only 44 per cent. as great. In steel ingot production, there was a high rate of production in October, 1920, while in the following July the rate was approximately one-fourth as great, having decreased nearly 75 per cent.

The steel industry has been likened to a kaleidoscope, and judgment as to the future is very likely to be wrong if this fact is not borne in mind. If the trade is stagnant, one must not assume it will continue so and vice versa. The fact that from April 1 to October 1 steel mills were unable, from physical reasons, to make as much steel as their order books provided for does not prove that they will be under similar pressure to produce in the next six months. They may be or they may not be.

Coal and Coke

Coal markets continue soft, on the whole, as they have been for two or three weeks past. In the last few days steam coal has been a shade easier in price. Domestic lump has stiffened, with some mines obtaining advanced prices, up to $5.25 or $5.50. Gas and by-product show a considerable range according to quality and it is not easy to say whether or not they have declined. Pittsburgh district steam coal is $2.50 to $2.75, with gas at $3.00 to $3.75, chiefly at $3.25. Connellsville steam coal is $2.25 to $2.50, with good-grade by-product at $3.25 to $3.75.

Connellsville furnace coke is a trifle easier, say 25 cents, at $7.00 to $7.25. Production increases continuously while consumption grows in jerks, as one idle furnace or another comes in. As most of the furnaces are contracted to the end of the year, spot coke does not sell very readily. For regular shipment over December $8.00 or higher is quoted. On tentative inquiries for first quarter some operators have quoted $8.00 and none seem disposed to go below this figure at present, while furnaces are not at all interested, feeling that pig iron conditions are and will remain such that much cheaper coke is necessary.

Pig Iron Is Easier

Valley pig iron is down $3 on Bessemer to $28, $1.50 on basic to $25.50 and $1 on foundry to $26.50, though in foundry it must be noted that single carloads of particularly desired brands have been going chiefly at $27.50. Prices are f.o.b. valley furnaces, freight to Pittsburgh being $1.77. In the case of Bessemer and basic the quotations given are practically asking prices, there having been no late transactions to test the market properly.

Predictions As To 1923

Sheet bars show no regular market. Contracts for the current quarter were chiefly at $38 Pittsburgh or Youngstown. It is plain that prompt lots could be bought at $37, and they might possibly be secured at less. Some of the fourth-quarter tonnage will probably have to hold over, mills not being able to specify as fully as expected. A fair guess is that the ordinary price for first-quarter will be not under $33 or over $35. Billets show no activity and are usually considered quotable at the same level as sheet bars.

Finished Steel

Bars, shapes and plates continue to be regarded as being at a general market level of 2.00c, but right along there have been concessions on particularly desirable orders, and such concessions are increasing. It is commonly expected that prices will be lower, the chief question being whether there will be much readjustment in the next few weeks. As no very large tonnage has been sold at 2.00c or the higher prices ruling between one and three months ago, for early deliveries, while some deliveries are still being made on old orders at around 1.50c, a decline in the open market to 1.75c or 1.80c would not really be especially important.

Claim No Profit

Some of the independent tin plate mills have not yet recovered from their disappointment that the Steel Corporation, in making its price for first half on November 23, did not advance from $4.75. Independents claim there is no profit at this figure. The sheet mills had been expecting an advance but as the market had weakened by the time the 3.35c price was reaffirmed they were not surprised. Sheet buyers are very conservative, making commitments only

for material needed very shortly, and the market is hardly more than steady, at 2.50c for blue annealed, 3.35c for common black and 4.35c for galvanized. In automobile sheets there is some uncertainty. When, on November 23, the Steel Corporation continued its 4.70c price, the independents had a firm market of 5.00c, and they are indisposed to go down to 4.70c if they can avoid doing so.

Tubular goods continue to be by far the strongest item in the finished steel list. Pressure upon the mills for deliveries is heavy, particularly in the smaller sizes of merchant pipe, while there is not a little new buying. Prices are very firmly held.

Wire products are firm, with a fairly good demand, under the leadership of nails, plain wire being 2.45c and nails $2.70. There is no thought in the trade that these prices will come down within the discernible future, and an advance is not an impossibility.

BETHLEHEM EXTENDING LINES

In the light of recent reports that Bethlehem Steel Corporation are negotiating for purchase of a Canadian tin-plate mill, it is interesting to note that the Corporation is pursuing a somewhat aggressive policy in extending their lines. Following their absorption of the Lackawanna Steel Co., at Buffalo, they have now purchased most of the properties of the Midvale Steel and Ordnance Company and its subsidiary, the Cambria Steel Company. The consolidated companies will have a capitalization of $456,000,000. Eugene G. Grace, president of the Bethlehem Steel Corporation makes the following statement in connection with the purchase:—

"The acquisition of the Midvale and Cambria properties will give to Bethlehem important lines of steel products which it does not now manufacture, such as wire rods, wire and wire products, steel freight and mine cars, steel wheels, boiler tubes, agricultural implement parts, etc.; in fact, it will place Bethlehem in position to produce all the so-called commercial steel products with the exception of pipe and seamless tubes. For these Bethlehem is planning to build plants at one of its existing properties.

"Bethlehem's present annual ingot capacity of 4,890,000 tons will be increased to 7,600,000 tons by the Midvale-Cambria purchase.

"The combined investment in property and plant, less depreciation and depletion will be about $465,500,000 and the aggregate net quick assets will be about $133,700,000.

"The stockholders' meetings and the other proceedings will require sixty to ninety days before the transaction can be concluded. In the meantime, the Bethlehem management will be acquainting themselves with operating conditions at the Midvale and Cambria properties so as to facilitate the taking over of the active management when the transaction shall have been ratified by the stockholders of the respective companies."

Should Test Value of Cost System

THE value of a cost accounting system as an aid to management can be measured by the promptness with which costs are compiled and presented, and this demand for prompt presentation has brought about the use of standard or predetermined overhead rates. With such rates as a basis, production costs can be obtained immediately on the completion of the manufacturing operations without the delay involved in holding up their compilation until the close of an accounting period, when the overhead expenses would be distributed and the actual rates obtained. These actual rates, however, should be used to check the accuracy of the pre-determined rates which have been in force and to indicate to what extent they can be relied on.

Dangerous Practice

Innumerable cases are to be found where arbitrary rates have been in use for a long time without any attempt having been made to prove periodically their correctness or reliability. This practice is a very dangerous one, as it gives results which are based purely on guesswork, whereas a very slight amount of additional clerical work in summarizing the overhead applied on the basis of the rates in current use would immediately indicate the accuracy with which overhead was being applied.

One of the difficulties—and a very serious one—that has been met with during the past year or two is that, during periods of low production, overhead rates which are sufficiently high to absorb all the factory expenses result in excessive production costs as compared with costs obtained when plants are being operated at full or normal capacity. This is particularly annoying when the prices to be obtained for manufactured goods are in general lower than in times of high production, and it is now becoming generally accepted that the most satisfactory way to overcome this difficulty, from the point of view of price-fixing and cost determination, is to charge to the product only the proportion of the total overhead that the current production bears to the production when the factory is operating at normal capacity.

Distributing Expenses

To illustrate this idea more clearly let us think of a business consisting of two separate factories, A and B. Normally the products of Factory A would be charged with overhead sufficient to absorb the total expenses of that factory, and the same conditions would apply to Factory B. In view of general business depression, however, it is found necessary to close down Factory B, and to carry on manufacturing in Factory A only. Although Factory B has still to carry insurance, taxes, depreciation, rental and other expenses, these charges have nothing to do with the cost of production in Factory A and would not ordinarily be included in the overhead applied to the products of that factory, but would probably be written off direct to profit and loss account. In the same way, the carrying expenses of unused capacity in a single plant should not be charged to current production, but should be charged to an account which might be called "unabsorbed overhead account" and closed out at the end of an accounting period direct to profit and loss.

Unabsorbed Overhead

A consideration of overhead along these lines involves, therefore, the preparation of departmental rates on the basis of normal plant capacity, and the modification of these rates when production is below normal rates. Unabsorbed overhead is charged to the account of that name, but it is not advisable to carry over balances in this account from one year to another. The amount of such balances charged direct to profit and loss account will be an indication of the expense of unused plant capacity, and this information should be very valuable from a managerial standpoint. At the same time, the overhead charged to the product will give truer costs, and in periods of varying production will result in more reliable figures of comparative costs.

In establishing pre-determined rates these will be more accurate if calculated on the basis of actual expenses over as long a period as possible and when production is more or less normal, as the effect of minor fluctuations will then be eliminated. As explained in a previous article the factory is first of all divided into production centres or other suitable divisions depending on the nature of the manufacturing processes and the machinery and equipment in use. There will be normally both direct and indirect departments, or as they are sometimes called, productive and non-productive departments. Direct or productive departments are those in which material is subjected to actual operations forming a part of the process of manufacture. By indirect or non-productive departments are meant such sections as the power-house, tool-room, pattern shop, stores, etc., where no direct operations on the raw material of manufacture are performed.

Strike Equitable Basis

Actual expenses as obtained from the various factory expense accounts are then distributed to the direct and indi-

PROPER CHUCKING ENSURES ADDED PRODUCTION

(Continued from page 32)

hold the end shields for electric motors, and in this case, the overhang is 5¾ inches from the chuck face. The chuck itself is 15 inch size, so all things considered, this was an ideal way of getting over the holding of a peculiar shaped part.

Having shown several applications of good chucking practice, we will summarize several facts which should be remembered.

When gripping work of a frail character, do not attempt to put all the gripping power on the casting itself. Use the jaw chucks as a means of centralizing the part, but have some form of a pull back arrangement to grip the face of the work, thus avoiding distortion.

When parts extend a long way out from the chuck it is often advantageous to bolt a bell chuck to the face of regular chuck. In this way the work can be supported and gripped at three or four more additional points.

In chucking square objects, remember that the application shown at Fig. 5 is often better than using a four-jaw chuck.

Central Location Plugs

That a high degree of concentricity can be obtained by means of central location plugs, or external rings, depending upon the nature of the piece to be machined.

That irregular shaped parts can be successfully held by means of special jaws, and that this method is usually less expensive than the making of special holding fixtures.

Last, but not least, that the chuck is a vital aid or hindrance to production, depending upon how it is used, and it is therefore worthy of close attention and consideration.

SHOULD TEST VALUE OF COST SYSTEM

(Continued from page 50)

rect departments on as equitable a basis as it is possible to determine. For instance, depreciation, insurance and taxes might be distributed on the basis of the investment in equipment in each department; power-house expense on the average horse-power used; repairs on the basis of actual cost to departments; and miscellaneous and general factory expense in proportion to the number of employees in each department, or to the direct-labor hours or direct-labor cost, or again in the proportion that all other expenses have been distributed to departments. The expenses of indirect departments are then distributed to direct departments in the ratio of the services rendered to each of the latter, and from the records of departmental labor costs, labor hours, or machine hours, it is a straightforward calculation to obtain departmental overhead rates for each of the direct or productive departments.

Toronto.—Lillibridge Oil Burners, Limited, Toronto, are incorporated with $100,000 capital to manufacture and deal in furnaces, stoves, ranges, boilers, and sanitary equipment.

Birmingham Motors, Limited, Peterborough, it is announced in Canadian Gazette, have been adjudged bankrupt. This enterprise was promoted largely in Peterborough and vicinity and received the support of local capital.

One firm is said to have exported five full ships of lumber in the last few days, and several others are taking cargo before the severe weather sets in. It is reported that Price Bros. will double the capacity of its mills in the Lake St. John district. The work will start early next spring.

Montreal.—Assurance of French official support for the exhibition train of Canadian products which is to tour France next spring, has been obtained by Senator Charles Beaubien, of Montreal, from President Millerand, according to a despatch received here from London. The French railways are to give free passage to the train, and a stationary exhibition will be arranged in Paris after the tour.

News From the Industrial Field

Parker Motor Car Co., Montreal, has taken over the Montreal Vehicle Motor Co. W. H. Parker, vice-president and engineer, says the company will build and deliver 2,000 cars for 1923.

Construction work on the new city hall building at Kitchener, Ont., will be in the hands of P. H. Secord & Sons Construction Co., of Brantford. The estimated cost of the structure will be about $253,000.

Steel work on the new office addition to be built on the the Montreal Tramways building on Craig St., Montreal, has been awarded to the Dominion Bridge Co. The structure will cost about $125,000.

The total cost of the bridge to be constructed at Ile Perrot, Que., for the dominion and provincial governments will be approximately $260,000. Work on the superstructure will be carried out by the Dominion Bridge Co. at a cost of about $125,000, the remainder of the work being awarded to the Dufresne Construction Co.

Sault Ste. Marie.—Although the Algoma Steel Corporation have only one blast furnace in operation at present, the fact that men are at work relining other blast units is taken as an indication that there is to be an early resumption of activities at the plant. There are good supplies of coal, of which there was a recent shortage.

Sarnia.—Indians of Sarnia reserve are being enriched by the payment of $200,000 by the Dominion Alloy Steel Corporation, Limited, for their site, on reserve property, upon which they propose to erect their steel plant. About $100,000 is being retained in trust for the Indians by the Department of Indian Affairs at Ottawa. The next step towards the development of the plans of the Dominion Alloy Steel Corporation, now that the transfer of the reserve land is completed, will be to survey and clear the river front property.

Vancouver, B. C.—What is supposed to be the first automatic electric railway substation in Canada will be installed here by the B. C. Electric Railway Co., to cost $65,000. The action of automatic substations is described as being almost human. Whenever the voltage on the trolley wire drops as a result of a heavy load, such as occurs when a large number of street cars begin to climb a grade, the substation automatically starts into operation. When the voltage is restored to normal, the machine returns to rest.

Milton Foundry, Machine & Tool Co., Milton, Ont., reports good business at present. They are working on the iron and steel work for a large brick dryer for Milton Pressed Brick plant at Streetsville.

Milton, Ont.—P. L. Robertson Screw Co., are adding a new wing to their present factory to be used as office and warehouse. Their heating system will be changed to fuel oil. The office will be heated electrically.

Milton, Ont.—Milton Shoe Co.'s factory, closed for two years, has been bought by the Milton Worsted Yarn Spinning Co. They are now busy making alterations to suit the new industry, as they have outgrown present premises.

William Cowan, Sr., founder of the Cowan Co. of Galt, manufacturers of wood-working machinery, and for many years president and directing head of the company, died early this week at his home in Galt, at the age of 82 years. He had only been ill for a short time. Mr. Cowan was born at Blochmhor Farm Waterloo Township, not far from Galt, and has been a resident of that place all his life. He graduated from college in Toronto as a veterinary surgeon and practised this profession for several years. On retiring from this business many years ago he took an active part in organizing the company that now bears his name. He was actively associated in politics and different phases of social and business life, and up to the last was an active member of the Galt Board of Trade.

Speaking of machine tool prospects, a Montreal dealer states:—"Demand for machine tools for the past three or four months shows considerable improvement over any similar period within the last two years. As to railroad buying, the G. T. R. has purchased considerable equipment for Battle Creek Shops, and the C. N. R. have made purchases for various shops."

Montreal.—P. Ackerman, electrical engineer of the Shawinigan Water & Power Co., has perfected an invention that has to do with relay protection making long-distance transmission of high electric power safer and more effective. Much interference with service was caused by lightning, wind or sleet storms. By the new method, a faulty section is disconnected automatically. Long distance transmission has been made safer and more effective.

Milton, Ont.—Second floor of the Dominion Express building will be fitted up as a hosiery mill by a Toronto firm, who will occupy it by the New Year.

Fort William.—Twenty-five carloads of machinery are being installed in the plant of the Fort William Paper Co. This equipment is from Dominion Engineering Works, Montreal. The wood mill turns out 120 tons of ground wood pulp a day, while the paper mill turns out 800 feet of paper a minute. It will operate shortly with a capacity of 160 tons a day.

Sault Ste. Marie.—That an old established English firm, using steel in its articles of manufacture, is in prospect for this city, was recently announced at a meeting of the Board of Trade. Another proposed industry was American and used the products of pulp mills. There is some prospect of the Government coming to an immediate decision to extend a railroad into the Mississauga forest reserve.

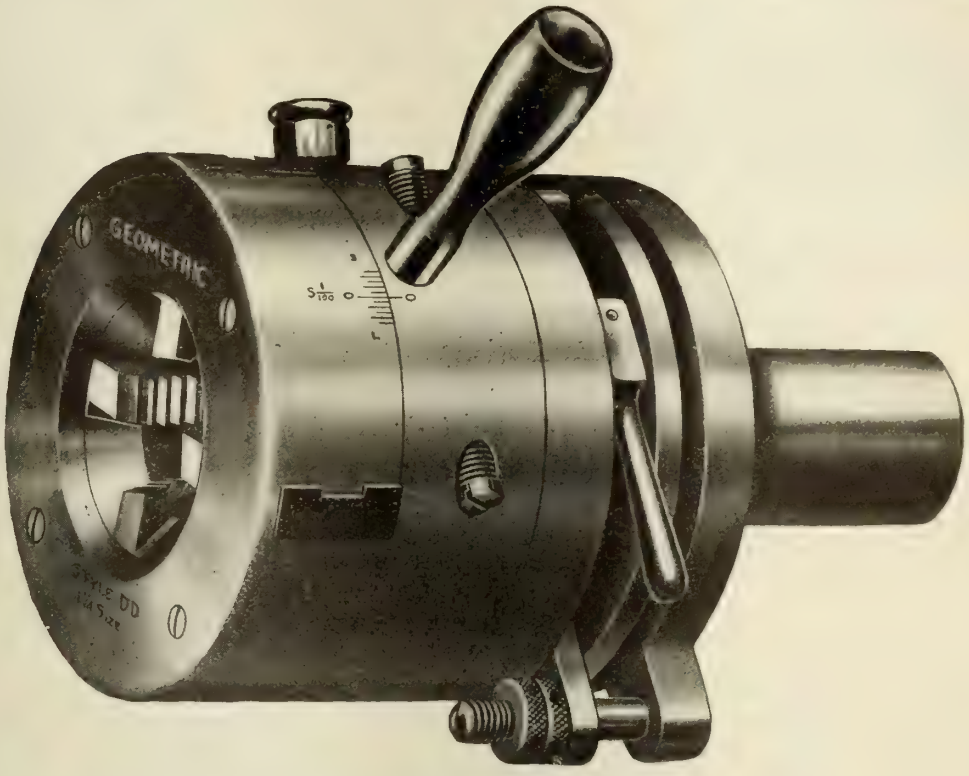
Something new in equipment for handling coal at a pit head is being built by a British firm for a colliery in that country. The plant is operated by hydraulic power and it includes specially designed cages for loading and unloading the tubs in which the coal is conveyed. The action of charging and emptying the cages is done automatically by hydraulic machinery. The special feature of this equipment is that the whole of the operations are controlled from a central point. All the pumps, rams, accumulator castings, steel structures, and other parts of the equipment are being designed and produced at one factory.

Windsor.—Michigan Steel Corporation will build a modern six-mill sheet steel plant on a 35-acre site along the river Rauge, opposite the property of the Canadian Steel Corporation at Ojibway. Detroit is the largest market in the United States for steel used in the production of motor cars and it is proposed that the new plant will largely take care of this demand. The directors of the new corporation are:—B. Lovejoy, New York, of the firm of Wheelock & Lovejoy, chairman of the board of directors; George R. Fink, formerly with the West Penn Steel Company of Pittsburgh, president and treasurer; Frank H. Jones, New York, of the Worthington Pump and Machinery Corporation, vice-president, and W. H. Steel, Detroit, formerly with the Newton Steel Company, Newton Falls, Ohio, vice-president.

A WELL-BALANCED DIE HEAD

Geometric Style DD
For Hand Operated Turrets

Yields to Adjustment
Resists Inaccuracy



Faulty Turret adjustment is common and causes serious trouble in cutting Screw Threads. The Geometric Style DD Die Head for Hand-operated Turrets, with its compensating spring mechanism, not only functions perfectly itself, but overcomes any inaccuracies of adjustment of the Turret.

The Die Head yields as it comes in contact with the work, allowing the Chasers to start the thread properly.

In perfecting a Die Head for certain Automatic Screw Machines, features were developed that made the Die Head quite as desirable for Hand-Operated Turrets, and as a result the Style DD for Hand Operated Turrets has been added to the Geometric Die Heads that have just the right features for the varied requirements of machine and work.

Latest improved equipment is telling the story of production in busy shops.

Quebec:—Extraordinary activity is reported in lumber this year in Northern Quebec, exportation making a record.

Sault Ste. Marie.—The Robert Johnson Motor Co. Limited, have secured a charter, with $100,000 capital, to manufacture and deal in engines, boilers, power plant and hydraulic equipment of all kinds.

Toronto.—The Radio Valve Co., Limited, have been incorporated with $150,000 capital to produce and market thermionic valves of every kind and electrical radio, mechanical and automotive apparatus.

Montreal.—Boiler Equipment Company, Limited, are incorporated with $50,000 capital, to manufacture and market steam boilers, tanks and internal combustion engines, as well as contractors' equipment.

Discussing the passing year's business in farm implements, a manufacturer states:—"Sales during the year just closing have been greatly curtailed by the limited buying power of the farmer, but we are hopeful that this condition will gradually improve and the demand for our product will be correspondingly increased."

Fredericton, N. B.—Receipts from license fees under the Motor Vehicle Act in New Brunswick during the fiscal year which closed on October 31 last, amounted to $302,200. This is the largest in the history of the province, and compares with $276,000 collected last year. While complete figures had not been tabulated as yet, it is said there were approximately 16,000 automobiles and trucks registered in the province last year.

Fort William.—Several thousand bushmen will be required by the lumber manufacturers of Ontario west of the Great Lakes this winter, according to the Employment Service of Canada. Several hundred men are being sent to these camps each week and the demand is becoming more and more insistent. Depletion of stocks during the past summer, owing to heavy building demands in Eastern Canada and the United States, is responsible for the camps being put back on full strength.

J. J. Riley, general manager of the Flint Varnish and Color Works, Toronto, states that November was the best month in the history of their business in Canada, both from a production and sales standpoint. This was largely due to development which had taken place in their plant on lacquers and enamels, which, heretofore, had to be imported from other countries. Considerable research and experimental work had been carried on for some time, and they are reaping the benefit of this work. They are erecting an addition to their plant.

RECORD CAR LOADING

Reports from the carriers of car service division of the American Railway Association show that for the week ended November 18, for loading of all commodities totaled 969,094 cars, the heaviest in the history of the American Railroads for this time of the year. This is an increase of 178,731 cars, or about 23 per cent., over the corresponding week last year and an increase of 79,956 cars over the corresponding week in 1920. This also was an increase of 15,185 cars over the week before, when, however, car loadings declined owing to the observance of Armistice Day as well as Election Day.

Coal loading for the first time since April 1, when the miners' strike began, exceeded 200,000 cars in one week, the total for the week of November being 205,024 cars. This was an increase of 16,712 cars over the week before, and an increase of 36,586 cars above the same week last year, but 11,298 cars below the same week in 1920.

Coke loading totaled 12,431 cars, 158 in excess of the week before. While this was an increase of 5,967 cars over last year, it was a decrease of 1,194 under two years ago.

Ore loading totaled 32,780 cars, 6,603 below the preceding week, but 24,445 cars above the same week last year. Compared with the corresponding week in 1920, this was a decrease of 4,894 cars.

Magnetic chucks are very efficient for holding small pieces for grinding, as the entire face of the chuck can be covered with such parts, thereby supporting each other firmly, so that a large number can be machined at one time, resulting in a much larger production than would be possible by handling the pieces separately.

An important adaptation of the air atomizer and one which is attracting increasing attention, is the oil burner for heating residences. Several burners have been placed on the market recently, some using kerosene, others capable of burning oil as heavy as 20 deg. Be. without preheating. They usually operate with electricity, a motor driving a pump and fan. The pump takes the oil from the storage tank and forces it under moderate pressure through the burner. The fan supplies the air for atomization.

Ford Co. to Use Direct Motor Drive

REPLYING to a request for confirmation of certain reports relative to the proposed addition to the Canadian Ford plant at Ford, Ont., and to the motorizing of their machinery, W. R. Campbell, vice-pres. and treasurer of the company, writes as follows to Canadian Machinery:—

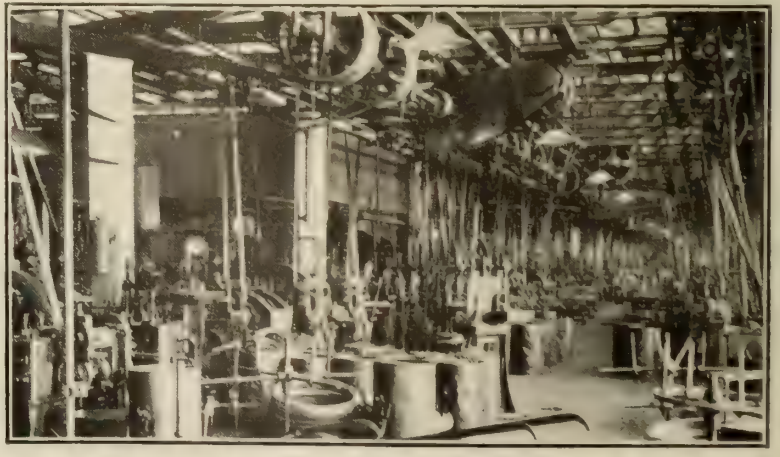
"You have been correctly informed regarding the policy adopted by this company of eliminating overhead transmission and adopting direct motor drive.

"In this connection you are possibly aware of the fact that we have just let a contract for a new factory with floor space of approximately 625,000 square feet, of one-story steel construction.

"We have for some time past, been considering the direct motor drive and have now definitely adopted this policy, due to the fact that the steel structure of the building can be greatly simplified and cheapened by eliminating the necessary load for overhead transmission.

"It will take us some months to complete the operation of motorizing our plant; at the present time we are not in a position to furnish details. An order has been given to the Westinghouse Company of Canada, however, for necessary D. C. motors of a type similar to those used by the Ford Motor Company, Detroit, for similar purposes.

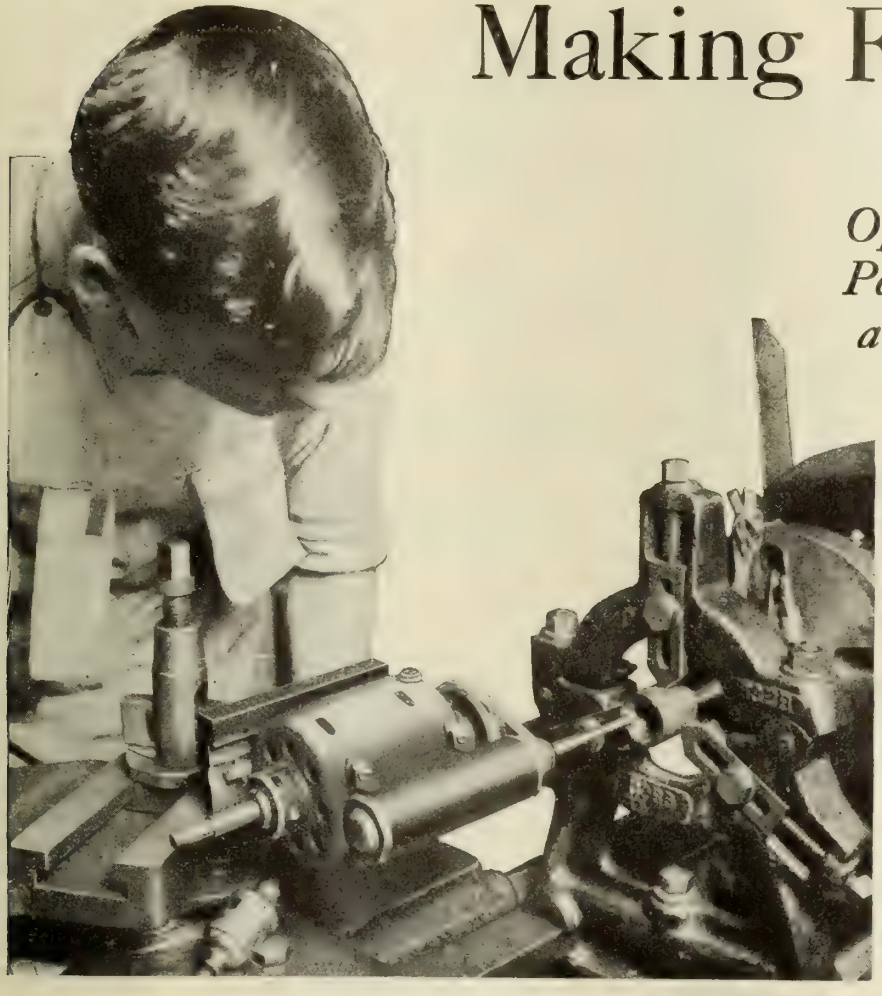
"There are a great many reasons for taking the step which we have, and which, of course, must be quite obvious. The plant which we are about to erect we hope will be in operation by May or June of next year."



Section of machine shop of the Ford Motor Co., of Canada, Walkerville. Motor drive, similar to that in the Detroit Ford plant, is now being introduced.

Making Fine Tools

An Interesting Operation, Economically Performed by Means of a DUMORE Grinder



This photograph — taken at the City Engineering Company's (Dayton, Ohio) plant shows a Dumore Grinder finishing the main shank and head of a special draw-in collet. There were 500 put through in this special lot and the time for the operation shown averaged 8 minutes per piece.

The second operation; grinding the internal face of the collet nut, was also performed by this convenient precision tool.

Dumore Grinders are popular here as in every plant where fine tools are made. Their accuracy makes them useful for the finest finishing work; their simplicity and convenience make them practical for many difficult, almost inaccessible jobs.

Dumore Grinders transform any lathe into a precision grinder; they make fine finishing possible in every machine shop.

May we tell you more about them?

QUEBEC SCRAP TO AMERICAN POINTS

QUEBEC.—Altogether, ten cargoes of scrap iron were shipped during the month of September and October from the port of Quebec. Each of these cargoes, of approximately 1,500 tons, were gathered on the east and north shores of the St. Lawrence by men engaged in the business. Two cargoes were loaded from the Levis side of the river and the other eight from the Louise docks on the Quebec side.

Vessels engaged to handle the scrap were chiefly lake steamers. They took their cargoes to Buffalo, Niagara, Cleveland and other United States lakeports. The material varied greatly in quality, size and species. Part of it was acquired from the railway shops and Quebec foundries, and quite a tonnage consisted of discarded rails from the lines of the different railways.

One steamer from Quebec, during the latter part of November, was loaded with approximately 2,000 tons of railway steel rails and cleared at the customs house for Cuba. Inquiries elicited the fact that the scrap dealers who had purchased and shipped the cargo, had sold out, in advance, these rails to Cuban planters whose plantations were distant from the centre of population, and who were building railways to connect with shipping centres.

Shippers of the scrap iron were non-communicative as to the prices they paid for and the profit they expected to make on the scrap. It may be that they had not cleaned up all the scrap available and preferred to be cautious, fearing competition.

The Eastern Canada Steel and Iron Co., Quebec, has just been awarded the contract to furnish the fabricated steel for improvements to be made to the Louise docks by the Quebec Harbor Commission. Plans mean a change in the accommodation and landing of passengers arriving by the C. P. R. Empresses and others of the company's ocean liners at the opening of navigation next spring. In future, the Canadian Pacific liners, instead of docking in line with the Louise docks breakwater pier as has been the custom, will come into the St. Charles river and dock in line with the north embankment pier. The change will call for extensions to shed 28 and the building of overhead bridges for which the Eastern Canada Steel and Iron Co. have been awarded the contract.

Numerous fires which have included the destruction of churches and colleges in this province are destined to create a boom in fireproof building in which steel and concrete will form component parts. Heretofore, all buildings were built of wood, brick and granite, with the interiors all finished in wood. When fire broke out, buildings were either totally destroyed, or so badly damaged that rebuilding was out of the question. Losses have been such that the authorities have decided to have wood replaced by steel and concrete. The example, without doubt, will be followed by many investors in new buildings. This will eventually mean lower rates of insurance than have generally obtained in this city and vicinity.

GLUE SPREADER AND MIXER

Corbett Foundry and Machine Co., Ltd., Owen Sound, have designed and built an improved vegetable glue spreader and mixer to meet the requirements of the Canadian furniture and woodworking industry. The spreader is belt-driven through machine-cut gearing, and it is claimed, is practically noiseless, and proof against leakages. The rolls are steel corrugated for the proper and uniform spreading of the glue. The desired thickness of glue to be spread is controlled by the use of roll scrapers, which revolve intermittently while the machine is running. All necessary adjustments can be made while the machine is in motion. All the parts are accessible, gearing is guarded and the machine has a maximum capacity for two-inch material. It is made in width from thirty-one inches to eighty-four inches.

The glue mixer and cooker is of the double agitator type, that is, two sets of paddles in the inner kettle, running in opposite directions, thereby ensuring a perfect and uniform mix. Made in capacities from thirty-seven to seventy-five Imperial gallons. Each mixer is fitted with water gauge glass and steam safety valve.

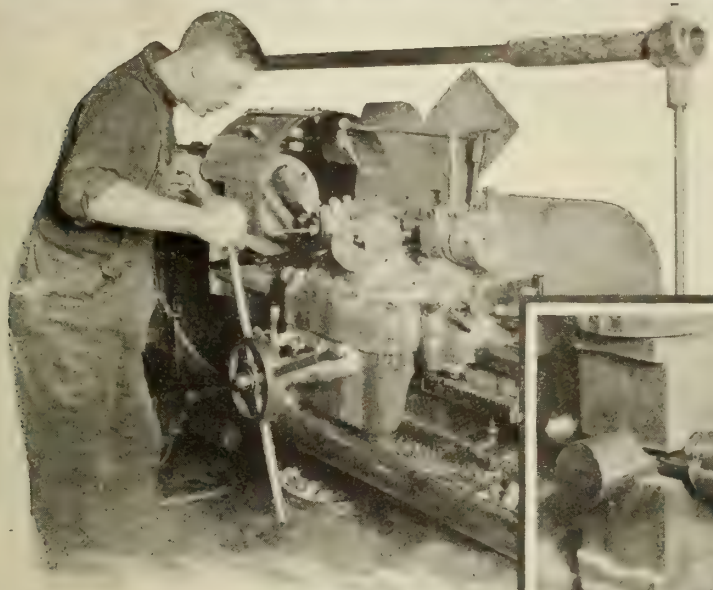
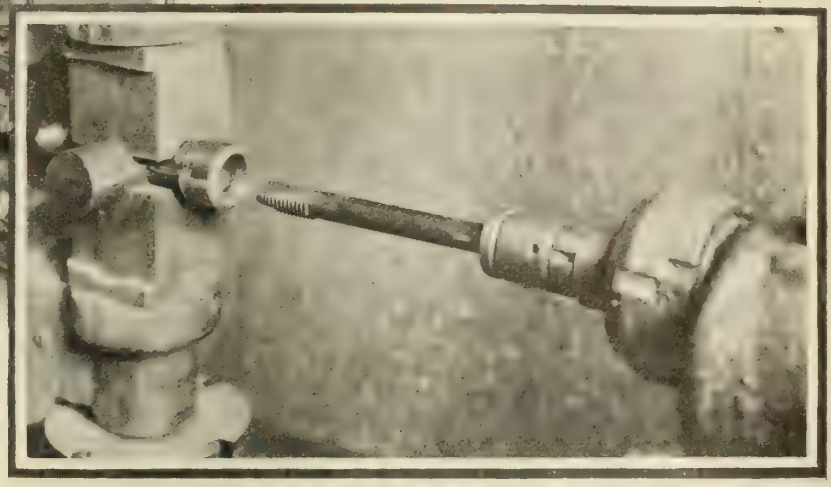
Little Stories of Real Production



Will a "Gun" Tap Stand Punishment?



Steel Forgings 5 Seconds per hole 500 Holes per Grinding!

They say that "in the dark all coons look alike," and doubtless in a catalog or showcase it's hard to see the difference between the *original* spiral-pointed tap (the GTD "GUN" Tap) and an ordinary spiral-pointed tap which copies the *appearance* of a "GUN" Tap.

But out on the job—against the cold light of production demands—"GUN" Taps stand out by the way they stand "punishment." On the J & L pictured above, a "GUN" Tap is used to tap a 5/8 in. hole 1 1/8 in. deep (eleven threads) in a forged steel compressor drum. This tap, working under severe strain (5 seconds per hole), was selected after many ordinary taps had failed, and for four years has justified the confidence of a well-known New Jersey concern (name on request).

The "GUN" Tap, famous for its easy, shearing cut, freedom from clogging and breakage, and its sustained accuracy, will surprise you by outlasting several ordinary taps. On this job, 500 holes are tapped before regrinding—and it's good for an indefinite number of grindings.

Remember the "GUN" is the *original spiral-pointed tap*. Its superiority is characteristic of GTD small tool service all along the line.

"MapleLeaf"
BRAND
Stitched Cotton Duck Belting

More Power At Less Cost

This is possible if you use ONLY "Maple Leaf" stitched cotton duck belting. It has a positive gripping surface which hugs the pulley. Costs less than leather, rubber or balata.
Once you use "Maple Leaf" belting you specify it always for it is the NO TROUBLE belting which helps production. Write us for samples.

Ask Your Bank Manager—

if you would find the Financial Post of real benefit to you

He will tell you that THE FINANCIAL POST is Canada's leading financial and investment newspaper; that it will solve your investment problems, save you from loss and analyze business conditions for you.

He probably reads and enjoys THE POST —2,200 Canadian bank men do—and will tell you how THE POST can help you.
Or if you want to subscribe now to this valuable weekly newspaper of news and views of business and investment send $5 to-day.

THE FINANCIAL POST TORONTO 143 University Ave. - - CANADA

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

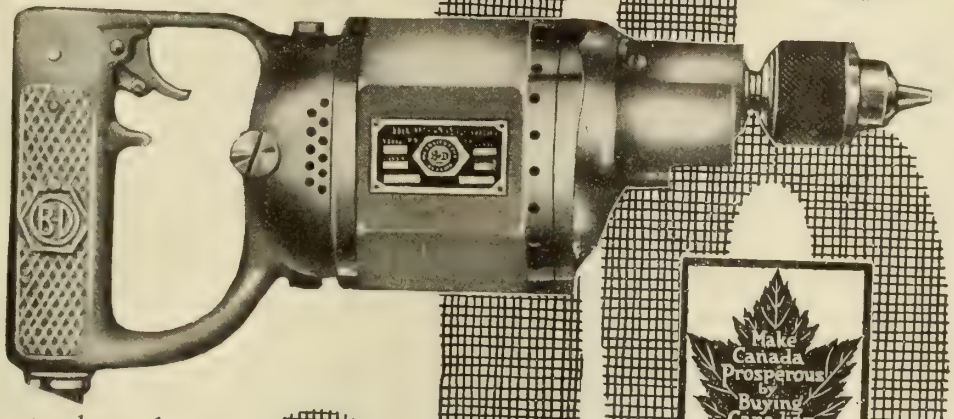
BLACK & DECKER

¼ inch PORTABLE ELECTRIC DRILL

"With the Pistol Grip and Trigger Switch"

Price reduced to
$36.00
was $49.00



Owing to the large demand for the Black & Decker Quarter-Inch Portable Electric Drill our production on this unit this year has been practically trebled. This has enabled us to reduce our manufacturing costs, and in accordance with our established policy we are passing the saving on to you.

This is the standard Black & Decker Quarter-Inch Drill, exactly the same as has previously been sold for $49.00 except that it has been improved by the addition of a geared-nut chuck instead of a hand operated chuck.

A new folder describing this unit in detail, INCLUDING SPECIFICATIONS, is yours for the asking.

Guaranteed by

LONGEST SERVICE

We make these three right.

1. Exacting analysis of the physical and chemical properties of our steel insures a uniform product.
2. Intelligent workmanship constantly striving to produce the better tool yields the Pratt & Whitney quality.
3. Rigid inspection of the work in process and of the finished product guarantees tools for longest service.

The finished product must be right

When you are in a jam on your cleaning work-

TELEPHONE or telegraph to the nearest Oakite Service Man. He will come—quickly—armed with a 14-year experience on all kinds of cleaning jobs in all kind of plants. And he will clear up the situation just as effectively as an Oakite Service Man helped this wrench plant out of trouble.

Production was at a standstill. They could not get their wrenches clean enough so that the japan would stick. The wrenches were piling up all over the shop.

In desperation they used a japan "thinner," and managed to sufficiently remove the burned-on quenching oil so they could put through a few wrenches. But this method was too impractical and costly.

Production

has stopped in some plants when their cleaning department fell down. Oakite cleaning methods have pulled many plants out of a bad fix.

The superintendent had heard of an Oakite Service Man getting a neighboring plant out of much the same sort of a jam, so put in a hurry call for him.

With no change in equipment, and by swinging over to Oakite cleaning materials, the wrenches immediately started coming through with a surface so clean that the japan takes perfectly.

There are many tough cleaning jobs that are to-day running along smoothly because Oakite materials are used. If you are getting rejects in your shop after japanning or plating, stage a competitive test between Oakite materials and whatever you are using. If you can't clean your work better, faster, and for less money with Oakite, it won't cost you a cent.

Ask one of our experienced Service Men to call. There is no obligation.

Resident Canadian Representatives: Mr. C. P. Murphy, Toronto, and Mr. C. Burgin, Montreal.

For Making
Perfect
Screw-Thread Joints

SMOOTH-ON

ELASTIC CEMENT NO. 3

A screw-thread joint made with Smooth-On Elastic Cement No. 3, will not leak, because the Smooth-On expands in metallizing and so closes up any defective places which otherwise would cause leaks; yet, the joint may be taken apart when desired.

Smooth-On Elastic Cement No. 3, is sold ready for use in paste form. It is applied to the screw-threads with a brush. Especially useful for high pressure steam or water joints, for ammonia joints, for coating flanged joint faces and for coating gaskets.

Send for our NEW Small Size Instruction Book No. 19. It illustrates and describes how to make perfect screw-thread joints and hundreds of other repairs. You will marvel at its contents. The book is FREE.
Smooth-On Elastic Cement No. 3 comes in 5 lb., 10 lb., and 25 lb. tins. Also in larger sizes.

the basis of hack saw economy

No. 1
COMPOSITION OF BLADE

Any discussion of the merits of a hack saw leads straight to the first step in its manufacture—the composition of the blade itself. Here the maker is confronted with a situation which at best is a difficult one. Briefly, it is this. One metal, to successfully cut another, must be considerably harder than the opposing metal. Yet as the hardness increases—so does the brittleness, and a hack saw blade that is excessively brittle will not stand up in actual service.

Repeated tests have shown that the best grade of hack saw steel, such as is used in Starrett Hack Saws, contains approximately 0.90% carbon content, 1.25% tungsten and about 0.25% each of manganese, chromium and vanadium. The percentage of carbon gives a hard blade with great cutting speed, while tungsten adds to the blade the ductile strength necessary for satisfactory wear under the hardest usage.

Good Hack Saw Steel should contain approximately:	
Carbon	0.90%
Tungsten	1.25%
Manganese	0.25%
Chromium	0.25%
Vanadium	0.25%

The other elements mostly affect the depth to which the hardening penetrates through and beyond the teeth of the blade.

Heat Treatment and Tempering

Heat treatment adds a great deal to the efficiency of a hack saw blade. The heat treatment of each Starrett Hack Saw gives the exact quality that best suits the conditions under which it is to be used.

Naturally the degree of temper varies with the material to be cut, but a uniformly tempered blade is always hard and tough and has a surface that will not shell off.

Effect of Abuse

More saws break than wear out. Using a hard tempered blade for metals which should be cut by a soft blade is probably the most common cause of breakage that exists. On the other hand a soft blade similarly misused dulls rapidly and wastes the workman's time.

Knowing vs. Guessing

The one sure way to cut different metals and shapes *economically* is to use blades of recognized high quality and use each hand or power hack saw blade on the metal it will cut best. The L. S. Starrett Co., makers of unexcelled Hack Saws, has prepared a chart which makes proper blade selection a *certainty*. It shows at a glance just what blade to use for cutting any metal and shape. Its use eliminates the most common cause of breakage and will help you reduce cutting costs by reducing to a minimum the cost of every cut. The L. S. Starrett Co. will send copies of this Hack Saw Chart free on request to any user of hand or power hack saws.

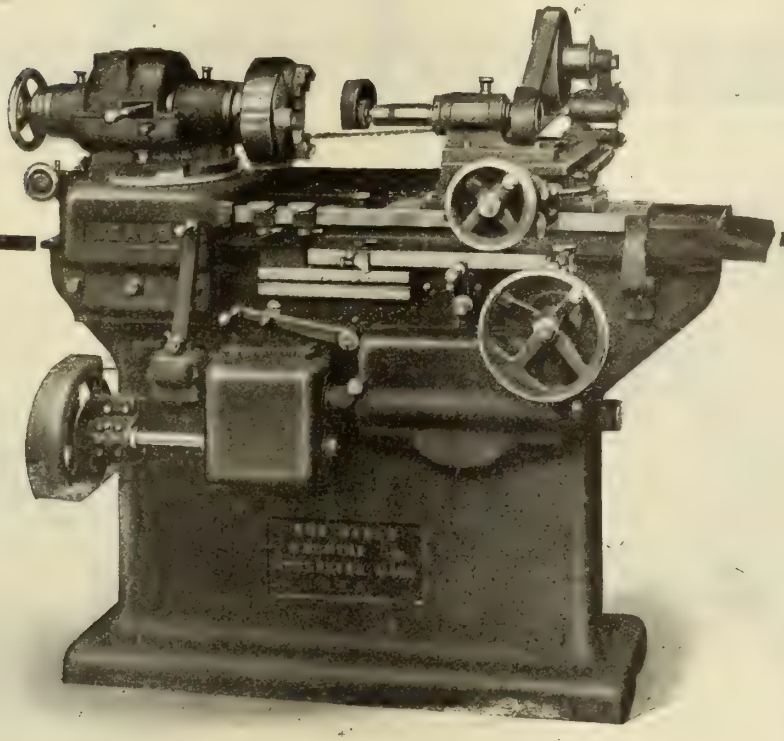
INTERNAL GRINDING

For Medium Size Work With Straight or Taper Hole



THE Heald Style No. 70 is a manufacturing machine in every sense of the word, designed from the ground up for the internal grinding of absolutely round holes, straight or tapered, in such parts as bushings, cylinders, gears, gauges, cones, etc.

It is as rigid and massive a machine as can be built, with the iron properly distributed to absorb any vibration. Instantaneous changes of speeds and feeds, together with centralized control of all the levers give the operator every opportunity for finish and production.

At the same time, with its many sizes of wheel heads which are instantaneously interchangeable and all the various attachments which can be furnished on order, it becomes almost a universal internal grinder.

It is particularly desirable in tool rooms where nearly all the work is hardened and requires extreme precision. You can get a mirror-like finish to any desired accuracy.

Years of experiments with this machine have given our Service Engineering Department a wealth of records on various jobs. We would like to send you data and figures on samples of your work. Write at once. Ship some to-day.

VOL. NO. XXVIII, No. 24. DECEMBER 14, 1922

Assembling Parts By Pressure At The Bench

When the Hammer May be Used to Advantage—Steady Pressure Best for Accuracy—Special Fixtures for Locating to Exact Position—Means of Supporting the Work

By FRED HORNER

THE hammer as an instrument for putting together or dismantling tight-fitting parts now holds a secondary place alongside the alternative of forcing by screw or lever pressure. This is particularly so in cases where injury or distortion of the piece must be avoided. In mere breaking-up processes the thing is to do the job in the shortest time, and blows or pressure are used indifferently, according to which gives the quicker results. Frequently a few smart blows will start a hard fit or rusted joint immediately, and here discretion must be exercised, if hammering can be safely done. In considering the small class of forcing that is practicable on the bench, we are faced with the choice of three methods—the vise, the arbor press, and screws or bolts. Each has a sphere of its own. The vise is very powerful, but slow, and owing to the vertical attitude of the jaws, some articles (with their packings which may be necessary,) are awkward to keep in position. The arbor press offers the advantage of a horizontal surface, and is much quicker in operation. It also provides a greater amount of "daylight" than the vise, and freedom below for the projection of shafts. The bolt method generally comes in for situations where neither of the other appliances are available, owing to the conformation of the work, or because it is partly assembled. And, of course, away from the shop, bolts may play a much more important part, as there might not be any convenient alternative.

Use of the Vise

In the vise, the usual objects dealt with are rods, plates, wheels, gears, etc. that require to have pins or bushings forced into or out of them. The chief aim lies in taking the pressure against the piece in such a manner that distortion, or risk of fracture are not likely. Pressure must be preferably localised around the area of the hole where the pin or bush fits, and not allowed to reach to a rim or other distant part. Risks of the sort just mentioned are thus eliminated, and the pressing becomes more effective. Danger of marking finished surfaces exists, from the serrations on the jaws, and so the packing at the back serves a double purpose. Fig. 1 shows the ordinary disposition of the parts, including packings, for pressing in a bush, and Fig. 2 a plan of the opposite condition, that of extraction. Rear packings (or a tube) with clearance are likewise necessary if a pin or bush requires to be pushed into a rod so as to hang out, instead of lying flush. The assembling of parts such as strips or discs with two or more pins concerned sometimes involves the preparation of a special pad or die to effect an even pressure all over the surface, and at the same time clearing the pins.

Special Pad or Die

Fig. 3 gives such a rig-up where three or four pins have first to be pressed into the bottom plate (A) and then plate B pushed down to a certain distance. The pressing plate, C, enables this to be done accurately, the distance between the plates being ascertained by a gauge or other means. Tube packings of small diameter are useful for taking the pressure at the back of an awkwardly-formed article, liable to tilt more or less out of truth when merely resting against the jaw. The tube just surrounds the hole where the pin is forced in, or rests on an equivalent area, so that the resistance comes in exact line with the direction of forcing. An encircling tube offers advantages for some sorts of pressing, in which close contact

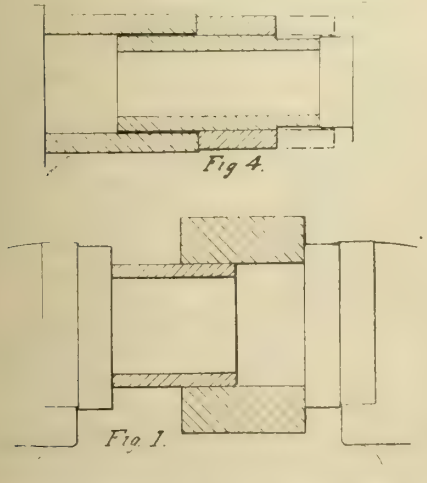

Fig 4—Thrusting bush from ferrule. Fig. 1—Ordinary method of forcing in vise.

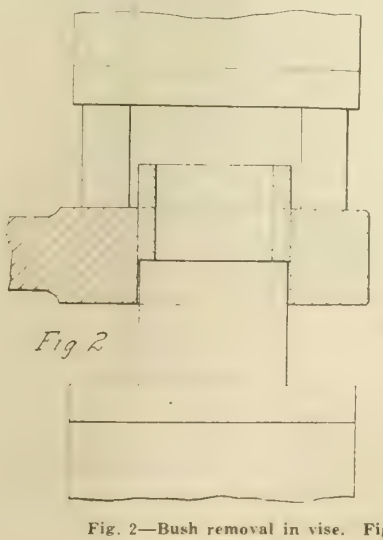

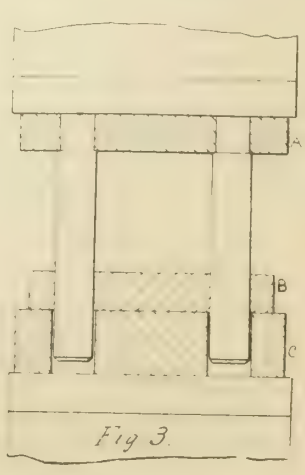

Fig. 2—Bush removal in vise. Fig. 3—Pushing plate down over pins.

without risk of slip precludes the use of separate strip packings. This is evident from Fig. 4, illustrating the pushing off of a ferrule from a bush. A similar arrangement suits for forcing on, with the difference that a reduced support such as drawn at the end would not be necessary. If pressing on to an exact distance, not evidenced by the presence of a shoulder as a guide, is wanted, such distance from the end of the work can be controlled by making the forcing ring of suitable length, so that when the ferrule has been thrust far enough, the vise jaw will come into contact with the end of the work.

Accurate Locating

Besides the limitations imposed on length between the vise jaws, there is also the disadvantage that wheels and other specimens extending out some way from a shaft cannot be got into the vise for forcing, hence the arbor press is preferable in regard to these two points. Methods of ensuring a definite degree of projection depend upon the number of articles to be done. For one, or a small number, the mode of actual measurement of work is sufficient. For batches of pieces, the ram may be fitted with a strongly-clamped ring encircling it above the bearing, and adjusted after the first sample has been pressed. The possible uncertainty, due to the chance of slip of this collar, may be abolished by applying a ring around the pin, after the style drawn in Fig. 5. Shouldered pins, judged by sight as to the flush state of the shoulders, may be pushed a little too far, and then have to be retracted; to avoid this waste of time a close-fitting washer (see Fig. 6) underneath the job will be useful, arresting the shoulder positively. The use of a plate slightly larger than the bush, Fig. 7, is also recommended for flush pressing, in circumstances where the underside of the bush cannot be met and checked by the table or plate.

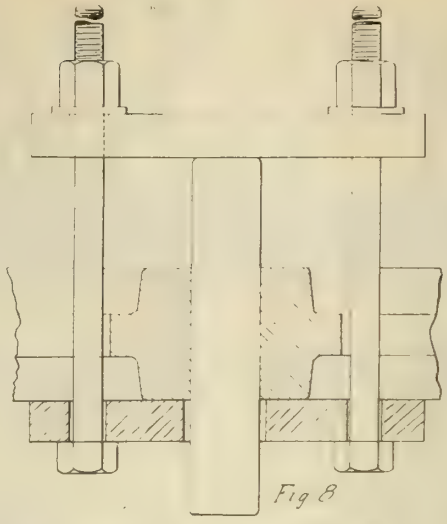

Fig. 8—Rig-up for forcing pin in wheel.

Bolts and plates chiefly come in when large wheels, frames, and so forth cannot be put in the vise or the press. Methods of application are generally simple, comprising a stout bolt and two plates or hair-pin clamps, one spread over the hole at the rear and the other comes against the bush, the nut being tightened until the latter is home. Solid holes in the wheel or arm spaces or apertures in a framing are essential to permit a set-up resembling that illustrated by Fig. 8 to be employed. A like affair can be utilized to force bushes out, interposing a piece of shaft between the top clamp and the face of the bush, the shaft being just small enough to pass into the wheel hole.

Plant executives should encourage the submission of ideas for improvements from the workmen. Employees that are continuously doing certain classes of work are frequently in a position to suggest changes that will facilitate production, and something should be done to stimulate initiative of this kind.

CONDENSITE CELERON IN THE RADIO INDUSTRY

WITH the development and expanding use of radio, condensite celoron and vulcanized fibre hav efound many new uses. Radio transmitting apparatus often demand very high voltages an currents which, at the high rate of vibration or, in other words, "frequency" developed, would soon destroy all but the best insulation. The essential electrical qualities of an insulator are that it shall have high volume and surface resistivity; high dielectric strength, and a low power loss or "phase angle." An explanation of the above terms condenses down to the fact that the insulation must be the best nonconductor of electricity that can be had. Condensite celoron is stated to possess certain mechanical properties that are especially adapted to radio service.

Radio voltages and currents are very much more destructive to insulation than equal voltages and currents used in commercial work. This is due, as stated above, to the high frequency involved. Where very high frequencies are used even the best insulation becomes a conductor of the current. In comparing the electrical qualities of an insulator, the surface and volume resistivity, dielectric strength and phase angle are all interrelated. If the material is of such a character that part of the current will tend to flow through it, or be absorbed by it, then a power loss develops measured by the phase angle, which is another way of expressing in degrees the percentage of power lost. Therefore the resistance which the material possesses to withstand these current leakages is expressed in terms of volume and surface resistivity. Another important property of the material is its dielectric strength or, in other words, the voltage required to puncture the insulation. This last-

Trend of Industrial Employment Is Favorable

Toronto Reports Drop From 14,000 to 5,000—Seasonal Activities Cease, Releasing Large Numbers—Lumbering Operations Create Demand—Official Figures Show Steady Improvement

THAT unemployment to date is far below the record of last year is the report of the government employment services in Toronto. While there were 14,000 out of work at the beginning of 1922, there are at the present time only about 5,000 registered. Absorption during the summer months is shown in that from June to the first of October the number was only 2,000 to 2,500, and that, of this number, there were probably 1,200 listed as handicapped men.

Continued mild weather has made possible the continuation of outside work that would otherwise stop. There is still considerable activity in the building industry, and it is reported that certain contracts on the Welland ship canal will be proceeded with unless extreme weather sets in. The lumbering industry has absorbed several thousand men, while last year there were probably not more than 250 shipped out of Toronto during the season. An unusually large amount of lumber is being cut this year. Wages paid are from $35 to $40 a month, with board and equipment found.

Trained Mechanics Scarce

There is a scarcity of trained mechanics. Massey-Harris Co. have been looking for moulders and core-makers, and are employing girls in the latter department. Foundry wages run from 55 to 60 cents an hour. The demand for machinists is very light, and it is reported that quite a number of the younger mechanics have been attracted to the States by reports of prosperous conditions. In the building trades there has been a scarcity of bricklayers, carpenters and plasterers and conditions have been such as to encourage the development of a considerable number of apprentices.

Farmers have appeared in the labor market in considerable numbers looking for men willing to sign up for the winter. There is some anxiety that when the spring opens, there will be a shortage of this class of work, and farmers are realizing that with prices at their present level, it is a matter of production. During the past season Toronto has cleared 4,745 men for the farm. Of this number 600 were married. There is quite a movement among agriculturists to secure married couples to locate on their farms. In most cases a plot of ground, poultry and some livestock, are made available and it is stated that at the rate of $600 a year a farm hand. under these circumstances, is as well off as a city man with $2,000 a year or better.

Ranks of the unemployed have been swollen by the closing of navigation, by cessation of certain track and bridge activities by the railways, by the closing of summer hotels and resorts, by postponement of highway work and many other seasonal activities. It is predicted that in the spring there is likely to be pronounced labor shortage.

Less Construction

The volume of employment afforded in construction declined largely, over 7,000 men having been let out by employers in these industries. The majority of the workers were released from employment on highways, mainly in Ontario.

The following table shows the index members of employment by industrial groups. Relative weight represents the proportion of employees in the indicated district or industry to the employees reported in all districts or in all industries for the period reviewed:

	Relative Weight	Oct. 1 1922	Nov. 1 1922	Nov. 1 1921
Manufacturing	55.5	86.7	87.7	81.1
Logging	3.1	42.1	66.0	59.7
Mining	5.8	101.1	104.5	98.1
Communication	2.7	102.8	102.2	104.5
Transportation	14.6	114.0	114.7	110.5
Construction	9 3	116.2	153.2	139.9
Services	1.6	102 0	96.6	96.0
Trade	7.4	91.9	93.8	93.0
All industries	10.0	94.6	95.8	90.2

Trend is Favorable

That the trend of employment in the manufacturing industries is favorable is the report based on employment statistics issued by the Dominion Bureau of Statistics for November.

There were seasonal declines in sawmilling operations. Textile factories were considerably busier. In the iron and steel industries, in addition to the revival of activity in automobile plants, there were additions to staffs in shipyards, foundries, heating appliance and machine shops. The production of crude, rolled and forged products, however, declined. Boot and shoe factories and tanneries were decidedly busier, the period under review being characterized by the most marked improvement recorded in the leather group in any one month of the present year. Logging camps reported considerable extension of operations The increase in the personnel registered exceeded those indicated during any month of 1921. Coal mining in both eastern and western fields was much more active, although other branches of the mining industries were slacker. Railway transportation afforded increased employment, particularly in the prairie district. Seasonal improvement was evidenced in the payrolls of wholesale and retail establishments, especially in the latter.

Improvement Over 1921

The volume of employment afforded by some 6,600 firms at the beginning of November showed an increase, thus maintaining the steadily upward movement indicated by employers since April. The working payrolls of these concerns aggregated 785,451 persons or 6,810 more than in their last report, and the index number of employment stood at 95.8 as compared with 94.6 at the beginning of October and with 90.2 on November 1, 1921. Activity in the manufacturing industries as a whole, and in logging, mining, transportation and trade divisions increased considerably; the gains in some case indicated the resumption of seasonal operations. The only pronounced declines recorded were those in sawmills and in the construction industries, both of which were entirely seasonal in character.

All provinces, except British Columbia, shared in the favourable movement. The advances in Ontario and the three prairie provinces, in each case providing work for approximately 3,300 workers, were the most extensive. The gains in the former district occurred very largely in automobile factories, (representing recovery from previous shutdowns), in logging camps and in textiles. In the prairie district considerable improvement was eported in the coal fields and in railway transportation. The declines in British Columbia were mainly attributable to contractions in water transportation, fishing and canning.

How Cities Stand

In Montreal practically no change, on the whole, was indicated by the employers making returns. The level of activity in Toronto was decidedly higher than at the beginning of the preceding month, while Ottawa and Hamilton firms also afforded more employment. In Winnipeg fairly large additions to staffs were registered, mainly in retail stores. The tendency in Vancouver was distinctly downward, contractions affecting over 1,500 workers being recorded by the concerns reporting.

To obtain the best results from tool steel in gage work, it is always best to heat treat or anneal material before using. In this respect it is better to select stock somewhat larger than ordinarily used, as the annealing process renders the outer stock useless to a certain depth, and unless this defect is removed, failure in hardening will result.

Practical Application of Mechanical Oscilloscope

Tuning Down High Speed Mechanisms so That Same Are Visible to Naked Eye—High Tension Current Employed for the Lamps—Use of the "Creeper" Gear

MINUTE visual examination of mechanisms operating at high speed is made practical by the use of a recently developed instrument known as the oscilloscope. A simple mechanical principle underlies the action of the Elverson oscilloscope, and its operation has been perfected after considerable experimenting on the part of the makers, Herbert Kennedy & Co., of London, Eng. Actually the oscilloscope is a commercial and workable application of the effect obtained when moving machinery is viewed in an intermittent artifical light. In such cases, however, the synchronism of moving parts with the frequency of the light flashes is purely accidental, whereas in the case of the instrument here described the results obtained are subject to delicate and accurate control.

Simple Method of Operation

Possibly the best estimate of the wide range of practical applications covered by this instrument will be obtained by first describing the method adopted for obtaining the desired result, and this is in reality remarkably simple. In the first place it must be remembered that the human organs of vision, including the eye, optical nerves, and the area of the brain concerned, require a definite time for operation, so that an impression, however transient, will, if sufficiently intense, occupy a definite period so far as the human capacity for vision is concerned. This period varies in normal cases between 1-10 and 1-5 of a second. In the second place it will be obvious that on account of the above considerations, all except slowly-moving parts of machinery will be invisible to the naked eye, or, at the best, visible only as a confused blur, on account of the multitude of different impressions which are received by the eye within a very short space of time.

If, however, the mechanism is rendered visible for a very minute period of time,

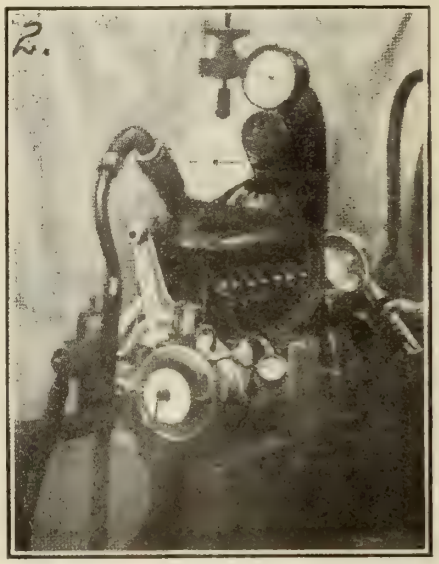

Fig. 2—Oscilloscope applied to automobile engine.

after which comparative darkness supervenes, a definite image will be registered by the brain, whilst if several repetitions of this image occur within a fraction of a second, the effect will be correspondingly intensified as far as human vision is concerned. This briefly is the principle upon which the oscilloscope operates.

Essentially it consists of a special type of electric lamp which may be made to give a definite number of flashes of light per minute, the exact number depending upon the cyclic period of the mechanism which it is desired to examine. Thus the complete instrument comprises the lamp with an accumulator and induction coil and means for interrupting the current and controlling the number of flashes per minute. Considerable experiment was, however, necessary before these requirements could be embodied in practical form, and the equipment finally evolved is shown in Fig. 1.

This shows two lamps provided with shades and suitable holders and an accurately-made gear box, these units being connected up with an accumulator, induction coil, and condenser enclosed in a wooden case. It should be mentioned that the connections are so made that the equipment can be operated only when the lid is in position on the case, thus ensuring protection of the apparatus and of the operator against the high-tension current employed for the lamps.

Gas-Filled Lamps

The lamps are of a special gas-filled type, in which an electric discharge takes place between a point and plate electrode in an atmosphere of neon, these lamps having been evolved as the result of considerable experiment to give flashes of light of great brilliance and of exceedingly short duration. One of the lamps shown is a master unit upon which a control switch is fitted in the form of a spark gap which is rendered necessary by the intermittent nature of the current. This spark gap nullifies the effect of inductance in the lamp circuit, confining reactionary currents to the bulb, so that for a given current the maximum discharge is obtained between the electrodes. Consequently, since one or more lamps may be connected in parallel with the master unit, the maximum amount of light may be obtained from a given current.

Action of Gear Train

On the right in Fig. 1 is shown the gear box, which consists of a graduated circular casing in which two accurately-made gear trains are enclosed. Each of these trains receives its motion from a primary pinion on the central shaft, which is coupled directly to the mechanism to be tested, and each of them drives a contact breaker, which may be switched into the lamp circuit. In the case of one gear train, the speed is so arranged that the flashes of the lamp

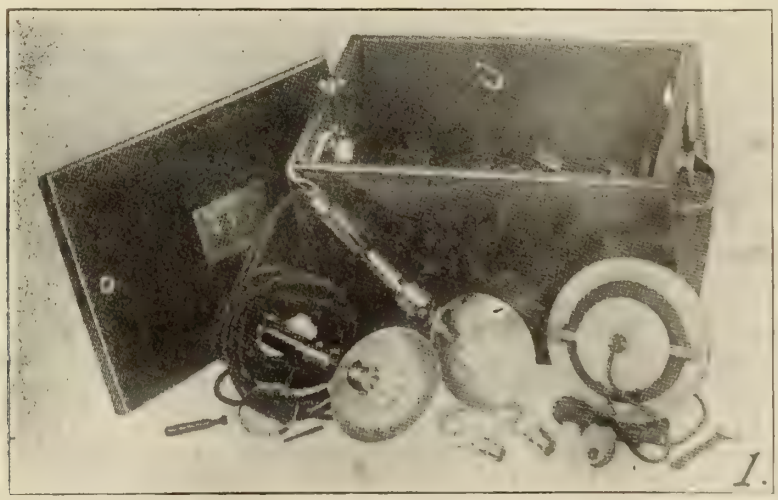

Fig. 11—Elverson oscilloscope and accessories.

synchronize exactly with the revolutions of the primary pinion, whilst in standard sets the other gear train gives 100 flashes of the lamp in 99 revolutions of the pinion. A switch working about the centre of the gear box brings either circuit into operation as desired, or, if required for special purposes, radial slides may be moved by hand to give one, two, or four flashes per revolution with either current.

In the case of the gear train where the number of flashes coincides with the number of revolutions of the primary pinion, it will be obvious that each flash occurs at a particular point in the revolution of the pinion. Thus the revolving member of the mechanism to be tested is illuminated in exactly the same position at successive revolutions, with the result that, if external light is sufficiently reduced, the mechanism appears to be stationary, although in reality it may be moving at a high speed. Similarly all part mechanically coupled to the revolving shaft will be illuminated at definite points in the cycle of movements, so that any mechanism may be subjected to minute visual examination under actual working conditions irrespective of the speed employed.

Apparent Speed Reduction

On the other hand, if the alternative circuit or "creeper" gear is brought into action, successive flashes of the lamp will illuminate the mechanism in positions removed from one another by 1-100 of the cycle, despite the fact that actually the mechanism has passed through 101-100 of a complete cycle during the space of time between successive flashes. This, in effect, means that the apparent speed at which the mechanism is functioning is reduced to 1-100th of the actual speed, so that parts revolving at, say, 1,000 r.p.m. appear to be moving at the low speed of 10 r.p.m., at which speed, of course, visual examination is not only possible, but exceedingly useful, since the actual working movements of the parts are reproduced for inspection.

Typical Examination

If the primary shaft of the gear box be coupled directly to the cam-shaft of an internal-combustion engine, the action of the valve and rocker mechanism may be analysed minutely. Actual tests with the instrument have, in fact, already revealed a number of interesting points in connection with valve gear. Thus in many cases the lag which takes place in the closing of the valve when the valve stem is heated up may be distinctly observed, whilst failures of the roller to follow exactly the cam profile are equally noticeable. In the last-named case the roller may be seen to bounce on the cam and to be accompanied by a corresponding movement of the valve on the seating.

Testing Gear Action

Another important application of the device is in connection with gear testing, since errors in the interaction of two gears are rendered readily apparent. It should, of course, be pointed out that gears which apparently mesh correctly when running at 10 r.p.m. may exhibit several serious defects if the speed be increased to 1,000 r.p.m. or more. When using the oscilloscope, however, the majority of the defects remain apparent, whilst the speed at which the gears are revolving appears to be reduced, in this case by 100 to 1.

Actual tests show that periodic errors due to inaccuracies in circular pitch or lack of concentricity are visible as a slow oscillation of the various members of a gear train, whilst in cases where variable stresses are encountered in the drive the presence of backlash in the gears gives rise to the same visual phenomenon.

Studying Moving Mechanisms

Another important point is the fact that moving machinery may be made to appear stationary at any desired point in the cycle of operations. This is effected by moving the switch on the gear box to the stationary position, after which the complete unit, i.e., the gear box and contact breaker, may be rotated about its axis until the mechanism is observed to be in the desired position. This fact suggests several interesting possibilities in connection with the study of vibration and torsional stresses.

Thus in the case of machinery where an undesirable degree of vibration is apparent it will be found in the majority of cases that the vibration is periodic and synchronous with the movement of one of the main components. Whether this is the case or not may readily be determined by coupling the primary shaft of the gear box to the main revolving members in turn. If then the contact breaker is set so that two or four flashes per revolution are made, periodic vibration synchronising with the movement of the shaft will result in two or more images of the various parts being visible. Further, the planes or points where the amplitude of the vibration is at a maximum may readily be determined by setting the instrument to give two flashes per revolution and then rotating the gear box about its axis until the maximum distance is obtained between the two images. Thus it is possible actually to measure the extent of the vibration, and, in addition, to determine the direction and period of the movement, a factor which should be of great importance when testing high-class mechanisms with a view to improvements in design.

Examining Shaft Stresses

With regard to torsional vibration and torsional stresses in shafts, the method of application is equally simple, and in this case the protractor scale on the rim of the gear box housing is utilized. In the first place, the gear box is mounted in a suitable support, whilst two lines are scribed near opposite ends of the shaft to be tested, the lines being parallel to the axis of the shaft and in line one with the other. The primary shaft of the gear box is then coupled to the member under test, and both are rotated, whilst the contact breaker is switched to the stationary position so that the test lines become visible. Next the gear box is rotated by hand to bring one of the test lines under a pointer which may be attached to any conven-

Calculating the Power Transmitted by Gears

Method of Figuring the Various Classes of Teeth—Point of Application and Degree of Impact—Pinion Tooth Generally the Weaker—Possibility of Load Concentrated at One Point

By CHESTER B. HAMILTON, Jr., B.A.Sc., M.E.

THERE are several methods of calculating the power-transmitting capacity of gears, but the generally-accepted way is by the Lewis formula, or some one of its amplifications. The calculations for a bevel gear are based on a pitch and pitch diameter at the middle of the face, thus averaging the strength between the large and small end. Worm gear strength may be calculated like a narrow-face spur gear, but the strength of worm gears is usually of minor importance; as wear and bearing surface are the features that determine the size of a worm gear rather than tooth strength. The same applies to helical gears with shafts not parallel. Helical gears with parallel shafts, or double helicals, are treated as spurs, except that their constants are different on account of smoother action and more teeth in mesh, which minimizes the shock factor and permits a higher speed.

Spur Gear Tooth

The spur gear tooth is essentially a cantilever of definite form and strength, but subject to applied bending movements which vary in amount, point of application and degree of suddenness of application. The pinion tooth is the weaker in form, being narrower at the root, so if the gear and pinion are of like material, only the pinion need be calculated. If the pinion is steel and the gear cast iron or semi-steel, or if the pinion is heat-treated steel and the gear annealed steel casting, both members should be calculated.

Lewis Formula

The Lewis formula gives the tangential load or tooth pressure in pounds, which can be transmitted by a gear of given pitch, face, number of teeth and material.

$$W = S P' f y \frac{600}{600 \text{ plus } V}$$

W = Load transmitted in pounds.
P' = Circular pitch.
f = Face.
y = Factor for number and form of teeth.
S = Safe working stress of material.
V = Velocity in feet per minute.

The strength of the tooth is taken as directly proportional to the circular pitch or centre to centre distance of the teeth at the pitch line. If the diametrical pitch is given, it may be converted to circular pitch by dividing 3.1416 by the diametrical pitch.

Bevel Gear Proportions

It is assumed that the power a gear can transmit is proportional to its face, but this is only true within reasonable limits, depending on the workmanship, rigidity of the bearings, size of shafts, whether gear is overhung and like factors. If the face is not over twice the pitch for overhung gears, or three times the pitch for gears centrally mounted, the formula applies. Beyond this the chance of too much load being concentrated on one end of a tooth must be taken into account. The face of a bevel gear should not be over one-third, and preferably not over one-quarter of the cone distance. Any length over one-third adds nothing to the strength.

The factor "y" is taken from the following table:

Value of Factor "Y"

Number of Teeth.	Involute 20 Degrees.	Involute 15 Degrees Cycloidal.	Radial Flanks.
12	0.078	0.067	0.052
13	0.083	0.070	0.053
14	0.088	0.072	0.054
15	0.092	0.075	0.055
16	0.094	0.077	0.056
17	0.096	0.080	0.057
18	0.098	0.083	0.058
19	0.100	0.087	0.059
20	0.102	0.090	0.060
21	0.104	0.092	0.061
23	0.106	0.094	0.062
25	0.108	0.097	0.063
27	0.111	0.100	0.064
30	0.114	0.102	0.065
34	0.118	0.104	0.066
38	0.122	0.107	0.067
43	0.126	0.110	0.068
50	0.130	0.112	0.069
60	0.134	0.114	0.070
75	0.138	0.116	0.071
100	0.142	0.118	0.072
150	0.146	0.120	0.073
300	0.150	0.122	0.074
Rack	0.154	0.124	0.075

The last portion of the formula recognizes the fact that a gear will not carry as great a tooth pressure at high speed as at low. The form of the fraction is such that velocity is a relatively negligible factor at very low speeds, but becomes of increasing importance as the speed rises, and soon imposes a practical limit on increases of speed. This agrees with observed good practice.

It is thus comparatively simple to find the strength of any gear, but there is no satisfactory method of reversing the process so that a gear might be designed by formula for given conditions. It is customary, therefore, to proceed by the trial and error method. The table, chart and instructions for use which are given with the illustrations hereto give a good straightforward procedure. The table is by Henry Hess.

Shrouding the Teeth

The shrouding of the teeth of cast gears or pinions was an expedient to increase their load carrying capacity that was formerly much in vogue. In these modern days of accurate cut teeth and high-grade materials, it is safe to say that shrouding is obsolete. Even with slow-moving steel pinions there is more lost due to inability to obtain a good tooth form and even contact than is gained by the added support. The end milling process is the only practical one for cutting shrouded gears. In general this form is confined to rough castings.

Division By Grades

The quality of workmanship and degree of accuracy of fits of gears have been subdivided into three grades by the American Gear Manufacturers' Association Standardization Committee. This was brought about in the course of establishing standard inspection limits on the diameter of bore for different classes and sizes of work.

The first grade is "Precision, for Aircraft, Printing Machines, etc." In this class the accuracy requirements, not merely on the bore, but in all ways, are held very high, in fact as high as it is possible and yet get out the work on a production basis. Such quality was, a few years ago, confined to the tool room.

The second grade is that used on "gears for automobile and machine tools." While the limits are close, they lend themselves to mass production with fixed tools. Silence of tooth action is a big feature when judging the quality of automobile gears. The same applies to machine tools, though here, freedom from vibration is more important than the actual silence which results therefrom. In both this and the preceding class, all gears are supposed to be absolutely interchangeable.

The third grade is specified under the term "Standard Jobbing Gears." It includes most large heavy work, and gears

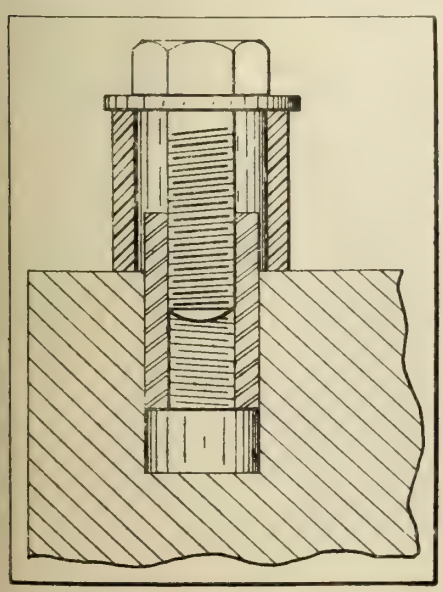
Practical Ideas From Practical Men

REMOVING BUSHINGS

By A. Le Marshall

A method which the writer has used for a number of years in removing bushings from blind holes, and one that has given good satisfaction, is to run a tap of the nearest size into the hole of the bush so that a shallow thread will result. By placing a sleeve, a little larger than the bush, over the opening and using a washer and cap screw as shown in the sketch, the bush can be drawn out quite easily. This method will be found useful in automobile work, where the through hole is a trifle larger than the inside diameter of the bush. The writer has used this method in removing hardened bushings from air hammers. First plug the hole with fire clay to keep flame out of cylinder then heat and anneal bush, after which tap and draw out as stated.

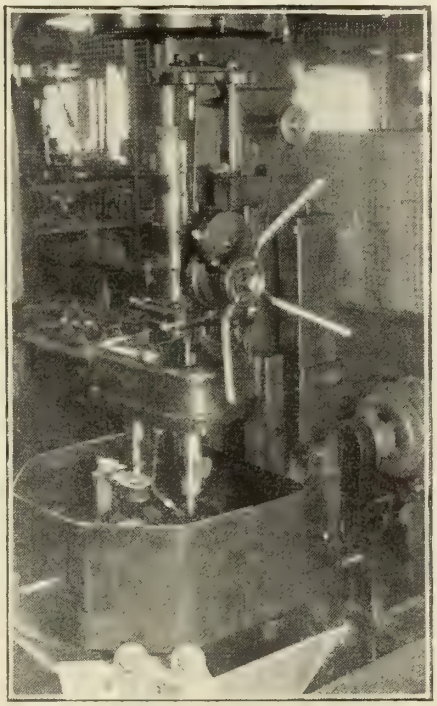


Removing tight bushings.

DRILL ADAPTED TO SPECIAL OPERATION

An interesting drilling and reaming operation on a regular Rockford 20 in. box column drilling machine is shown in the accompanying illustration and described herewith. The drill is regularly rated as having a capacity to drive a 2 in. high speed drill in solid steel. The drive is direct by silent chain from electric motor through interchangeable pick-off gears for speed changes. Four speed changes are regularly provided in a simple feed box.

A four station rotary table, with index plunger worked by foot treadle, is applied to the regular table. The rotary table is indexed by hand after the locating plunger is pulled. The table is provided with four two-jaw chucks, with formed jaws to suit the work. An extended wrench is provided so that the work of tightening the chuck screws takes place outside of the chip guard. These chucks are under work spindles with operation going on while the fourth is being loaded. A finished piece is removed at each index. A three spindle drive head equipped with a "V" gibbed slide, is mounted on the table ways. The spindle drives and feeds this head. The head is fully counter-weighed. A positive micrometer adjustment stop on the quill is provided for a depth gauge. An adjustment for height and diameter of drill; drill bushings support is provided under the left hand spindle.



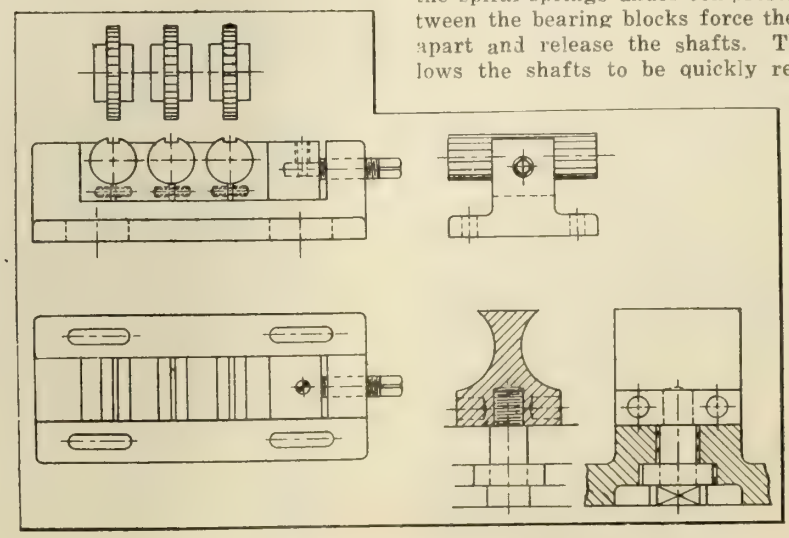
Interesting drilling and reaming operation.

The sequence of operations is given as follows: first spindle, rough drill; second spindle, rough taper ream and face; third spindle, finish taper ream. The work consists of yoke and flange members of a new oil lubricator universal joint, and production is maintained at the rate of 250 pieces a day. Diameter of rough drilled hole, ¾ in., length 2⅝ in.

MILLING KEYWAYS IN SHAFTS

By Hubert Bentley

In order to reduce the time required for milling flats and cutting keyways in a quantity of similar shafts, the vise shown in the accompanying elevations and plan was constructed and has proved extremely useful. This allows the shafts to be milled in threes, but the same principle may, of course, be employed to deal with four or more shafts up to the machine's capacity and simply by the addition of bearing blocks. Originally the shafts to be keywayed were 1¾ in. dia. by 6 in. long, and these were supported by a single vise as shown. For longer shafts two vises would be necessary, while three would be required in the case of very long shafts. The vise is fastened down to the milling machine table by the usual bolts. The bearing blocks for supporting the shafts are loose and each one is held down to the vise by a stud and plate (see enlarged detail.) The blocks, which are adjusted so that there is no lift, are free to move along the vise until the grip screw on the right is tightened up. When the grip screw is slackened the spiral springs under compression between the bearing blocks force the same apart and release the shafts. This allows the shafts to be quickly removed



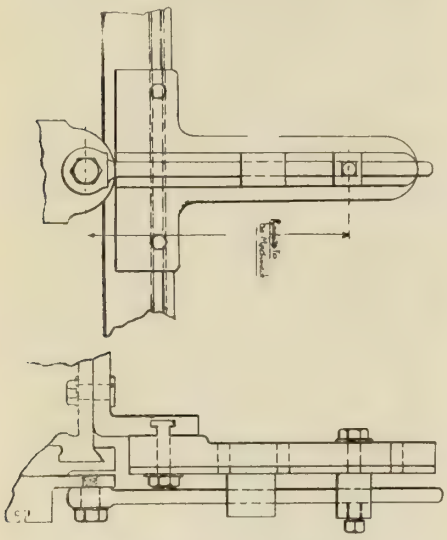
Milling keyways in shafts.

and another set placed in position. The inner end of the grip screw is kept in position in the loose jaw by a screw and groove. The other end is squared to receive a standard spanner. The bearing blocks are bored out to the shaft diameters. Other sizes may be dealt with if additional blocks are provided or split flanged bushes may be used in the existing bearing blocks for shafts of smaller diameter. Although designed for the milling machine, these vises are equally useful for similar jobs on the shaping or planing machine where the work is of a repetition character.

RADIUS FIXTURE FOR LATHE

By T. H. Hargrove

The accompanying sketch illustrates a fixture designed for turning radii in the lathe on such work as the crowning of pulleys, etc. Briefly the various parts consist of the cast-iron angle bracket A secured to the back of the lathe bed by the two bolts shown. On the upper face of this angle a tie slot



Radius fixture for lathe.

is machined, into which the bracket B is fitted. Along the center line of B are drilled four ⅞-in. holes to suit the different radii, adjustment being made by the bolt C along the connecting rod D. This, as shown in the assembled view, is clamped to the bottom slide of the saddle by a pin E through a hole drilled and tapped at the back of the bottom slide. In use the bottom slide screw is released from its nut, the feed-in of the tool being made by means of the top slide. The setting block F is to ensure the cutting point of the tool being central (when so desired) with the work when at the highest point of the radius. It will be observed that the setting block F is the same width as the step on the bracket B. In the crowning of pulleys, for instance, the method of procedure is as follows: the bracket B is moved along the angle plate to a convenient position and then clamped securely. The rod D is then swung by moving the saddle along the bed till it lies along the center line of B, this being known by the sides of the block F being flush with the step on the bracket when placed over the rod. The tool is then set central between the sides of the rim and after adjusting the cross slide to the correct radius the bolt C is tightened down and rod D clamped by means of set-screw shown. The measurement of the radius required to be turned is taken from the center of the bolt C to the center of the pin E.

A POINTER FOR THE DESIGNERS OF SCREW MACHINE PRODUCTS

By D. A. Hampson

"Make wider necks at the ends of threads." Rigid adherence to this rule would save more than one-fourth the cost of screw machine products. And this applies equally well in the small shop that has one hand screw machine and where the boss or the foreman is the designer and in the large plant whose production is in charge of a chief engineer.

Most men, when confronted with the proportions of a threaded piece, conclude that a neck in which to end the thread is the last word in design. They know that it is feasible to design threaded pieces where the die stops anywhere on the bar, hence, if a neck is added it is a refinement that should take all the curse out of die troubles. And so they look at the mouth of dies, see that one and a half or two threads are so flared, and they dimension a neck that is two threads wide.

A two-thread neck may be sufficient on straight bar work but it is not enough on shoulder work. Screw machine men know that the die doesn't always travel the same distance within a sixty-fourth, they know that the different spindles of a multi-spindle automatic will not bring the neck in the same relation to the die by the time the thread is finished, and they know from bitter experience that you cannot set the end of the die closer than 1/32in. from the shoulder, sometimes further away. Also they know that dies that apparently have a short neck, may have a leading section three threads long or more.

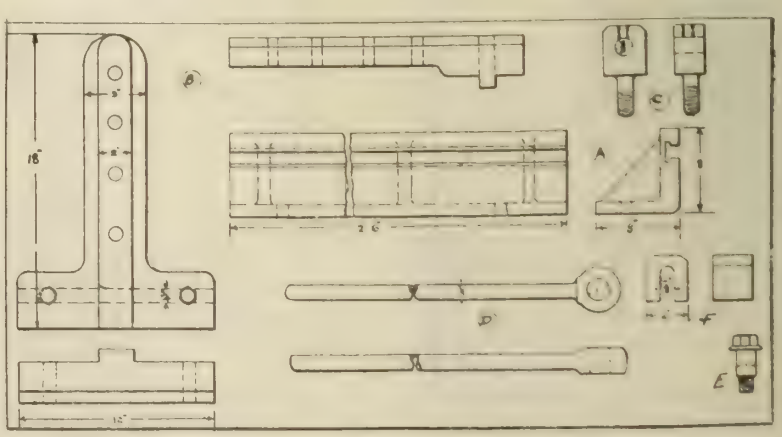
All these truths fairly scream for a wider neck. On such a simple piece as a set screw, there is no reason why the neck shouldn't be wider even if it did not assist the automatic operator. Not once in a hundred times is the last eighth of an inch of thread necessary or used on a set screw.

There is another class of work where wider necks will help materially. That is on work pieces that have a running nut that travels full length. When the assembly department comes to use these parts, they find that the nuts encounter a fat thread just "east of the neck;" the screw machine man had kept the die a little away from the shoulder to avoid jamming, the die either came with a long throat or such a one was put on it in re-grinding, and the fat thread resulted. It would have made no difference if two more threads had been cut out to form a wider neck, for the nut was amply long with bearing enough at all times on the screw.

Threads which go in a long nut or into deep tapped holes come in about the same class. In running on and off, a die naturally makes the end of a screw a shade smaller than the part where it stops its travel under a cut, even though the mouth of the die had passed onto the neck. This leaves a tapered thread to which a close fit cannot be made.

In one case, thousands of ⅜in. x 24 screws 1½in. long were used every week. The nut had to be fitted close and smooth throughout the length of its possible travel. It was found that commercial accuracy was not good enough and so the shop put in their own automatics. Even then they could not get the desired straight screw, free from a fat thread until they had doubled the width of the neck—and so doing avoided the (hand) dieing operation formerly required and produced a more symmetrical screw.

The discovery of rustless iron has made it necessary to be able to treat ferro-chromium by some process which will remove the carbon. Among the methods proposed is that of heating ferro-chromium in contact with hydrogen.

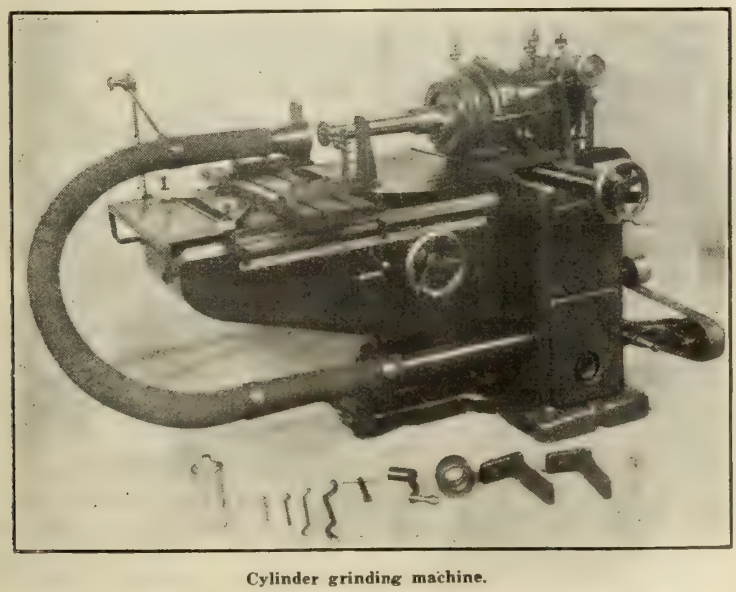


Details of radius fixture for lathe.

New Things in Shop Equipment

CYLINDER GRINDING MACHINE

A new type of cylinder grinding machine that has some interesting features incorporated has recently been placed on the market. The wheel spindle is of the two-piece type, made of special alloy steel, heat treated and ground all over, and carried in a double eccentric sleeve. Wheel spindle position is adjustable by means of suitable extensions, thus eliminating any unnecessary overhang of the wheel. Adjustable bronze bearings are provided for the spindle, which is also fitted with a self-aligning ball bearing to take the end thrust. The eccentric sleeve is driven by worm and worm wheel which assures smooth rotary action. Adjustment of the eccentric sleeve is obtained through a worm and ratchet gear device, which may be operated when machine is running. Final setting is accurately and readily obtained by means of graduated dial. The machine is driven by endless belt through a powerful friction clutch. Individual grinding wheels are assembled on independent collets, thus avoiding truing every time a change is made. Even tension on the drive belts is maintained by special arrangement of pulleys, eliminating need of springs or weights. The headstock carriage is mounted on the bed to traverse at right angles to wheel spindle. The work table is mounted on large heavy knee which is adjustable vertically. Feeding is obtained by parallel motion of the work table. Reversal of feed is obtained automatically by means of adjustable trip blocks. All dust and cuttings are drawn from the wheel and work through a large rubber hose directly connected to an exhaust fan located in the frame of the machine. The vertical distance from the wheel centre to the work table may be varied from 2¼ to 9 in. Table has a travel of 22 in., while the wheel carriage may be traversed 27 in. Wheel spindle may be operated at either 5,000 or 7,000 r.p.m., and feeds of from 4.8 to 9.2 in. per min. are obtainable. Machine requires a floor space of 71 x 58 in. These grinders are now manufactured by the Gisholt Machine Co., Madison, Wis.



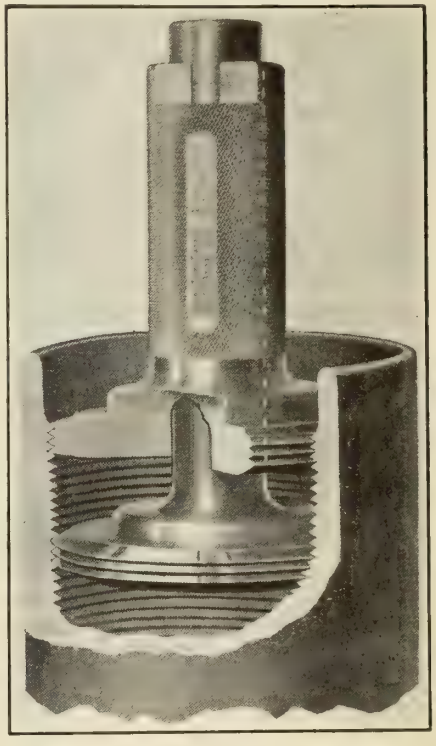
Cylinder grinding machine.

VALVE GRINDING MACHINE

A portable machine for grinding automotive poppet valves to a definite angularity and for grinding reseating cutters used for facing valve seats to the same angularity as the valve has been developed and offered to the trade recently. The machine is not of the adjustable type as it is assembled at the factory to grind at a pre-determined angle, and is therefore a single-purpose tool. The machine is driven by a Westinghouse motor which is mounted on a low, flat base. It is so located on the stand that vibration is reduced to a minimum, so that accuracy of grinding is not affected. Movement of the valve holding spindle is obtained by means of a hand lever. Feed is by a small hand wheel and screw. These tools are made by the Franklin Machine and Tool Co., Springfield, Mass.

DOUBLE-PLUG PIPE GAUGE

A new type of internal gauge for measuring the taper of female pipe threads has just been placed on the market. The general construction and application is clearly shown in the accompanying illustration. The gauge is marked 1 division = .002 in., which signifies that one division on the handle of the gauge represents a variation of .002 in. in pitch diameter in a length of 2 in., this length being the distance covered by the tool. In use the inner plug is first screwed down into the thread by hand,



Double-plug pipe gauge.

followed by the outer gauge, both parts being set hand tight. If the taper is correct the witness line on the inner gauge will come opposite the zero line on the graduations on the outer gauge. Any variation from the true taper is read directly on the scale. As these gauges are made up to order, it is possible to obtain slight variations from the specifications. These gauges are made by the Pratt and Whitney Co., New York.

SENSITIVE DRILLING MACHINE

For taking care of light drilling where extreme accuracy is required, a sensitive drilling machine has recently been placed on the market. It is particularly adapted to precision tool and manufacturing work. The machine and the motor are separated but mounted on the same base, but the design permits of driving the machine from overhead if desired. The base, when located on the bench, rests on three rubber contacts, so that the machine remains steadily in

position without the use of bolts or clamps. The spindle is 9/16 in. dia. and is hardened and accurately ground. It has a vertical movement of 2 in. regulated by adjustable stops. The tension on the drive belt can be adjusted by means of a thumbscrew which regulates the position of the idler pulley bracket. The 1½ in. dia. steel column is 13 in. high. The table may be adjusted both radially and vertically. There is a space of 8 in. between the base and the chuck and 4 in. between the spindle and the surface of column. Chuck has a capacity of drills up to ¼ in. The ratchet lever allows operator to use pressure in the most desirable position. Jigs or fixtures may be used in place of the regular table. The spindle operates at a speed of from 1.500 to 2,500 r.p.m., but machine may be adapted to speeds as high as 8,000 r.p.m. The spindle pulley is adequately protected by means of a suitable guard that is easily detachable. Excess lubrication is thrown off into recesses from which it flows by gravity to an oil chamber. These machines are marketed by Adolph Muehlmatt, Cincinnati, Ohio.

PORTABLE PIPE-VISE STAND

A portable stand for service when considerable pipe fitting is required about the plant has been placed on the market recently. The frame of the appliance is made of malleable iron and fitted with a shelf for holding tools. The pipe bending attachment is a part of the body casting, and is easily mounted or detached. Legs are fitted with holding points and feet to avoid slipping. The stand can be equipped to hold any type of hinged or chain pipe vise having capacities up to 2½ in. Weight is approximately 50 lbs. These stands are made by the American Pipe Tool Co., Chicago, Ill.

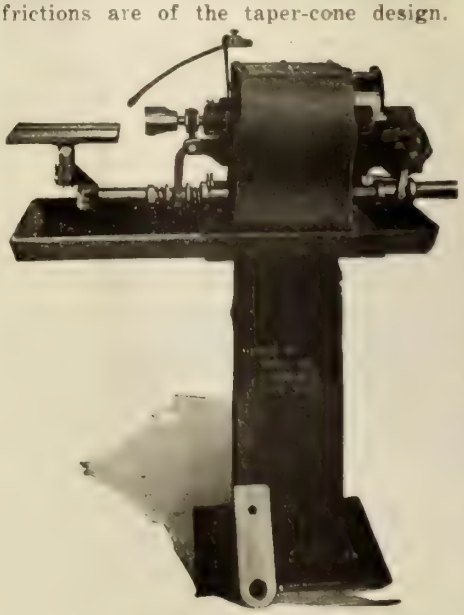
POWER SCREW PRESS

A power-operated screw press capable of exerting a pressure up to 50 tons has been placed on the market recently. When working at a pressure of from 25 to 30 tons the speed of the ram is 7 ft. per minute. A marine type of clutch is used for driving the power screw. The control of the machine is obtained by means of a lever at the side of the machine, this lever being adjustable to suit the convenience of the operator. All working parts of the driving mechanism are mounted on the back of the head and are readily accessible. The vertical pressure screw is 3 in. in dia. and 48 in. long, and is usually furnished with a 2-in. lead double Acme thread. When fitted with a single thread the clutch may be released and the pressure held at any point without consuming power. Special S.K.F. bearings are fitted to take the end thrust of the screw. Worm is fitted with radial and thrust ball bearings. The base is designed so that jigs and fixtures may be accurately fitted. Machine has a capacity between uprights of 37½ in. and a vertical maximum space of 32 in. Ram has a movement of 24 in. When using a motor drive the motor is mounted on a special base at the rear. Floor space required, 27 by 49 in., with a total height of 76 in. These presses are made by the Atlas Press Co., Kalamazoo, Mich.

AUTOMATIC TAPPING MACHINE

A new design of automatic tapping machine has been placed on the market recently. The machine is equipped with a power feed and an automatic reverse. It is not necessary to depend on the pressure on the tap to make the machine drive and reverse itself, which is the case with hand-operated machines. The tap runs perfectly free and for this reason an accurate thread is cut, as the tendency of the tap to cut oversize or the metal to stretch is done away with. The operator has only to place the work on the machine, pushing same against the tap until it has started to enter, at which time the power feed takes hold driving the tap until thread is completed then automatically reverses the spindle and backs out tap at twice the forward speed. This relieves the operator from continually pushing the work against the tap while tap is entering and pulling on the work when tap is reversing, and leaves his hands free to select another piece of work.

The new machine drives through a friction governed by the automatic feed, which is, in turn, controlled by another friction. By this arrangement the machine may be set to be very sensitive and, it is claimed, will slip before breaking the smaller sizes, or it may be adjusted to pull the larger coarse thread taps. Not only are the machines driven through a friction on the forward motion, but they are also driven through frictions on the reverse motion for the reason that taps sometimes become bound and are frequently broken when backing out of the hole. The driving frictions are of the taper-cone design. The face of the friction ring is tapered both sides to fit into the driving and reversing cones and is keyed to the spindle. This design eliminates all shock to the tap and practically overcomes tap breakage.



Automatic Tapping Machine.

The working parts are running in oil. The thrust of the spindle is taken on ball bearings in both the forward and reverse motion. The spindle is regularly equipped with a Skinner positive drive tap chuck and the machine is also equipped with pump and tank supplying lubricant on the tap at all times. The table is full universal and fitted with the slot for attaching jigs, etc. It is therefore possible to tap holes from any angle. A face plate is also furnished with the machine. This plate fits on the draw bar in place of the table. The face of the plate opposite the front of the machine is accurately planed, to which jigs or holding fixtures may be attached, the tap entering the work after passing through the plate which is drilled. This is for use when the part to be tapped is larger than can be easily handled on the universal table.

The machines are single-belt driven and may be belted direct to the line shaft or, if several sizes of taps are to be used, a countershaft giving three speeds can be furnished. The new machine has a capacity from ⅛ to ⅝ of an inch in steel. The machine can be run at very high speeds and the production which can be obtained depends entirely on the stamina of the tap. (The use of relieved taps is recommended). Production does not depend on experienced labor, as a green hand, man, girl or boy, can get the maximum production even though the tap be driven to the bottom of blind holes. These machines are manufactured by the Burke Machine Tool Co., Conneaut, Ohio.

CONDENSITE CELORON

(Continued from page 16)

mentioned property is somewhat dependent upon the other three.

Probably the greatest use for this material in the radio industry is in the manufacture of panels. Possessing a beautiful finish, coupled with the fact that it can be readily machined in the way of being sawed, drilled, tapped or engraved, in addition to its excellent electrical properties, make it an ideal panel material. Its use runs from the simple crystal set to panels two to three feet square and up to one-half inch thick for the ultra-sensitive receiving set with its many stages of amplification. In the construction of the receiving set it finds additional uses in the form of tubes on which to wind the wire, end plates for the condensers, vacuum tube bases, rheostat bases, terminal blocks, etc. In transmitting equipment its insulating properties make it very serviceable for mountings of inductance coils, for high voltage condensers, spark discharges, transformer housings, switchboard panels, antenna switches, relay keys and many other relative applications.

Unemployment Greatly Reduced

IT IS REPORTED from offices of the Government employment service that conditions in the labor market in Toronto are fairly representative of those existing in other parts of the country. At the beginning of the present year, the registered unemployed numbered about 14,000. During the summer months this was reduced to 2,000, and included handicapped men or those who had some disability. At the present time the number reported at the city headquarters is 5,000. This may be increased in January and February, but it is pointed out the tendency reflects seasonal conditions and not a lack of industrial activity.

At this time last year, there was no demand for men from the lumbering industry, whereas this year the call is such as to indicate unusually extensive operations in the bush. Several thousand men have thus been absorbed. There is a great amount of work in hand that will be interfered with by the weather, and there may not develop an activity in manufacturing to absorb quickly the number of men thus made available. There will be unemployment, but not to the same extent as last year.

A phase of unemployment which agencies find it difficult to deal with is that of recently-arrived immigrants who expect a somewhat extreme show of paternalism from municipal or government institutions. They indicate strong preference for the cities, are not the most active in looking for work, and are always the hardest to please. The man who, for the time being, is anxious to do anything as a step towards getting along, is not a prominent feature in the unemployment roster.

Prefers the Trade Newspaper

HENRY FORD prefers trade newspapers to Emerson. In a series of articles on "The Real Henry Ford," now running through the daily press, this is one of the interesting sidelights entering into the portrayal. The motor magnate is described as a man of ideals, emotions and impulses, one in whom there is something that is never still. The industrial organization that he has built up is referred to as representing a far more equable assembly, a more carefully ordered mechanism than that which represents his personality. The latter has been said to be fascinating in its uncertainty; his work as inspiring in its accomplishment. Through it all the trade newspaper has probably been one of his most intimate associates.

Of Henry Ford, it may be a keynote observation that he likes not Emerson the less, because of his large words, but because he likes contact with the world of industrial action more. Trade newspapers are interpreting that world for him. It was in this arena that he fought, experimented, developed, produced. Hence his preference for the trade newspaper. Described as a man of many moods, he expresses a liking for reading that eliminates superficial non-essentials and speaks in terms that he understands by reason of his lifelong association. The trade newspaper records events and developments in the university of industrial progress of which Henry Ford and other successful business men are, in a sense, the alumni.

Trade newspapers, further, may be described as mediums through which men help themselves. Mr. Ford has made available the means whereby great good has been done. His benefactions are extensive and well organized. Yet they largely embody the fundamental idea that a man must help himself. He does not decry education, but his conviction is that of the trade newspaper, that education is valueless unless it can have practical application or expression. He undoubtedly subscribes to Emerson's teaching that "intellectual tasting of life will not supersede muscular activity. If a man should consider the nicety of the passage of a piece of bread down his throat, he would starve. At Education-Farm the noblest theory of life sat on the noblest figures of young men and maidens, quite powerless and melancholy. It would not rake or pitch a fork of hay; it would not rub down a horse; and the men and maidens it left pale and hungry."

There may be those who ascribe to Mr. Ford a desire to interpret, in terms of iron, steel and rubber, the saying of Emerson's that "Everything good is on the highway." There is little comfort in ill-formed impressions. As the apostle of restlessness and action and self-help, Henry Ford is one with the essayist in that "Life is not intellectual or critical, but sturdy. To live the greatest number of good hours, is wisdom. Since our office is with moments, let us husband them. Let us be poised and wise and our own to-day."

Keep the Cars Moving

BUSINESS executives are being advised that a great deal depends upon their co-operation with the railroads, in relieving car shortages. It is important that more goods be loaded in each car and that cars are released promptly. It is pointed out that U. S. traffic is from 5 per cent. to 17 per cent. heavier this Fall, and that Canadian traffic is also increasing. It is essential that available car supply be protected. Shortage is a menace to industrial progress and to every factor entering into satisfactory production. It is up to the manufacturer to consider ways and means of avoiding a costly problem of this kind.

Pig Iron Demand Improves as Price Declines

Cut of Two Dollars a Ton Brings Out the Buyers—Some Large Tonnages Placed for First Quarter—Inventory Season Explains Inactivity in Finished Products—Year Closes With Good Record

COAL STRIKE MENACE BEHIND BUYING MOVES?

THAT the pig iron market is steadily becoming less one-sided and that buyers are booking in fair quantities for future requirements, is the report of furnace representatives. The activity is undoubtedly due in large measure, to the recent reductions that have taken place, amounting in three weeks to $3.00 per ton.

The most recent drop has brought the price to a low of $30.80. This, it is declared, is a rock bottom figure and that conditions are more favorable to an advance early in the New Year. Large buyers have appeared in the market and good tonnages are reported to have been booked.

There is likely to be a very material increase in production shortly. Steel Company of Canada are preparing to blow in their new furnace, the Algoma Steel Co., are doing some extensive rebricking and it is reported may have the full battery running by March. Their requirements in basic pig will have to be considered and there is prospect of increasingly steady merchant demand. Stocks undoubtedly are running low with the foundries.

Pittsburgh also reports an awakening of the pig iron demand. Prices ranging from $25 to $26, valley, represent attractive concessions, and buyers are said to recognize that there can be little room for further reductions. First quarter business therefore, is likely to develop. Among large recent orders is that of General Motors, Detroit, who are said to have ordered 18,000 tons of iron for delivery early in 1923 at $27 Detroit.

Again the menace of a coal strike appears in the prospect. Steel interests who are low in pig iron seem disposed to stock in order to be covered for whatever may transpire April 1. It does not appear that public opinion is entitled to a great amount of confidence as regards the disfavor with which it may stamp a strike movement. Miners' leaders do not show a great deal of respect for that sort of thing. At least it did not appear so in connection with the last strike. There is said to be, however, another reason for the present buying movement, aside from fear of strike. In the case of bars, shapes and plates, shipments are at less than current market prices, and it is not advisable that old contracts should be canceled.

Canadian markets are showing a Christmas season inactivity. Inventories are being taken, and while a fair demand for sheets, bars, hoops, etc., is shown, dealers are not looking for anything of a speculative character this year. Prices show no change, and in this they only reflect the year-end characteristic of basic markets.

Machine tool men report that the year to date shows a 50-per cent. improvement over last year, that activity in many important industries is having a beneficial effect and that the demand for supplies of all kinds continues to be a feature of the market.

Toronto

December 13.

REDUCTION in pig iron prices is the feature event of this market. At $30.80 a ton, conditions seem somewhat attractive. Large foundries are placing for advance requirements, and there is considerable wisdom in this for price does not seem the only factor worth considering. Not only is there a likelihood of a stiffer price early in 1923, but it must be remembered that April 1 is the date on which there must be another showdown with the coal miners. It is claimed that there is likelihood of another strike; that there does not appear to be, at least, any influence at work that may be effective in preventing it.

Approach of the Christmas season explains a certain inactivity. With inventories on the schedule, no great amount of buying is looked for. Stability of prices contributes to this condition.

Iron and Steel.—There is no doubt that moderate weather has enabled the market to approach the year end with very encouraging sales records. Bookings show marked improvement over last year, and it is felt that industry generally has by no means found its stride. Sheets show a seasonal falling off, but even here the weather has been favorably disposed and it has been possible to carry a great amount of work to completion. Prices:

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 75
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		4 25
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 00

Old Material.—"It is almost impossible to point to any feature in the market," said a large dealer. "There is not what might be called a good demand, nor is there much material offering. Prices remain steady. We would not be surprised to see advances in copper early in the New Year."

There is reported to be a scarcity in some specialty grades of material. Reports from U. S. centres indicate easier prices on heavy milling steel. Approach of the inventory season accounts, in a measure, for light buying. Dealers' average buying prices:

Copper, light	9 00
Copper, crucible	11 25
Copper, heavy	11 00
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton.	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Non-Ferrous Metals.—This market shows no outstanding movement so far as Canadian demand is concerned. New York reports copper to be firming. In the likelihood that prices will advance, New York reports that buyers have of late been quite active and that good-sized orders had been booked. Practically all producers are holding at $14.

Again the London tin market is in eruption. A sharp rise of $1 was recently recorded, and this has affected the foreign demand—this and new high records in sterling exchange. Further increases in tin are said to be likely. Zinc prices, according to American advices, are strong and likely to advance. Lead prices continue steady. Current quotations:

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

Montreal

December 13.

USUAL seasonal quietness in the steel trade and its allied connections is now making itself evident and will continue so until after the turn of the year. Manufacturers and warehouse firms are preparing to take stock of the year's turnover which, on the whole, will show a great improvement over the previous

year and assuredly will enable them to see more comfortable results of the turnover during the year now ending. This is the month for inventories and from now until the end of it only the most necessary and urgent supplies will be purchased. Stocks in warehouses and in the possession of consumers are at a minimum and even where quantities exist there will be no necessity for writing off anything because of market declines. Values are steady and a feeling of confidence exists that they will hold firm. Very good prospects of bigger business are indicated for the new year in all branches of building and manufacture.

Iron and Steel.—Boiler tubes are in fair demand only, as the rush to obtain supplies for repairs and renewal of steam equipment for the cold weather months is over. Supplies continue difficult to procure promptly and it is necessary to allow the mills about three months for shipment of orders.

Galvanized and black sheets are very dull just now and no movement at all is taking place in these lines, but it is only of seasonal duration. Prices:

Iron bars, base	3 15 to 3 25
Steel bars, base	3 15 to 3 25
Reinforcing bars, base	3 15 to 3 25
Steel hoops	4 00
Tire steel	3 25 to 3 40
Spring steel	7 00
Band steel, No. 10 gauge and 3-16" base	3 65 3 75
Small shapes	3 40
Sheets, black, No. 28	4 75
Sheets, blue, ann., No. 10	4 25
Canada plates, dull, 52 sheets	5 00
Canada Plates, all bright	7 00
Galvanized Sheets, No. 28	6 50

Pig Iron.—A further reduction of $2 a ton in Canadian pig iron is announced. This may be said to represent a stable level. Foundries are realizing this and buying represents larger volume and confidence that bottom has been reached. Prediction is made in some quarters that prices are likely to show an upward trend with the new year. Current quotations.

Algoma, No. 1, car lots on Tracks, nominal quotation		33 15
Summerlee, 30-ton lots, dock	35 00	
Carron, 30 ton lots	35 00	
Do., 5 ton lots, ex. warehouse	40 50	

Non-Ferrous Metals.—Market is quiet with very light demand as is customary at this time of the year. Referring to basic markets, the British Metal Corporation (Canada) Ltd. has this to say:

Copper.—The 14c price is now an established one in the U. S. domestic market, and export offerings are on the same parity. Consumers have enough orders in to keep them going for another month or two and whatever new orders may be booked it is likely that the covering of the necessary raw material will be delayed if possible until early in next year.

In face of the continued appreciation of sterling, the London market has held firm.

Tin.—There has been a net gain of £5-15-0 on the London market, prices closing at £180-15-0 for spot and £181-15-0 for forward. Considerably more interest has been taken, the turnover of standard being 4,600 tons and sales in the East totalling 1,250 tons.

This advance and the rise in sterling has brought New York price from 36.12 cents to 37½ cents.

Lead.—U. S. Eastern prices remain nominally unchanged, though the undertone is weaker due to arrivals from the West owing to the better transport facilities. Supplies, stimulated by high values, are increasing.

Spelter. — Spelter has advanced throughout the week and is now back at its previous high level. Demand from the Continent, where supplies are scarce, added strength to the upward movement.

Prices on Montreal market are as follows:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	45 00
Lead	8 00
Spelter	9 50
Antimony	7 50
Aluminum	22 00

Pittsburgh

December 13.

THE WEEK'S developments in the iron and steel market are particularly interesting, although it certainly cannot be said that they stand together in making the market situation either better or worse than was estimated before the information came out.

As to production, the steel ingot production rate in November is found to have been almost exactly the same as the rate in October, about 40,000,000 tons a year, while the rate of pig iron production in November was about 34,900,000 tons a year against a rate of 31,350,000 tons in October, showing an increase of 11 per cent. Merchant furnace production of pig iron increased 20 per cent. and steel works' production of pig iron 9 per cent.

As the steel works cannot possibly have had any stocks of pig iron October 1 on which to draw, the October production of steel was no greater than the production of pig iron would support, and with more pig iron made in November and no more steel, the plain inference is that some pig iron was stocked. As to the merchant furnaces, it is known that recently some of them had to begin stocking iron. As the steel production rate did not change, this has no bearing on the question of steel demand, present or prospective, but it does suggest that possibly some steel interests are disposed to stock some pig iron against April 1 when there may be another coal strike. Some observers express the opinion, as the result of their observations, that the majority of men who are following this subject think it more likely than not that there will be another coal strike April 1. Those who think there will not be rest their opinion largely upon the argument that the operators and miners' leaders would not have the courage, in the face of public opinion, to indulge in another strike. Surely, however, their record in the past hardly justifies such confidence.

Continuance of steel ingot production at a 40,000,000-ton rate, which has now been maintained since the beginning of October, is in itself an interesting event, since the rate is 15 per cent. above the average rate in the six months preceding when seasonal conditions were more favorable to steel consumption. One can hardly avoid believing that not all the steel being made and shipped is being currently consumed. If buyers are piling steel there must be a particular reason. Normally they are particularly adverse to doing so late in the year on account of inventory. Probably the strike fear has an influence in a double way. First, the buyers probably feel it a measure of safety to accumulate some steel, for if there is another strike next April the steel mills cannot possibly be as well fortified in the matter of stocks of coal to meet it as they were in the case of the strike last April. Second, much of the steel now being shipped, at any rate in the case of bars, shapes and plates, is at considerably less than current market prices, the purchases having been made some time ago. Requests for postponement would be met by mills with suggestions of cancellation, and while, in general, buyers would probably expect bars, shapes and plates to decline with another coal strike as a possibility, the market may not decline for months, hence cancellation of orders at below present prices would be unwise for the buyer.

Boom in Construction

Developments in finished steel products individually in the week have been of no consequence. There has continued to be heavy pressure upon pipe mills for deliveries, with a fair amount of new buying. On butt weld merchant pipe the earliest delivery promise on new orders seems to be eight weeks. This condition reflects the great boom in garage and dwelling house construction, in which there is no visible prospect of a let-up in the discernible future. The same influence makes nails continue strong. As to demand and supply, the nail price could easily be advanced, but the general conservative policy of the Steel Corporation prevents this. In sheets the market is a shade quieter still. The leading interest, which when opening order books November 23 for the first quarter was really in line to carry over about two months of deliveries, has been booking for March and now has the month pretty well filled up. Sales by independents have been chiefly for prompt shipment. In tin plate the buying is for prompt delivery and delivery in the early part of the new year. While the market was opened November 23 for the half year, few, if any, consumers have availed themselves of the opportunity to cover so far ahead as to July 1. The market is steady, with tin plate at $4.75, blue annealed sheets at 2.50c, black at 3.35c and galvanized at 4.35c. In automobile sheets the leading interest's price is 4.70c and it is understood

to be sold up through first quarter, its present transactions being for second quarter. The independents maintain their old price of 5.00c and are securing first quarter business.

The Carnegie Steel Company have announced $36.50 as their first quarter price on sheet bars, when the common expectation in the trade has been that the figure would not be above $35. For several years there has been no "intercompany" sheet bar price with the Steel Corporation, hence the American Sheet & Tin Plate Company will pay this price along with the independent mills that have long standing agreements with the Carnegie company. The company does not sell sheet bars in the open market, but independent sellers are usually governed by the price. The net influence of the announcement is to increase further the prospect that the regular sheet and tin plate price will not be shaded, as $36.50 bars affords a very small margin for the finished operation.

Pig Iron and Coke

Both coke and pig iron have had important developments. Connellsville furnace coke was expected to advance in December on account of prospective snowstorms and cold snaps slowing down railroad operations, but the weather has been good and consumption has not increased in full keeping with the constant increase in production. The result is a slight curtailment in coke production, the first for a long while, and declines in prices. Spot furnace is $6.50 to $6.75, making 50 cents decline in one week and 75 cents in two weeks, while shipment to January 1, which had been held at a stiff premium, can be done at around $7. Foundry coke is off fully 50 cents, at $7 to $7.50, and some rather good brands can be had at $7 for spot. It is rumored but not confirmed that fair quality has been offered for first quarter at $7.

Since about the middle of September pig iron prices have been declining, at first on account of actual declines in coke prices affecting the cost of production, but later on account of expected declines in coke which had not yet materialized. As a result, with furnaces operating lately under contracts for coke at $8 or higher to the end of the year, they have been shipping pig iron at less than production cost, though at prices that might give them a good profit at some indefinite time in the future when coke is available at something like a reasonable price.

Until the past few days the pig iron market was entirely one-sided, consumers buying very sparingly and only for pressing requirements. Now, with additional price concessions, they have begun to take hold for first quarter. One interest set out to sell, as a backlog, one-third the first quarter output of a valley furnace making foundry iron at $25, furnace. About 10,000 tons were sold and then this interest withdrew the price, but others will no doubt make it. The carload market is at about $26, against $27 a week ago. Basic has declined from $25.50 to $25, valley, without inducing much buying, and a somewhat lower price is in prospect. Buyers think the turn may be near at hand and that in any event they cannot lose much in covering part of their requirements as there is little room for further declines and it is well to be on the safe side with part of the tonnage. Bessemer has declined from $28.50 to $28, valley, and is inactive.

CALCULATING THE POWER

(Continued from page 20)

that are made by ordinary machine shop methods in small quantities or singly. These gears are not usually made with fixed tools. The holes are generally bored instead of reamed, and other lathe work is done to scale and calipers, not to stops and gauges. The tolerance needed for such operations is therefore much greater. Just what the result will be depends most on the general tone of the shop and the standards for quality of workmanship that exist in the minds of the foremen and leading hands. This is one of the most difficult things to build up in a shop organization, and one of the most valuable when obtained. Some shops have the spirit of quality,—quality suitable to the purpose, of course,—so ingrained in their organization that their product is their advocate and advertisement wherever it goes. With others—large and prosperous, some of them—the reverse is true. It would be invidious to mention names of the first, and improper here, of the second, but it may be said that the cut gear and gear cutting machine industries furnish several interesting examples in both classes. Fortunately, the average lies nearer the first and progress is in that direction.

PRACTICAL APPLICATION

(Continued from page 19)

variation will be apparent in the distance between the two lines. The simplicity of this also suggests possible developments in the direction of improved method of measuring horsepower under actual running conditions, since with a shaft of given dimensions and material the angular displacement or torsional strain bears a constant relationship to the load applied.

As indicating the practical applications of the oscilloscope, the accompanying illustrations may be of interest. Thus in Fig. 2 the equipment is shown attached to the half-time shaft of one of the latest types of engines, the object in this case being to examine the working of the valve gear. To attach the primary shaft of the gear box to the desired part, a simple form of adapter is supplied. Some difficulty may, of course, be experienced in the examination of parts which must necessarily remain enclosed, but in this connection it may be mentioned that a considerable amount may be seen through a very small aperture, since the light may be projected in any desired direction, whilst the images formed are perfectly clear and definite.

The last-named point will be appreciated on referring to Figs. 3 and 4, which are reproductions from actual photographs of the headstock of a sewing machine running at approximately 1,500 r.p.m.. In the case of Fig. 3 it will be seen that the moving parts present the usual blurred appearance which precludes the possibility of visual examination of the majority of the components. In Fig. 4, however, every part is distinctly visible, although during the time of the exposure necessary to secure the original photograph the machine made upwards of 2,000 revolutions.

Incidentally it may be mentioned as a curious fact that in general the clearest images are obtained when the mechanism is running at the highest speed. This, of course, is due to the fact that a greater number of like impressions are registered in a given time.

ECONOMIC ESSAY CONTEST

Actuated by a desire to advance the study and more general appreciation of economics, Alvan T. Simonds, president of the Simonds Saw Co. of Fitchburg, Mass., and Chicago, Ill., proposes an essay contest open to pupils of high schools and normal schools in the United States and Canada. Mr. Simonds offers two prizes of $1,000 and $500 for the best essays written by students on the subject: "The Lack of Economic Intelligence and some of the injuries it has caused individual and general welfare since 1860."

Mr. Simonds hopes this contest will interest many in the study of economics, who might otherwise pass it by. He also expects it will aid in creating a public sentiment that will result in the practical study of the subject in secondary schools as part of the training of every teacher. By way of suggestion, the donor of the prizes points to the fact that unemployment, hard times and business failures are economic disorders, which, like the diseases of the human body, can be avoided by greater economic intelligence. The essays which Mr. Simonds anticipates should deal with facts of this kind as well as explain concrete examples of injury to individual or general welfare, due to lack of economic intelligence. The readiness of many to accept economic fallacies and to act upon them is another phase of the subject writers may dwell upon.

As a foundation from which the essays may be constructed Mr. Simonds suggests that facts and example which bear on the subject should come from Canadian and American history since 1860 with special emphasis upon the present. Rules governing the contest have been prepared, and persons interested may obtain copies of them by addressing the Simonds Economic Prize Contest, 470 Main Street, Fitchburg, Mass.

SELECTED MARKET QUOTATIONS

Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.

PIG IRON

Toronto price:—

Silicon, 2.25% to 2.75%	$30 80
Algoma, No. 1, Montreal	33 15
Summerlee, Scotch, Montreal dock	35 00
Summerlee, Warehouse, 5-ton	40 50
Carron, Montreal docks	35 00
Grey forge, Pittsburgh	26 77
Lake Superior, charcoal, Chicago	36 15
Standard low phos., Philadelphia	37 00
Bessemer, Pittsburgh	32 77
Basic, valley furnace	25 00

METALS

	Montreal	Toronto
Lake copper	$17 50	$17 25
Electrolytic copper	17 25	17 00
Castings, copper	17 00	17 00
Tin	45 00	41 00
Spelter	9 50	9 50
Lead	8 00	7 50
Antimony	7 50	9 00
Aluminum	22 00	22 00

Prices per 100 lbs.

News From the Industrial Field

Ford Motor Company, Detroit, has removed oil burning apparatus from boilers in Highland Park plant and is again using coal for fuel.

Foreign pig iron arrivals at Philadelphia during the past week totaled close to 21,000 tons, the largest tonnage since heavy import movement started.

In the first eleven months this year Clyde Shipbuilders launched 113 vessels, totaling 369,326 tons, which is 52,500 tons behind last year and 260,000 behind the largest output of the yards.

In the motorizing of machinery in the Ford plant at Walkerville and in the new extension, as proposed, the motors will be of the direct current variable speed type of various sizes for the equipment of each tool.

A Japanese firm of copper producers and electricians have agreed with a German firm for erection of a $5,000,000 factory to be built between Tokio and Yokohama. The Germans are contributing certain inventions in exchange for 20 per cent. of the stock. The factory will be under German management.

Port Arthur, Ont.—With twenty-three vessels in port one day recently the Port Arthur-Fort William harbor presented a scene of great activity. Fifteen of the largest vessels on the lakes were loading grain; twelve vessels were expecting to clear during the day, taking out 3,225,000 bushels. This is the largest single day's shipment by water so far this year.

Motor vehicles registered in Canada during the year 1922 numbered 470,000, as compared with 402,029 cars in 1920 and 2,100 cars in 1907, according to the latest government figures. During the past four years the car registration in Canada has almost doubled, and the Dominion now holds second place in per capita possession of automobiles—about one car to every eighteen people.

Passenger steamers in the Canadian service head the list among the large steamships built during the year, according to Lloyds Register of Shipping report, just issued. Thirty-two ships exceeding 10,000 tons are listed. Of these the Canadian Pacific "Empress of Canada," 21,517 tons, in service between Vancouver and the Orient, was the largest Canadian steamship.

That an American firm is willing to erect a one-million dollar plant and employ about 2,000 hands in Scarboro if water at reasonable rates can be supplied is the statement of J. Kennedy of the Scarboro Industrial Committee. He says further, that the firm has searched a radius of thirty miles, and had found a suitable site there. The amount of water they will use is 1,500,000 to 2,000,000 gallons per month at the start, and will later require 4,000,000 per month. In New Toronto the price to manufacturers is 10 cents per thousand, but in Scarboro it is 25 cents per thousand. They have located a suitable site at about $2,000 an acre, and will require 20 acres, later extending to 65 acres.

John Irving, general sales manager of Nova Scotia Steel and Coal Co., is dead. Mr. Irving was president of the Hattie Gold, and while visiting the property he contracted a severe cold which resulted in his death. He was at one time a resident of Toronto and was a member of Toronto Lacrosse Club.

The twelve-hour day and the type of worker it produces have outlived their usefulness in American life, President Harding is quoted as saying in a statement made public recently. He adds:—

"The old order of the twelve-hour day must give way to a better and wiser form of organization of the productive forces of the nation, so that proper family life and citizenship may be enjoyable suitably by all our people."

Newfoundland.—Subject to ratification by the Newfoundland legislature the Premier of Newfoundland has concluded an agreement of settlement between the Reid Newfoundland Company, the Government of Newfoundland, Armstrong, Whitworth, Ltd., and the British Government, the outcome of which is expected to be the erection of a pulp and paper plant at a cost of $18,000,000, which will outrival the famous mills established by the late Lord Northcliffe.

Exports of pulp and paper during October amounted in value to $9,897,356, of which $5,811,954 was in newsprint and $3,936,367 in wood pulp, $49,035 being in other kinds of paper. There were 1,631,043 cwts. of newsprint, and 1,147,199 cwts. of wood pulp shipped. The United States took all but 146,862,000 cwts. of the newsprint exported. As compared with September there was a falling off in the exports of wood pulp, but an increase in those of newsprint.

A despatch from London, states that several French industrialists are negotiating with German business men, with the object of establishing a big metal trust in Central Europe under French leadership, says a Central News despatch from Berlin. "The leading spirit of the movement," the despatch says, "is stated to be Eugene Schneider (the French steel magnate), who, having a dominating business power in Italy, Jugo-Slavia, Czecho-Slovakia, Austria, Luxembourg and the Sarre, desires to subdue the operations of the German syndicates. He is said to contemplate a trust surpassing in magnitude even the United States Steel Corporation. "The captains of German industry hope that if the plan succeeds this form of Franco-German co-operation will have an effect on reparations."

Crane, Limited, Toronto, expect to occupy, by Jan. 1, their new three-storey office and warehouse, Front St., West, which is to cost $125,000. Architects are Wm. Steele & Sons, and the contractors, Anglin-Norcross, Limited, Toronto.

Victoria, B. C.—All over the province lumbering operations have taken on a new lease of life, and an interesting development in this connection is the erection of a railway line, forty miles long, on Vancouver Island for the Victoria Lumber and Manufacturing Company. It will open up some of the finest timber stands on the Island. To consume the enormous supply of timber tapped by this railway the company proposes to increase the capacity of the mill at Chemainus to 1,000,000 feet a day provided the lumber market remains good.

Montreal.—Mount Royal Metal Co are moving to their new plant, corner Mill and Oak sts. They have been in existence for 35 years as manufacturers of solders, babbitts, type metal and other white metal alloys. The new plant will enable them to increase their present output considerably. The building is of concrete cement blocks with a monitor roof of steel and wood, coated with gravel. This type of roof is considered most satisfactory in carrying off gases and smoke from crucibles and furnaces. In connection with this business, though a separate organization, the National Bronze Co. has been incorporated and will occupy part of the new building. It is their intention to install two furnaces made by the Surface Combustion Co., of Philadelphia. Output will consist of brass and aluminum castings up to 800 lbs.

Manager of the Mount Royal Metal Co., is G. R. Hutchins, who is also secretary-treasurer of the National Bronze Co., of which J. R. Robb is president and H. J. Roast, vice-president and general manager. Both Mr. Hutchins and Mr. Roast are practical men, and graduates of McGill, the former in electrical engineering and science and the latter is a consulting chemist, in which subject he is a lecturer in McGill. He will have personal supervision of the National Bronze chemical laboratories.

Loss of $40,000 was caused when fire destroyed a new filtering plant at the refinery of the Canadian Oil Co., Petrolia. The plant was completed during the summer and had been in operation about two months.

Cobalt is considering the installation of an auxiliary or gasoline-driven duplication of the main water line, and a "loop main" in the business section. The auxiliary system, it is estimated, would cost $10,000.

Ruggles Motor Truck Co., London, are reported to be very busy on export orders. At a recent sales convention in Saginaw, Mich., Canadian delegates were present from as far west as Calgary and as far east as Halifax.

Montreal.—Wage reductions affecting 35,000 railway shopmen, that were imposed on Aug. 16, are to remain in force, as the result of a recent conference. The cuts range from five to nine cents an hour.

The Shawinigan Engineering Co. will construct a water-power development scheme for the Shawinigan Water and Power Co. The cost will be approximately $1,500,000.

It is estimated that ore shipments from Wabana Mines, of the British Empire Steel Corporation, to Germany for the past year will total about 700,000 tons. Officials of the company express the belief that the prospects for a permanent market abroad are now assured. Twelve freighters carrying 11,000 tons a month have been taking ore from Newfoundland to Rotterdam.

W. J. Egan, Canadian Trade Commissioner to South Africa, is now in Canada, and will undertake a business tour throughout the country. Canadian manufacturers and exporters who are desirous of being brought into touch with Mr. Egan, or who wish to interview him during the course of his tour, are requested to communicate with the Director, Commercial Intelligence Service, Department of Trade and Commerce, Ottawa.

CANADIAN-FRENCH AGREEMENT

The trade agreement negotiated by the Canadian Minister of Finance with the French Government opens the way for renewed trading between these two countries. Not only does Canada get equal treatment with the United States in the matter of trade as carried on at present by the latter country but the Dominion gets additional benefits in connection with the exportation of pulp and farm implements and asbestos. The new treaty between France and Canada is calculated to remedy a discrimination which has arisen out of the decree issued by France in March, 1921, increasing nearly all the rates of the French general tariff. Although this decree was aimed at countries with depreciated currency, it had the effect of placing Canadian goods in an unfavorable position as compared with those of the United States.

HOW STEEL COMPANIES STAND

Purchase of the Midvale Steel & Ordnance Company by the Bethlehem Steel Corporation makes a new line-up of the big steel companies of the United States in respect to their steel ingot capacities. The following table classifies the leading nine companies of the country, expressed in percentage of their ingot output possibilities, assuming that the total capacity of the United States is 50,444,000 tons annually:

Company	Per Cent.
United States Steel Corporation.	45.00
Bethlehem Steel Corporation ...	15.50
Jones & Laughlin Steel Company	5.24
Youngstown Sheet & Tube Co...	2.98
Republic Iron & Steel Company	2.77
Colorado Fuel & Iron Company.	2.26
Inland Steel Company	1.98
Steel & Tube Company of Amer.	1.79
Brier Hill Steel Company	1.19

QUEBEC BUILDING PROSPECTS PROMISING

Quebec.—Prospects in regard to the building trade for the coming year are very promising. This judgment is based on interviews with contractors and wholesale hardware men in Quebec. A feature in the New Year will be, no doubt, the renewed demand for fabricated steel and iron to be used in building construction in place of wood. It is only within the past few years that there was a demand for steel in connection with house and warehouse building in the city and district. Being the central market for timber, this material was generally used. But the many fires in the past few years, which have destroyed churches and colleges, has directed attention to steel.

Business in the city and district of Quebec has been about normal during the past year. Employment of labor has been fairly steady. Four hundred and fifty new dwellings were erected with prospects of as many more next spring. Reports from the rural districts indicate that the farmers all made money during the past five years and are now arranging for more extensive farm homesteads. This is bringing orders in plenty to the hardware trade. The Quebec farmers are beginning to go in for farm machinery to equip their farms, and there are splendid possibilities for this line of trade. The provisional government is generous in its assistance to the farmer, who is enabled to borrow money on easy terms. On the whole, the coming year promises to be a banner one so far as building is concerned.

Proper storage of patterns is essential to profitable manufacturing. This, usually, is expensive equipment and replacements and repairs should be reduced to the minimum.

McAVITYS' TO HAVE NEW CENTRAL PLANT

St. John, N. B.—The firm of T. McAvity and Sons, Limited, one of the leading machinery manufacturing concerns in the maritime provinces, is gradually removing its widely separated plants in St. John to one centralized plant. The new plant consists of three buildings of one story, of steel, concrete and glass, with the roofs and parts of the sides of each building entirely of glass.

For many years part of the machinery plant of T. McAvity and Sons, Limited, has been in the south end of St. John, where it was known as the Vulcan Machine Works. This group of buildings has been closed to manufacturing and is now being used as a group of war houses. The work of removing the plant was effected in a week. One of the new buildings has been devoted to the former Vulcan works.

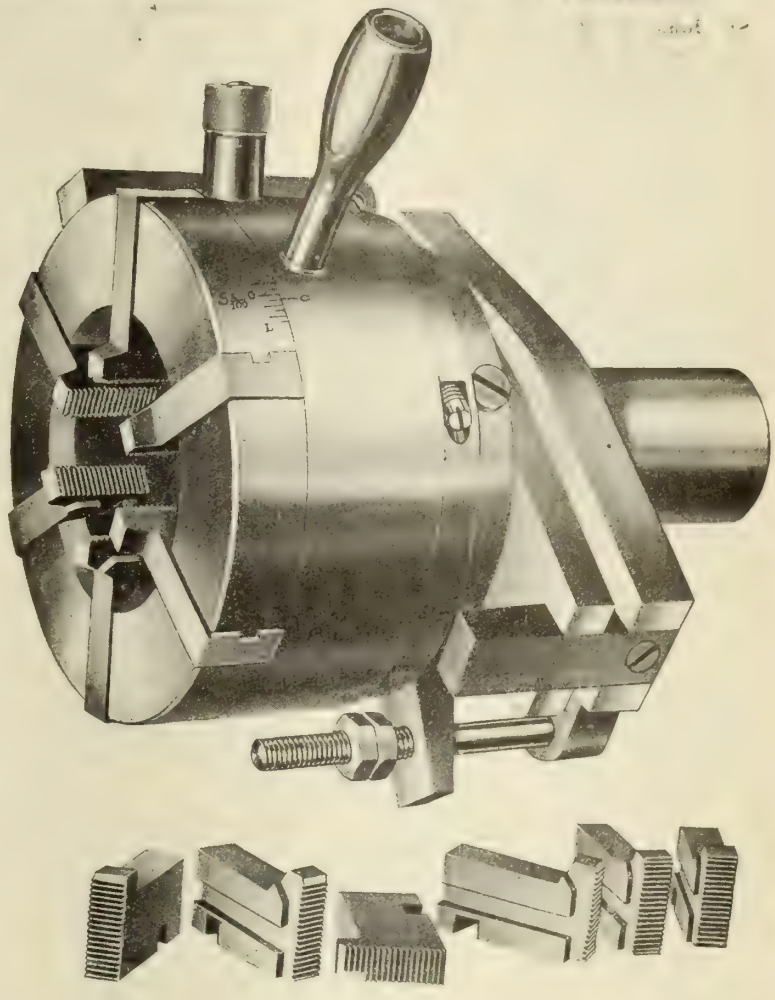
During 1923, it is expected that all of the manufacturing plant of T. McAvity and Sons, Limited, will have been removed to the new location. This will include the plant on Water Street in St. John, on the waterfront, which has been in existence for sixty years. In this plant brass machinery of different kinds is manufactured. T. McAvity and Sons produce hydrants, pumps, valves, boilers, pipes, etc.

The firm was founded by the late Thomas McAvity and later Mr. Avity took his sons into partnership with him, including, the late James H. McAvity, Thomas McAvity, Jr., George McAvity and Stephen McAvity and John McAvity. For many years, Thomas McAvity Jr. has not been active in the business of the firm. The active head of the manufacturing department of the firm has been George McAvity, who also directed the operations of the firm during the war period, when shells were largely manufactured by T. McAvity and Sons, for four years.

The new plant is located near the eastern gateway to St. John. A spur line of the Canadian National Railway connects the plant with the main line of the road which is but a few hundred yards away. A short distance from the plant are the new Courtenay Bay docks and the new dry dock.

At one time the terms "wrought pipe" and "wrought-iron pipe" were virtually synonymous, as all pipe was originally made of wrought iron. The use of steel pipe, however, has increased so rapidly that now about 90 per cent. of the wrought pipe manufactured is made of steel. According to the National Tube Co., "wrought pipe" is a term that is applied to both steel and iron pipe, and a man who advertises that he is a dealer in wrought pipe means that he sells pipe made of both materials. The term "wrought-iron pipe" means that the pipe is made of wrought iron, which is the product of the puddling furnace; while "steel pipe" is applied to pipe made of steel.

DIE HEADS THAT SHOULDER THE WORK



One simple way to reduce production costs is to increase production. More and more shops are becoming 100% Geometric in their tool equipment, because they know that increased production invariably follows where Geometric Tools are used.

A Screw Thread Geometrically cut is correctly produced.

Geometric Die Heads can be fitted with Chasers for cutting close to a shoulder when required.

This Geometric Die Head is arranged for the Potter & Johnston Automatics. Note the Floating Shank, which makes close Camming unnecessary and also prevents inaccuracies caused by either forcing or holding back the Turret.

When you put a Geometric Die Head or Collapsing Tap on your Screw Machine or Turret Lathe, you put the name of the Geometric Tool Company there, and thereafter **they have a record to keep with you.**

Send in Your Specifications and Let Us Match Them With a Die Head That is Right

The Geometric Tool Company

COMPENSATION LEVY SUBJECT OF PROTEST

St. John, N. B.—The Bathurst Company, Limited, Bathurst, N. B., controlling a pulp mill, three saw mills, steamship docks, 2,563 square miles of timber land, and which is building a new paper mill, all at Bathurst, has not relinquished efforts to nullify the program of the Workmen's Compensation Board of New Brunswick.

For several years the Bathurst Company, which was recently renamed from Bathurst Lumber Company, has been contesting the right of the New Brunswick Workmen's Compensation Board, to assess the manufacturers so exorbitantly. The levy is believed to be the highest of any board of this nature in the world.

Angus McLean, president of the Bathurst Company, has stood resolutely against the extravagances of the board. He has pointed out that the bulk of the aggregated amount obtained by assessments on manufacturers each year goes towards defraying expenses and salaries of the members of the board and staff. Only a minor proportion is used to pay the compensation claims that come before the body per annum. The expense items are especially heavy, and Mr. McLean believes it is unfair that the manufacturers should be forced to pay all the cost of operation for such an expensive commission, and the employee escape without being called on to pay even a fraction of what the manufacturer pays.

Mr. McLean has brought this subject before the Canadian Manufacturers' Association, and it has created much discussion among the members. At the 1922 annual meeting which was held at St. Andrews, N. B., this subject, which was introduced by Mr. McLean, was one of the leading topics of the convention.

Although the New Brunswick courts have upheld the claim of the board to collect $20,000 from the Bathurst Company, the company will not rest the case there. It will be taken to the highest tribunal as a test case. As such it will be of vital interest to all manufacturers.

SHIPPERS CO-OPERATE AGAINST CAR SHORTAGE

Improvement in business conditions has increased demand for cars, and the Railway Association of Canada is calling the attention of executives in all Canadian concerns interested in shipping or receiving shipments of goods without delay, to the necessity for public co-operation to offset the difficulty.

At the present time, it is pointed out, there are approximately 24,000 more Canadian box cars in the United States than United States cars of a similar class in Canada.

In addition to this factor of impaired railway service, the recent termination of the coal strike throws on the American railways a suddenly increased demand for cars and motive-power to move accumulated orders for coal. This makes it even more difficult for the Canadian roads to keep down the number of their cars on foreign rails.

To meet the situation, the Railway Association of Canada has made special direct representations to Washington and obtained assurances that the United States railways will do their best to hurry the return of cars; and the Canadian roads, through this Association, will maintain constant pressure to see that this is done. Furthermore, the dwindling supply of cars will be offset as far as possible by the usual effort of Canadian roads to move cars faster and farther and thereby make each car carry more in a day. In spite of the railways' best efforts, however, the shortage is becoming daily more acute.

One great factor in car economy lies out of the railways' control—and in the hands of your Shipping and Receiving Departments. If they will take pains to load more goods in each car and release cars promptly, they will help protect their plant and their neighbors' plants against the further danger of car shortage.

There was an increase of over 28 per cent. in the traffic through the Welland Canal during October, and this was almost entirely due to wheat shipments which amounted to 10,878,300 bushels as against 3,403,300 bushels for 1921. The anthracite coal passed through the canal and bituminous coal fell off 57,826 tons. In the Sault Ste. Marie canals, iron ore shipments amounted to 5,906,298 tons, as against 3,209,886 tons in October, 1921.

It must be realized that while lack of lubrication will in time always cause mechanical failures, all such failures are by no means due to this cause. Faulty metals, poor design, careless alignment or adjustment, can never be corrected by lubrication. This is certainly obvious—but it is frequently lost sight of.

The metals that can be held by magnetism are cast iron, wrought iron, malleable iron and steel. Many magnetic chucks can be used with or without water or other lubricants for cooling the work, which increases their range of usefulness.

Buying made easy

By grouping together these manufacturers of Special Machinery, Gears, Gauges, Dies, etc., we are making buying easy for you. Here you have a directory of the firms who can fill your requirements on any of these lines. When you are in need of any of the above, consult the firms listed here

CANADIAN MACHINERY

Buyers' Directory

143 University Ave. - - Toronto

$5 May Save You $500 or $5,000!

You work hard for the dollars you save. Properly invested they can be made to work hard for you. But they must be properly invested.

If you feel the need of a guide to show you how to invest your money to bring you the biggest return consistent with safety; to show you how to avoid the pitfalls of investment; you need THE FINANCIAL POST.

It will give you a personalized investment service. Its articles every week will tell you what you want to know about investing. Its discussion of current business and national problems will give you a new angle on economic and political questions. You will have too all the privileges of the Investors Inquiries Department. You may ask as many questions as you like about your own investment and financial problems—the standing of your broker, and the analysis of particular securities, insurance problems, etc. This service is free to all readers.

Stop losing money on bad investments. Invest $5 now where it may save you $500 or $5,000. Pin a $5 bill to this ad. (or your letterhead), write your name and address and we will send you THE POST for one year (52 issues).

THE FINANCIAL POST 143 University Ave. Toronto

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

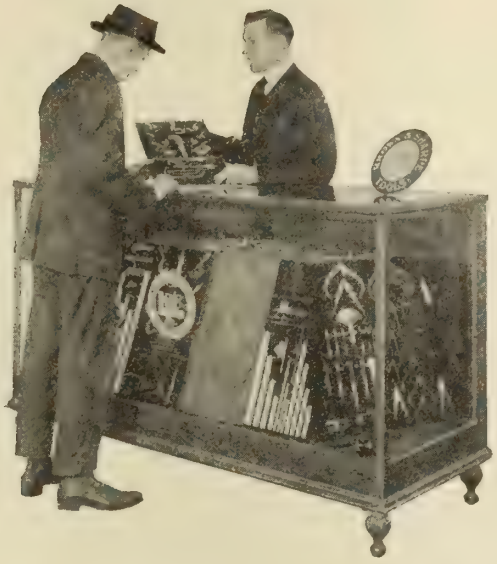
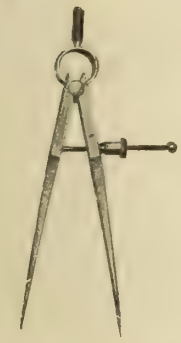
TRADE MARK



Buy it—today



This Brown & Sharpe Spring Divider No. 805 is an essential tool for layout work on cams, etc. A light, durable tool with a convenient spring nut which slides easily and clamps firmly. A handy, useful tool made in five sizes up to 6″. Ask for No. 805.

You know the tool you've been intending to buy—buy it now—today.

To the accurate, speedy, dependable mechanic, the door of opportunity is always open—a good man is more highly valued than ever.

Good tools give him confidence in his ability to do first-class work—and confidence is great help toward speed and better workmanship.

As for that Brown & Sharpe Tool you are thinking of buying—buy it now—buy it today.

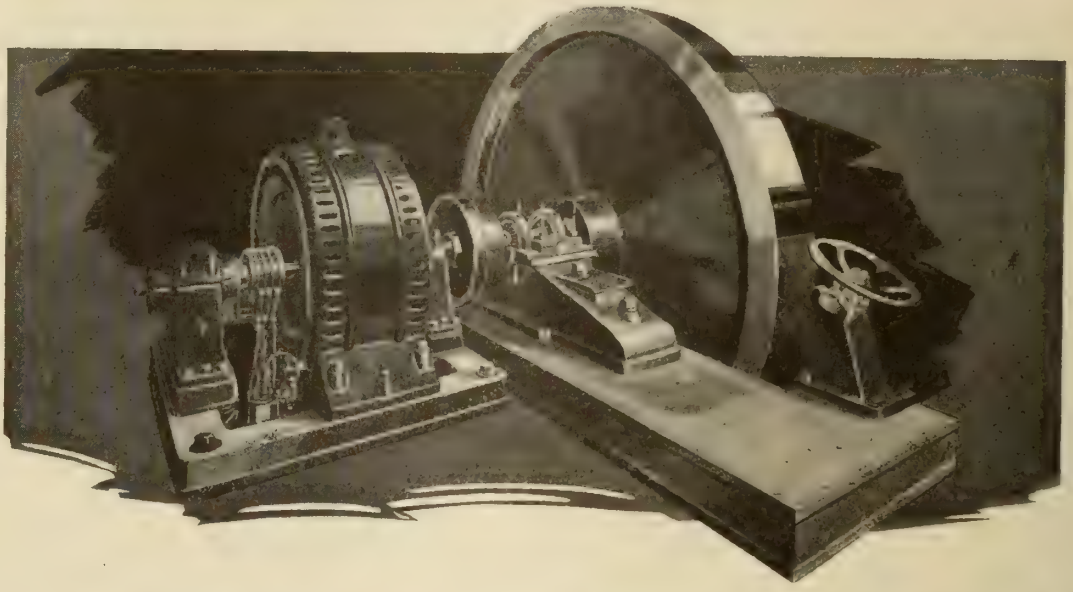
Your dealer carries it—ask him.

Insist on the name BROWN & SHARPE
It's a guarantee of Quality

BROWN & SHARPE MFG. CO.

Providence, R.I., U.S.A.

SKF



Five Hours on Its Own Momentum

--An Achievement Possible Only with Ball Bearings

FIVE hours of motion without power! Unbelievable—but nevertheless an actual fact, as demonstrated by this fly-wheel type alternator which revolved on its own momentum for five hours.

Four **SKF** marked self-aligning ball bearings are used to support the revolving parts running at 500 R.P.M. and weighing 44,000 pounds.

You can imagine then the amount of energy which the use of ball bearings, as compared with plain bearings, saves in the course of a year in any plant. Since the saving in each machine is added to that of the others, the total is no mean quantity and represents a substantial increase in plant efficiency and a worth-while economy.

When self-aligning ball bearings are used friction is practically eliminated and marked economy effected as well in lubrication and maintenance. See that your electrical machinery is ball bearing equipped.

Save Money and Machinery by Correct Storage

Save labor, be sure of clean oil, eliminate fire hazards—and buy less oil—by using Bowser Piston-Type Measuring Pump for handling oils.

Accurate measurement saves oil: Bowsers are accurate. Oil-tight construction eliminates losses—Bowsers are oil-tight. Spillage means waste—Bowsers prevent spillage. And such a battery of oil tanks as is shown saves hand labor—cuts down operating costs and overhead.

Full details, as to exactly how much money you can save per year, and how soon the Bowser equipment will pay for itself, will be supplied by our engineernig division. Ask for illustrated Folder C-13, and state your problem briefly.

Bowser equipment is

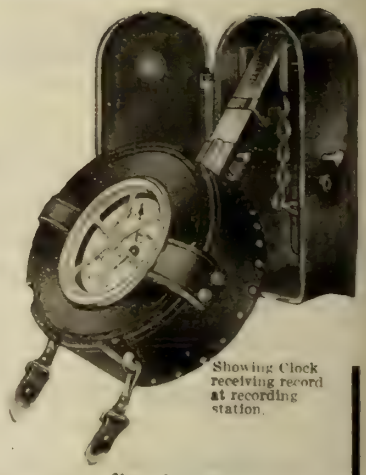
Watch Your Watchman!



Showing Clock receiving record at recording station.

WHEN you pile into your bed every night do you ever stop to realize that you are entrusting, absolutely, the source of your income to a low-salaried watchman **without proof that he is actually "on the job"?** True, you have your fire insurance, but that is merely indemnity for buildings and material destroyed. It pays you nothing for loss of production, organization and time.

The Hardinge Alert System is your Factor of Safety. It tells you, beyond argument, whether you are getting all the protection you pay for. If your watchman is "on the job," it tells you so—if he's a slacker, it tells you so. It cannot lie, the watchman makes the record himself. By his own hand he tells you whether or not he is faithful. There's no wiring, no complicated installations to the Hardinge Alert; your workman can equip your plant in a couple of hours.

Let us send you a system for thirty days' trial.
Send for Catalogue C.M.

ARMSTRONG
Safety Clamp Lathe Dogs

THIS Dog is so constructed as to combine a wide range of adjustment with the convenient features of the Clamp Dog and the Simplicity and Strength of the ordinary Lathe Dog.

It is specially adapted for use on finished work which would be liable to be damaged by the set screw of a common Lathe Dog.

A distinct advantage of this Dog is that it can be applied without removing work from centres.

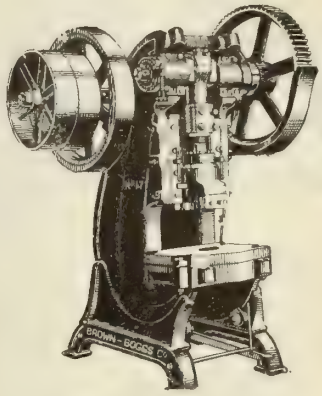
"B-B" Tools Mean Bigger Opportunities



No. 215—Power Press

Is it really Consistent Practice in times of retrenchment to cut down your men's wages and still retain machines and methods of practice that are out-of-date, slow and costly? If economy demands adjustments a good place to start is an investment in a machine that will cut down operating expenses.

That's why we urge you at this time to investigate "B-B" Metal Working Tools.

What they will save you NOW can be approximately figured by the profits they have built up in brisker days.

Rigidly tested and guaranteed—presses, dies, shears, punches, drop hammers, and tinsmiths' tools of every description.

What our catalogue does not explain we will be glad to.

Synchronizing Screw Threads By Lead Variator

Special Lathe Grinding Attachment—Tilting the Head to Suit Angle of Helix—Obtaining Uniform Lead—Odd Pitch Threads Easily Cut—Accurately Truing of Cutting Wheel

GRINDING of screw threads provides a means of obtaining a greater degree of accuracy than is possible by any other method. Rapid progress is being made in securing the same precision on thread surfaces as has been heretofore obtained, commercially speaking, only on cylindrical, flat or spherical surfaces. A grinding unit that can be used in conjunction with any machine tool is shown in Fig. 1. It is capable of service on a variety of work and is particularly adapted for thread grinding on lathes. The device is made in two styles, one for applying to the front tool post and the other for service on the rear rest of the lathe. The construction of both models is identical in every respect with the exception that they face in opposite directions. The wheel truing arm is attached to base in such a way that the thread angle is dressed on the wheel in the same plane with the axis of work centres, thus producing a perfectly formed thread. The device may be readily located to conform to the angles for "V," W. S. S., Whitworth and Acme threads.

Construction Features

The grinding spindle is carried in five precision ball bearings, adjustable for radial wear and end-thrust play. The spindle housing is on a vertical traverse plate which is indexed with graduations for setting in any angular inclination to conform to the helix angle of the thread. Means are provided for raising and lowering the traverse plate to bring the wheel centre into alignment with the work centre.

An outstanding feature is the power transmission system which is accomplished by an endless belt. This belt has a three-point contact with both the driving and driven pulleys and then travels over a compensating two-pulley arrangement which automatically keeps it at the proper tension. Arrangements for two speeds are provided.

Setting for Thread Angle

Fig. 2 shows the machine in operation grinding a thread gauge. Fig. 3 is a view taken from the rear of the machine showing the grinder head tilted to conform to the proper angle of the helix of the thread gauge which is being ground. By using two heads in combination, when working on production grinding, large quantities of duplicate pieces may be readily ground by an accurate setting of the wheels on the first piece, as the setting of the wheels is not interfered with thereafter, but the subsequent parts are brought into lead with the wheels by means of an adjustable rotating lathe dog. Wheels are beveled on one side only. Each wheel grinds only on one side of the thread simultaneously. This is an efficient method of obtaining a sharp bottom in the "V" form of thread. There being no included angle point to wear away, wheels require redressing less frequently. The effect is similar to flat grinding with a straight wheel.

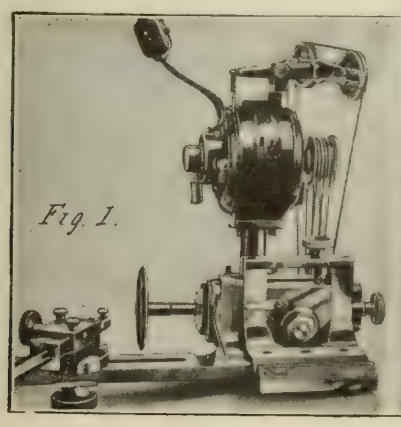

Fig. 1—General view of precision grinder.

Fig. 2—Grinding a thread gauge.

Synchronizing Thread Lead

A difficulty that is often experienced in the assembly of machinery is the working loose of studs used in supporting brackets and other parts of the machine. This trouble is largely overcome by synchronizing the two threads. Synchronized thread lead does not necessarily mean precision thread lead, but simply that both male and female threaded parts have the same lead. Under these conditions a perfect fit is assured, greater tolerances permissible on pitch diameters, for an excessive pitch diameter's error with true lead produces a continuous and safe bearing for the full length of the threaded engagement, whereas perfect pitch diameters with lead error permits of the successive shearing or stripping of threads, and to accomplish a complete entry of the stud requires a reduction of pitch diameter of stud threads. Subsequent assembly of some parts does not produce engagement of full length of threads, with the result that under work and stress, studs work loose and tear out.

Fig. 4 illustrates unsynchronized lead showing the contact on ends only, due to different leads between stud and threaded hole. Fig. 5 illustrates a thread with synchronized lead, showing the contact uniformly distributed over all the threads because the leads of stud and threaded hole are the same. Synchronized thread leads do not add expense but effect a considerable economy in production and assembly. Stock parts with synchronized thread leads match up with predetermined accuracy and result in finished products, insured against breakdown by studs working loose or tearing out.

Thread Lead Variator

Fig. 6 shows the grinder and thread lead variator installed on an engine lathe. This appliance enables a shop to produce synchronized lead by harmon-

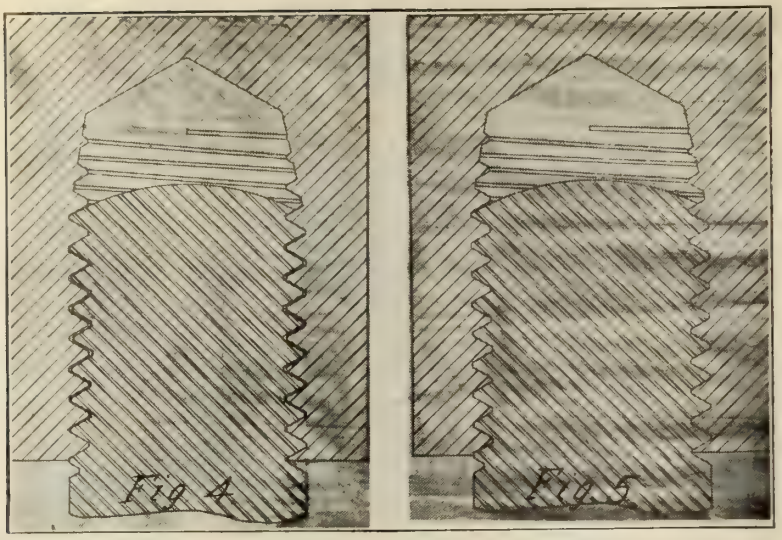

Fig. 4—Unsynchronized lead. Fig. 5—Synchronized lead showing perfect fit of thread.

izing the thread leads on existing tools. The grinder grinds taps, thread gauges, die head chasers, and all thread cutting tools. The variator gives control of the thread lead. Tools can be made to conform to stock on hand, or stock coming through can be manufactured to match taps used on the work.

The precision and thread lead variator is intended for elongating or diminishing the normal lead on lathes, and also for correcting errors in the lead of the lead screw. Likewise to elongate the lead on parts which are subsequently to be hardened, to compensate for the approximate shrinkage in lead, eliminating correction grinding in non-precision work and reducing the correction grinding necessary in accurate tool work. Metric threads, and any of odd or unusual lead, may be cut by the use of this device without requiring special or translating gears. Fig. 7 shows details of the variators.

Variator Mechanism

The stationary part of the device consists of a bracket, clamped on the ways of the lathe. This bracket is composed of two pieces, the outer frame and the ways adaptor. The outer frame is adjustable horizontally sufficiently to make the proper connection between the bracket and the mechanism carried on the lead screw. The bracket carries a swiveling rack and provision is made for vertical adjustment to bring the centre of the rack pivot in line with the centre of the lead screw. The adjustment can be locked and subsequent tilting of the rack does not disturb it. A dial is provided to show the degree of inclination of the rack.

The mechanism on the lead screw consists of a nut adjustable for size and having an extension carrying a half gear, that is free to swivel in line with the rack. The variation in the lead is obtained by the rotation of this half gear, in accordance with the angle at which the rack is set, as the nut is traversed by the action of the lead screw. Lead screw nut in the lathe carriage is not employed, but the connection is made between the variator nut and the carriage by steel cylinder. The variator nut moves the lathe carriage only during the machining operation. The return of the carriage to its initial position is obtained by a second nut, keyed in the frame of the variator nut to permit longitudinal movements independent of those making variations in the lead. A dust guard is furnished to protect the lead screw from abrasive dust, when performing grinding operations. It is recommended that the variator be positioned near the tailstock end of the lathe, as that portion of lead screw is generally but little used.

Setting the Device

In order to aid in setting the lead variator for either the normal lead of the screw or for a change of lead, a gauge block is provided. The block is used by clamping it directly upon the threaded work, it fitting all diameters up to 3 in. The block is one inch thick, so that by turning the work through the same number of turns as threads per inch required, and measuring the travel of the carriage by a dial indicator on it, adjusted to fit the block, the variation of the pitch of the lead screw can be determined. The desired pitch can be obtained by varying the angle of the swiveling rack to suit the conditions, and then locking it in place.

Deep Internal Grinding

Fig. 8 illustrates an attachment that is particularly adapted to deep internal grinding to a depth of 12 in. on holes 2 in. or greater diameter and to a depth of 6 in. on holes ½ in. in diameter. The device has a number of uses and can be mounted on machines of different types. It is shown in Fig. 8 mounted for grinding the tapered bore of a milling machine spindle. Such operations can be quickly performed so as to give perfect concentricity to the bore after it has become scored or worn. The taper of lathe spindles can be ground in the same manner with the head mounted on the tool post. Besides grinding deep holes in jigs, fixtures and other work, holes that are difficult of access because of projecting obstructions can be easily reached. The extension housing is screwed directly on the threads at the front of the spindle cap of the grinder. The extension spindle couples on the end of the regular spindle by means of a tapered joint. It is supported by double radial and end-thrust ball bearings at the extreme outer end of the housing.

Wheel Truing Head

Fig. 9 shows the wheel truing head on the multi-graduated precision grinder. The principal feature of this head is that

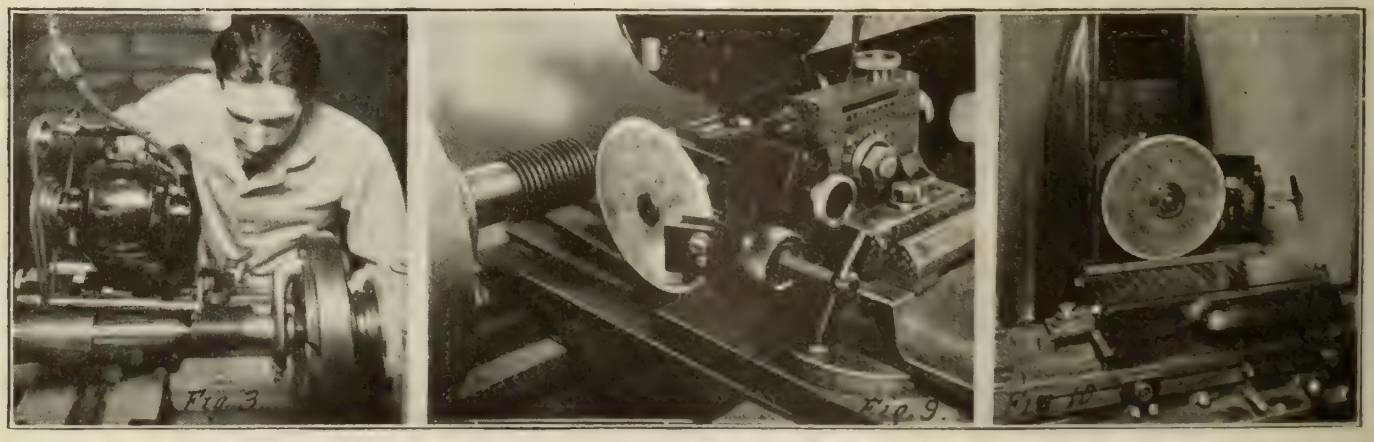

Fig. 3—Grinder tilted to conform to thread helix. Fig. 9—Wheel truing head. Fig. 10—Head in operation on B. & S. grinder.

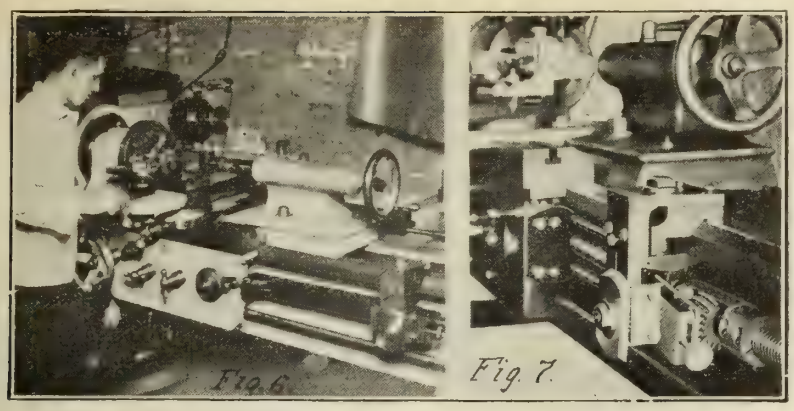

Fig. 6—Thread head variator on engine lathe. Fig. 7—Details of variator.

of keeping the wheel always in correct alignment with the lead of the thread being ground. Further, it is feasible to dress the "V" form on the wheel to a sharper point, facilitating the grinding of much finer pitch threads than usually considered practicable. Likewise there is no limit to the length of commercial thread which may be accurately ground, as the grinding wheel may be trued while grinding. The infeed for the head being graduated in thousandths of an inch, allows the grinding attachment to be fed in the same amount as the wheel diameter is reduced by wear and dressing.

Setting Diamond Dressers

The form dressed on the wheel is always in line with the axis of the work centres, as the diamond holder head is graduated in degrees corresponding to the spindle graduations on the grinder proper. For illustration, if the spindle is inclined five degrees to correspond with the helix angle of the thread being ground, the diamond holder is set at five degrees, opposite direction which brings the dressing head perfectly horizontal with the work centres. The traverse of the diamond is obtained by operating the double ended handle on the extended threaded shaft. The diamonds do not cut the wheel simultaneously but in progressive order. This is done for the reason that if one diamond should become dull it would cause the wheel to spring away and the other and sharper diamond would gouge the wheel and both diamonds would become heated. The diamonds are positioned at an angle of 10 deg. and after a slight amount of wear, can be rotated a small fraction of a turn, presenting to the wheel a new sharp point which will always be sharp, and this can be continued until the diamond is worn down to its setting. A stop is provided for regulating the return traverse of the two diamonds. This stop can be utilized for predetermining the amount of flat desired at the bottom of the thread angle, insuring the same amount of flat regardless of re-dressings and without subsequent re-gauging. By using this head it is practicable to use an 8 in. dia. wheel, reduce the grinding time proportionately and produce more accurate work with ease and certainty.

Fig. 10 shows the head in operation on a Brown and Sharpe surface grinder, using a 10 in. wheel, grinding thread chasers. An even depth of cut is maintained by lowering the regular grinder head to correspond with the reduction of wheel diameter on each truing. This combination is also applicable to grinding flat thread rolling dies.

The use of these precision thread grinding devices supersedes lapping in finishing gauges and precision threads, producing more accurate and uniform work with a better finish, at greatly reduced cost. By using the grinder on a lathe equipped with a relieving attachment, relief on hardened taps and hobs can be readily obtained. Ground taps usually have a much longer life, hold their cutting edge better, and produce more accurate work. Spindle threads of new and used lathes and milling machines can be accurately ground and this promotes concentricity of work, and is an efficient and practical method of correcting hardened spindle threads.

Article compiled from illustrations and data supplied through courtesy of Precision and Thread Grinder Mfg. Co., Philadelphia, Pa.

EFFECT OF U. S. TARIFF ON METAL PRICES

The importance of Canada as a source of mineral wealth, as yet only partially developed, and the proximity and extent of its natural market, the United States, has prompted an investigation into the possible effects the new United States tariff might have on the trade in minerals between the two countries. On certain items of the metal group the possible effect of a new tariff was discounted a week or two before the bill became law, but the full effect of the new rates has only been definitely determinable recently.

Aluminum:—From Canada during the year 1921, 3,259,893 pounds of crude aluminium were imported into the United States, on which the tariff has been increased three cents per pound to five cents. On this commodity the full increase in duty has been met by the market since the domestic aluminium producer has made two price advances on ingot aluminium totalling three cents per pound, since the law became effective.

Ferro-silicon:—During 1921 the United States imported 7,409 tons of ferro-silicon from Canada, valued at $363,702, or nearly $49 per ton. At this rate the duty-paid value, with duty at 15 per cent. ad valorem, amounted to $56.35 per ton. The new rates of duty range from two cents per pound of silicon content, where less than 60 per cent. silicon, to 8 cents per pound, so that on 50 per cent. ferro-silicon the duty amounts to $20 per ton. The price of this grade of ferro-silicon has therefore advanced from $55 before the passing of the new Act to $75 per ton, delivered with duty paid, and as a result importation of this product has practically ceased.

Zinc:—The duty on zinc was increased from 15 per cent. ad valorem to 1¾ cents per pound specific, and while this increment has stimulated production in the zinc industry of the United States, the acute shortage in Europe has caused such heavy purchases of United States zinc for export to Great Britain and the Continent that prices, both in the United States and in London, have risen to the highest levels in two years.

Lead:—The duty on pig lead was advanced from 25 per cent. ad valorem to 25 per cent. specific, and the demand in the United States has been so heavy and domestic production has gained so slowly that the entire increase in duty has been discounted, in the face of a higher world market, and supplies of Mexican lead are being imported on a large scale.

Manganese:—The heavy duty now levied on manganese ore was anticipated and heavy purchases were made prior to the signing of the bill. The market is now nominally quoted at the old price plus the duty.

Carbon ferrochrome:—Before the tariff was enacted 4 to 6 per cent. carbon ferrochrome was quoted 12 cents per pound by domestic makers and 10 cents by importers. Since the passing of the Act domestic alloy can still be bought at 12 cents, but importers have advanced their price to 12 cents duty paid.

NEW METHODS IN KNIFE MAKING

A short time ago the British Cutlery Research Association held an exhibition of modern methods as applied to the cutlery trade. The exhibits included the latest machines used in Great Britain in the manufacture of pocket knives, table knives, razors and scissors. One of the novelties shown at this exhibition was a machine which electrically welds table knive blades to steel handles. The handles are hollow and are produced and ground by machinery and are so constructed as to combine balance and lightness with durability and good appearance; above all, a low price. Still more interesting was the demonstration of the latest discovery in electro-plating. It is the method by which silver, copper, nickel, iron or steel can be plated with chromium.

Making Machine Tools and Making Money

Lack of Contact Between Business and Economics—Latter is Essentially Commercial—Should be Applied to Everyday Life—Sources of Demand Analyzed—Place for Engineer Salesmen

*By ERNEST F. DU BRUL

IT IS truly regrettable that instead of economics being recognized as the human, humane science that it really is, instead of it forming a valuable part of the business world's working knowledge, we find it considered, and for the most part still taught, as some form of esoteric mental gymnastics for college students. It is high time that both economist and business man take effective steps to bring economics into its own proper place.

In a recent address, Dr. Wesley C. Mitchell said that "engineers no doubt can and will contribute greatly to the solution of economic problems, to which they bring a special type of training which should enable them to see many things wanting or awry in the economist's conceptions. By constructive criticism they may make the economist's contribution more effective and in working with economists they may learn some things of advantage to themselves." As one working with both elements I can add a hearty "Amen" to that statement. More than that, I would appeal to both elements to give sympathetic attention to what each has to offer in the way of constructive criticism.

Lack of Contact

In puzzling out reasons for the lack of contact between business and economics, I have concluded that it is because, in sales terms, business has not been sold on economics.

To the suggestion that economic science deserved being "sold" to business, an economist of the academic type gave me the shocked response: "Why, that would commercialize the science, and destroy its cultural value in our course." To my unacademic mind, economics like engineering, is essentially commercial. I think it could be made decidedly more cultural than it is now, if more teachers taught is as a science of living humans, instead of as though it concerned an economic specimen preserved in academic embalming fluid. Far from shrinking at the fling of commercialism, I am for selling economics to the business world, as we have sold chemistry, physics, mathematics, geology, and other organized divisions of human knowledge.

Must Create Demand

We business men have learned that to procure consumer acceptance for our goods, we must hunt out, run down, coax, stimulate and manipulate our demand. We have learned that such acceptance depends

1st—On the sales effort made, its attractiveness and effectiveness.

2nd—On the service we give our customers to keep them sold after we have reached them.

3rd—On the effective utility of the goods we have to sell.

4th—And least perhaps, on the price we ask.

Perhaps the consumer acceptance of economics is so low because the sales effort has been very slight, the attractiveness and display of the goods has been poor, the service to the user has been bad, the utility has not been apparent; and perhaps all these made for a low price that was an index of inferiority.

In analyzing a sale we business men have also learned the four steps through which we must lead our customer's mind to accomplish the desired transfer of our goods to him and his money to us. These are:

1st—Attracting attention.
2nd—Arousing interest.
3rd—Creating desire.
4th—Inducing action.

Prefer Ease to Hard Work

Wherein have the purveyors of economic science failed in these? As to attracting attention, many of the best of our economists seem to prefer academic retirement and ease to the hard work necessary to popularize the science. They may have a mistaken notion that it is unscientific or unprofessional, or undignified, to make a science so popular as to effectively promote its application to every day life. If any science ought to be, and can be made popular it is economics, the one that deals with getting our living.

The opportunity of arousing interest in economics is ever present. Business men are always interested in the question "How is business?" Their wives often talk about the domestic labor supply. Working men think a lot about jobs and wages; politicians and citizens think about taxes, and the gathering and spending thereof. Even professors worry at times about the cost of living and whether the latest drive for endowments will be successful enough to increase their own salaries. It would seem very noble to do everything possible to direct this general interest toward instructive rather than destructive action.

Economists have evidently not created much desire, much appetite for economics; and Dr. Hollander, president of the American Economic Assn., gives testimony that in the great war crisis they did not induce good economic action. Perhaps it is because they have not presented their wares in an attractive, appetizing manner. Dealt out as dry, unpalatable brain fodder, economics cannot have as strong an appeal as if served in the form of a sparkling beverage to quench a human thirst for knowledge. Because it has been subjectively treated, it sems to me that the quality of the wares has been defective.

It is a fatal defect in economics to assume as true for the whole, what business experience proves to be true only for a part, or to assume as true at all times things that are actually true only a part of the time.

Must Consider Human Element

Men, of course, think only as they know, and of course they write as they think. Few writers of economic tests have had business experience. They mostly have but limited knowledge of fabrication and exchange. Their personal exchange experience is limited to purchasing the most evanescent of all goods—food, clothing, shelter. So they subjectively formulate laws of supply and demand from that consumer angle, and apply that formulation to a mere abstraction, the economic man, buying and selling goods and services in a perfect economic market. But this method takes no account of the human element swayed by caprice, and favoritism, and hampered by ignorance and folly. According to this theory the seller always extracts the last penny of profit from every sale. Every business man knows that if he tries to do that he will have to hunt so many new customers that his strictly economic selfishness will kill him off as a business factor.

Take the absurd expressions, "normal price," "normal wage," "normal profit," "normal business." The "normal price" notion leads people to chasing price-fixing rainbows, meanwhile baying the word "Profiteer." The "normal wage" notion leads unions to attempt to level up wages regardless of efficiency. The "normal profit" notion leads to envy of superior capacity that can make two healthy blades of grass grow where most competitors can only get a sickly sprout. The silly "normal business" notion leads men to run their business craft aground when the tide of demand goes out. That fallacy of a normal business has destroyed much wealth and wasted much human effort. Men have complacently considered a boom quite the normal thing only to be-

*Author is General Manager National Machine Tool Builders' Association, Member American Economic Association and Associate, A.S.M.E.

wail the abnormality of the succeeding depression that their complacency brought on.

Striving for a fallacious simplicity of statement, economists have sacrificed clarity of thought, in formulating so called Economic Laws. The subjective method developed a formalism that led men to believe that the so called Law of Supply and Demand was something external, universal and automatic in its operation like the law of gravity, and that business simply consists of fabricating goods and making a price that takes the goods into consumption. The business world never could and never will recognize that sort of purely imaginary market.

As Applied to Flivvers

Every business man knows that fabrication is not difficult, but sale at a profit is difficult. It is not impossible to start a new automobile factory and make a better car at a lower cost than the flivver, because the limit of invention is not yet in sight, and Mr. Ford is still a human being, in spite of all attempts to deify him. Suppose such a factory were started, and its owner, counting on the automatic operation of the law of supply and demand, were to make a lower price than Ford's, and just wait for customers. Would he find Emerson right, that clamorous buyers would beat a path to his door, elbowing each other out of line to secure one of the new cars? Personally, I would bet on the Ford sales organization putting more flivvers on the road, at a higher price.

Again, the usual generalization is fatally defective when a depression comes on, when nobody wants to buy at low prices, or a boom develops, when every one wants to buy at high prices. The usual explanation of these things is, "Well, that is abnormal. It just cannot be explained by the formula." Another important fact is that the relative elasticity or inelasticity of demand in its response to price movement, is vitally different for different commodities at all times, and is different for the same commodity at different times. Economic theory has concerned itself but little with the effects of this inelasticity in different businesess.

England's leading economist, Alfred Marshall, seemed to think that only in the case of a coffin maker working for a local poor house, would it be impossible to stimulate demand by lowering prices, and that with this limited exception, the law as formulated by him is universally true. Yet manufacturers of producer goods, like industrial machinery of all kinds, whose yearly product amounts to hundreds of millions of dollars are precisely in the same boat with this coffin maker, and unless they manage their business craft according to actual facts and not by generalized errors, they are sure to lose their ventures. The whole mechanical engineering profession is largely affected by this little considered but very important characteristic of inelasticity of demand for some goods. Making plant equipment of all sorts constitutes a very large part of total production from year to year, and each year it constitutes an increasing part.

Demand From Three Sources

How many engineers recognize that such a business cannot be continuously operated according to the notion of a "normal," because of the nature of its demand? Demand for production machinery is entirely secondary, depending on the demand for the product of the machine, and becomes effective in orders, from three sources:

1st—from wear-out.

2nd—from expansion in the market for the machine's product.

3rd—from improvement of the machine reducing the cost of the product.

Unlike demand for food, there is little recurrent demand for machinery. Well-built machines are relatively long-lived so that actual wear-out is slow, and as improvement is always proceeding there is a diminishing market each year for old types of machines.

Expansion demand comes on only when the machine builder's customer is starting a new shop or is putting in additions to his capacity to take care of prospective increases in his own demand. This is done only well along in the prosperity stage of a business cycle, and it stops before the boom is over, as soon as the user sees his own temporary satiety point looming up. Obsolescence or improvement demand is largely an expansion demand, since it involves greater production per machine. Expansion demand comes on late in the cycle because most men lack both the money and the courage to expand their plants during depression. The consequence is that a machine industry's order curve would show relatively sharper peaks and wider valleys, than consumer goods demand would show. For good reasons, until the particular cycles of the machine-using industries are controlled, buyers will mostly continue to place their orders in that fashion, and will not be tempted by the low prices made in a depression to do otherwise. The machine builder and his employees can feast only as the buyer spreads the feast.

Not knowing much of the practical effects of this inelasticity, but assuming that all demand can be made to respond in the same theoretical way, to a reduction price, men like Professor Commons gravely propose an absolutely uneconomic scheme, **falsely but attractively labelled "Unemployment Insurance." It is not insurance at all, because it does not distribute the risk of unemployment over a considerable base or over a considerable time. It concentrates the risk on the last employer unfortunate enough to be compelled to lay off a workman at a time when jobs are scarce in his locality and industry.**

Certainly conditions of demand and supply for machinery are decidedly different from those for butter. So, even though this scheme which it is proposed to apply to all employers alike, might work no great hardship on a butter manufacturer, that is no good premise for a conclusion that its effect would be beneficial in the machine industry. Such sciolism is coupled with a praiseworthy desire to do a really constructive thing—to provide a reserve out of which workers can better support a business depression. But the good motive does not cure the bad logic that is being used to further this uneconomic legislation in Massachusetts and Wisconsin at this time.

Is it any wonder that business is not sold on that kind of economics? Can business be blamed for scoffing when such manifest fallacies are gravely put out for public consumption by an economist of some standing, without much, if any, criticism from his confreres? Unfortunately it is just such economic stuff-and-nonsense that attracts the attention of the unthinking mass, and arouses their interest. It is easy to create desire for something that looks so easy to get, at some one else's expense, and to induce legislative action regardless of logic and real economics. And so the sale is made—here—and in Russia. Then, when private initiative is so hampered that industry withers, the public finds—too late—that it was "sold" in the sense the bunco men use the term.

Engineer Salesmen

Good economics does need selling of the right kind, to replace the spurious goods mostly current on the market. To do that sort of selling will require men of the engineer type, who are now preferred to the superficial hand-shaking type where any project of importance is afoot. The engineer salesman with a professional, scientific background knows his goods, and their application, and knows how to engineer the sale. I believe that when the engineer takes up economics seriously, he will want to sell it to business, and he will keep business sold on economics in the proper way. As the engineer is essentially one who carries out the application of other sciences in the furtherance of human welfare, perhaps we should call this class of man, an economic engineer.

A BUSINESS EVOLUTION

Forty publishers of morning newspapers met in Chicago a couple of weeks ago and formed an association to promote the morning newspapers' interests in competition with the evening newspaper as an advertising medium. The chief method by which they say they intend to accomplish this is through announcements in the business newspapers of the United States—that is papers of the type of Canadian Machinery.

This is an interesting evolution—the recognition of the place and power of the specialized newspaper.

Factors That Influence Chain Drive Efficiency

Purpose of the Spring Cushion Wheel—Recommended Gear Ratio—Best Location of Drive—Taking Care of Slackness in Chains—Tendency to Individual Drive on Machine Tools

SPRING cushion wheels are designed for reducing the irregularities in the load on chains when driving certain classes of machinery. It is usually the driven wheel and while not occupying much more space than an ordinary wheel is considerably heavier. There is an outer toothed rim with two or more inwardly projecting vee blocks arranged equidistant. The inner portion of the wheel comprises a boss and rim with outwardly projecting vee blocks also arranged equidistant. Coil springs in partial compression are arranged between these vee blocks, one set taking driving effort and another and lighter set acting as buffer springs to neutralise the recoil when the extra compression is taken off the first set of springs. The springs are enclosed by a suitable cover plate. To keep the inverted tooth type of chain in place, guide plates may be arranged either on the outside or along the centre of the chain, though, of course when used on flanged wheels, the guide plates are unnecessary.

Recommended Gear Ratio

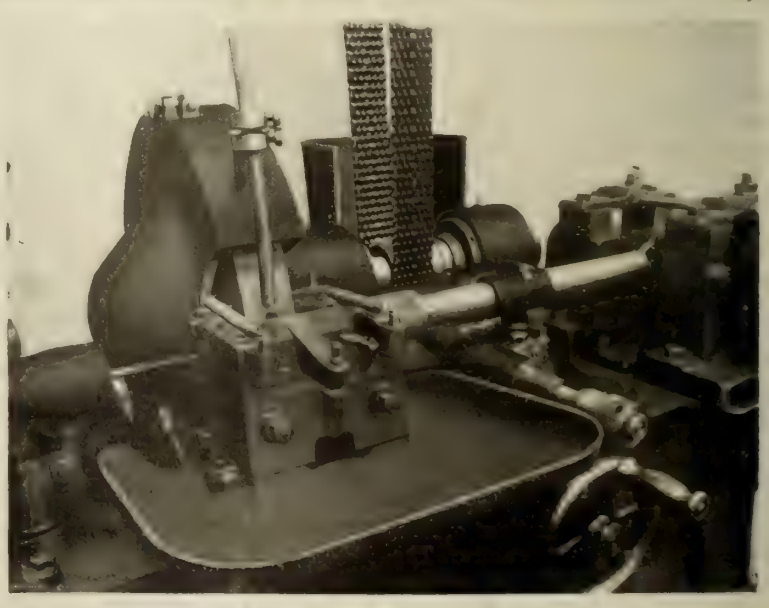
Horse powers from 1/10 to 5,000 have been satisfactorily transmitted by chains. The maximum gear ratio recommended for the roller type chain is 7 to 1 and for the inverted tooth type chain 6 to 1. For the roller type chain of ⅜ in. and ½ in. pitch the normal maximum chain speed in feet per minute is 1,000 and this is gradually decreased as the pitch increases so that for a 3 in. pitch chain 500 ft. per minute would be the normal maximum. In the inverted tooth type for ⅜ in. and ½ in. pitch 1,500 ft. per minute may be employed, and this gradually decreases to 1,200 ft. per minute for a 3 ins. pitch chain. These figures assume a sprocket pinion of not less than 19 teeth for the roller type and 21 teeth for the inverted tooth type. The desirable maximum centre distance expressed in pitches of chain for the roller type, ⅜ in. to ¾ in. is 100, 1 in. to 1¾ in. 85, 2 in. and upwards 70. For the inverted tooth type ⅜ in. to ¾ in. is 70, 1 in. to 1¾ in. 60, above 2 in. is 50. These figures apply for an ordinary horizontal drive with steady load or slightly inclined drive. The minimum centre distance should be such that the arc of contact is not less than 120 deg. between the chain and any wheel and with at least 7 teeth in engagement. Chain drives should preferably be arranged horizontal or inclined not more than 60 deg. when the large wheel is uppermost in the drive and not more than 45 deg. when the pinion is uppermost. These angles refer to the driving side of the chain and an horizontal line. It is important that the shafts should be truly parallel and horizontal.

Vertical shafts require special treatment. Wherever possible means should be provided for adjusting the shaft centres so that slackness due to a worn chain may be taken up. This prolongs the life of the chain. In electric drives, the slide rails of the motor make this provision. At least 1½ times the pitch of the chain should be allowed. If provision cannot be made, in the case of an horizontal or inclined drive, the chain may run slack until the slackness is such as to allow a link in the chain to be removed. Where the bottom side of a chain is the tight side, provision must be made to keep the two sides apart, hence the reason for large chain wheels in relation to centre distance. A chain works best with the tight or driving side uppermost and should be so arranged where a choice is possible. In all cases where there is a substantial amount of end play provision must be made to allow the chain to move laterally. Pinions should have an odd number of teeth if possible, in order to give uniform wear on the wheels and chain. Irregular loads should be corrected by the introduction of a flywheel and centre distance should also be short and the wheels as large as possible to prevent sagging. If a flywheel is impossible, the chain must be kept taut by adjusting the centres or the use of a jockey wheel or the introduction of a spring cushion wheel to absorb shock. Safety pins can be fitted in a driven wheel in the case of feed motions where damage may occur due to positive action of the chain. This shears in the event of an overload and allows the driven wheel to turn around on its shaft.

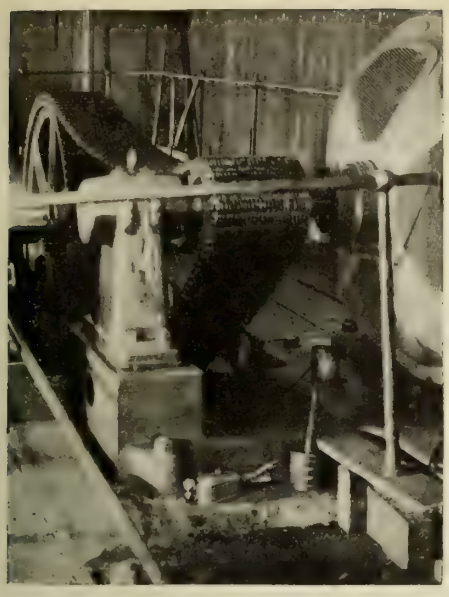
Cleaning and Lubricating

Lubrication of the working joints is essential for chain gearing. The most efficient form of lubrication is to encase the drive and pump a constant stream of oil on to the inside face of the chain from a filter pump, or the chain may be run through oil. This is essential for a chain speed exceeding 1,000 feet per minute. A drip feed lubricator may be used for slower speeds dripping on the inner face of chain, and a light or medium machine oil should be used Periodic cleaning is essential.

The drive should be thoroughly cleaned and overhauled every three months and oftener if working in damp and dirty conditions. A bath of paraffin is recommended and then a suitable lubricant, tallow or grease for roller chain, light or medium machine oils for the inverted tooth type, all wearing surfaces should be thoroughly lubricated. If the chain has not a gear case, a light screen or guard may be necessary to guard against oil splashing. When the periodical examination is made it should be seen whether the chain requires adjustment, requires clearing, whether the wheels are correctly aligned, whether undue wear is taking place or whether lubrication is satisfactory. In the chain case, the chain runs through a reservoir of oil, and the



Vertical Drive on Grinding Machine.



Heavy Main Drive.

level should be such that the lowest point of the chain will dip into the lubricant in its passing. The cases are divided, the upper half fitting inside the lower, and are dust-proof.

Necessary Conditions

When a chain is being renewed, it should be noted that where the drive is continuously in one direction a certain amount of wear will necessarily take place on the face of the wheel teeth in contact with the chain. Providing the wheel bosses are equal sided and bored parallel they should be reversed on their shafts to bring the unworn faces of the teeth into engagement with the new chain.

In addition to the numerous motor to lineshaft, lineshaft to countershaft and countershaft to machine chain drives which have been introduced in recent years both in replacement of existing drives and as new installations, almost every modern tool is now constructed so that it may be directly driven by motor. In this case the motor is self-contained with the machine, and the drive from the motor spindle to the driving spindle of the machine is very frequently by chain.

The invariable practice is to either mount the motor on a foundation plate connected to the machine or directly on the machine itself. Examples of both these methods are to be found in any modern engineering works, applying to the driving of lathes, planing, shaping, slotting, milling, drilling, gearcutting and other machines. The chain is also being developed for auxiliary drives, such as for driving the feed motion of a lathe, the power elevating gear for a planing machine, the quick power traverse of the carriage of shaping and various machines, tools etc. In some cases it is possible to displace quite a complicated arrangement of spur and bevel gears, horizontal and vertical shafts by a simple chain drive. Jockey wheels are employed to guide the chain past any desired point. The user is strongly recommended in any case of doubt to lay his information before any of the well-known makers of chain drives for their advice.

The Reason Why Belts Slip on Pulleys

IN NEARLY every plant there are some drives in use on which more or less trouble is experienced because of the belts slipping on the pulleys, and it has become quite a common practice to endeavor to overcome this by lagging the pulleys with some special covering or by use of applications which tend to hold the belts and pulleys together when they are in contact.

The results obtained by the use of these expedients can be satisfactory only to a degree for while in many cases they apparently correct the difficulty it is quite probable that a really careful investigation will bring out that the trouble which manifested itself in belt slippage has been transformed into another form which is not so evident as was the slippage and consequently is overlooked altogether. Increase in friction in bearings is one common form which this transformation takes, and the result is a decrease in the efficiency of the power unit, which not only backs up directly to the coal pile and the money box, but is a steady boarder.

It is much like trying to cure a surface manifestation of an infection by putting on a salve. You may drive it away from some particular spot, but it will show up somewhere else and will continue to do so until you remove the cause of the infection.

There are two factors which fundamentally influence slippage—one is the resistance to slip exerted between the two surfaces which are in contact, and commonly referred to as the co-efficient of friction, and the other is the pull in the belt which is the cause of the tendency to slip. Therefore, when a belt slips on a pulley, assuming that the belt is pliable and conforms readily to the face of the pulley, it may be either because the co-efficient of friction between the belt and the pulley is too low, or because the belt pull is too great.

In probably nine hundred and ninety-nine cases out of a thousand, it is because the belt pull is too great, and manifestly the logical and rational thing to do is to decrease the belt pull, not only because it constitutes the removal of the cause of the trouble, but because it decreases the wear on the belt and decreases the friction in the bearings, and as a consequence reduces the demand on the coal pile and the drain on the money box, while increasing the co-efficient of friction accomplishes none of these advantages.

The amount of power a belt transmits is calculated by multiplying the belt pull by the belt speed, so it will be seen that if the belt speed is increased the belt pull can be decreased, and the same power will result. For instance: If the belt pull is 800 lbs. and the speed 3,000 ft. per minute, the same amount of power is being transmitted as if the pull were 600 lbs. and the speed 4,000 ft. per minute, and when you stop to figure that in the transmission of power there is a tension in the belt on both the pulling and slack side when the drive is standing still, which throws a side pull on the bearings of pretty close to twice the working pull, it will be seen that cutting down the belt pull means a great deal.

In this particular illustration the total reduction in the side pull on the bearings is something like 600 lbs., while the pull tending to cause slip on the pulleys is cut down by 200 lbs., and it is all accomplished by increasing the diameters of the pulleys. The real cure for belt slippage and at the same time a profitable dividend paying investment is:

1st. See that the belts are pliable so that they conform to the faces of the pulleys, and then

2nd. Increase the pulley diameters so that efficient belt speeds are obtained, and the belt strains are brought down to within reasonable limits.

IMPROVING THE RAILWAY COUPLING

Very few among the ordinary travelers on railways realize how much their safety depends upon the piece of iron or steel which joins the carriages together. This item has become more important during late years owing to the increased weight of trains, and accordingly railway engineers in Great Britain have devoted special attention to devising an improved form of coupling which can be relied upon under the most severe conditions. Originally iron was the material generally used; and when stronger couplings were called for, the iron was made thicker. Latterly, however, steel has taken the place of iron, and an effort was made to utilize a special nickel-chrome steel, which is enormously strong. This material has, however, the disadvantage of tending to be somewhat brittle, and it is well known that constant vibration increases any tendency to brittleness. To meet this situation one of the leading British firms has applied a special form of nickel chrome steel which, while of great tensile strength, is quite free from brittleness. Railway couplings made from this material have recently been subjected to tests and show remarkably fine results. Whereas a coupling of the old type would stand a pull up to about 50 tons, one of the new couplings of a smaller diameter will easily stand over 110 tons.

Construction work on the new city hall building at Kitchener, Ont., will be in the hands of P. H. Secord & Sons Construction Co., of Brantford. The estimated cost of the structure will be about $253,000.

News From the Welding Field

Safe Practice in Handling Acetylene Generators

Best Housing Methods Under Different Conditions—Fire Hazard Requires Special Attention—Natural and Artificial Lighting of Buildings—Pressure in Pipe Line Important

IT IS ALWAYS desirable to have two workmen trained to properly operate the acetylene generator. If you only have one man in your employ who knows how to operate the generator and he should be sick or absent from other cause, you are liable to permit a man who knows absolutely nothing about the operation of the generator to attend to it, and possibly with serious results, and the chances are that your foreman or even you, yourself, have not enough knowledge about the generator to tell an unskilled man how to operate it or to judge whether he is operating it properly.

Recharging Generators

In the recharging of acetylene generators it is most important to follow the orders and instructions for consecutive operations as laid down by the manufacturer. Manufacturers of acetylene generators have endeavored, as far as seems humanly possible, to make their generators fool-proof, but the idea has never been quite accomplished. It is most important to remember when an acetylene generator is recharging that the generating chamber which contains the water and spent carbide is first of all drained or flushed out and again filled with water before any attempt is made to open or fill the hopper or container with carbide.

Supposing you have drained all the water from the generating or water chamber and that you then before refilling it with water, fill your carbide hopper, there is just the possibility that a piece of carbide may drop down through the feeding mechanism into the empty generating chamber. You must remember that the bottom of this generating chamber will probably have a coating of moist lime sludge. The moisture will attack the carbide and start to decompose. There is, however, not sufficient water to cause the decomposition to take place rapidly and, as a result, the decomposing carbide may heat up and reach a temperature where it is possible for it to ignite a mixture of acetylene and air. Remember if the carbide hopper were opened up before the generating chamber was filled with water, it would be possible for some air to have got into it.

Special attention should always be given to making sure that the hydraulic seals and backflash devices at the discharge of the generator are properly filled with water and are in proper working order. The pressure relief valves, which are commonly employed on what is known as the medium pressure type of generator, should be tested periodically in order to see that they are working freely and release at the proper pressure.

If any repairs have to be made to an acetylene generator, the whole machine should be thoroughly flooded with water to make sure that all gas has been expelled. This may seem very elementary advice, but history seems to warrant it being given as often as possible, and notwithstanding the fact that this advice is given on every possible occasion, workmen will sometimes occasionally open up an acetylene generator to make some minor repair or adjustment and then, without making sure that all gas has been expelled, start to use some metal tool and create the spark necessary to cause trouble.

In these cases where the shops are piped for oxygen supply and the oxygen is supplied from a number of cylinders manifolded together, it will probably be arranged for the same man who looks after your acetylene generator to look after the oxygen manifold and replace the exhausted cylinders with full ones when necessary. It is essential that the workman looking after this work be very carefully instructed in the matter of handling the cylinders with his hands free of grease or oil. When the empty cylinders are disconnected from the manifold and put on one side, the full ones that are to be attached should all have their valves cracked, that is to say, they should be opened very slightly for a moment to blow out any dirt or foreign matter that may have accumulated in the valve orifices during transport or storage. The cylinders should then be connected up in turn through flexible connections to the manifold and the valve on one cylinder opened up, care being taken to open the valve slowly so as not to throw a pressure of 2,000 pounds suddenly on the system. With the valve of one cylinder opened up, the manifold and all connections will contain oxygen at 2,000 pounds per sq. in.

Search for Leaks

A careful search should then be made

The cutting operator working on the outside of the casting cannot see the line of cut. The man in the picture is his helper and is guiding the cut with signals.

As recommended by the National Safety Council.

for leaks, which will be detected by a hissing sound. Connections where leaks occur should be tightened up immediately. After the operator has made sure there are no leaks in the manifolding system, the rest of the cylinders connected to the manifold can be opened up. It should be appreciated that it is necessary to open the valves on oxygen cylinders fully. If any cylinders are found that leak around the valve stem they should be disconnected and returned to the manufacturer.

Under no circumstances whatever should workmen be permitted to attempt to make any repair to the valves and valve fittings on an oxygen cylinder. All oxygen cylinders are fitted with valves having right-handed connections. Unfortunately, certain combustible gases are stored in cylinders of similar size and appearance to oxygen cylinders. Such cylinders should, in the cause of safety, be equipped with left-handed valves, but there are no laws which make it possible to enforce such a safety measure, and I regret to say that there have been one or two isolated instances where a cylinder of combustible gas has been connected up to an oxygen manifold along with oxygen cylinders and with, of course, disastrous results.

These occasions, however, have been so very rare that there is really nothing much to worry about, and even if every combustible gas cylinder were equipped with left-handed valves we would still have the man who might occasionally, by some means or other, connect a right-hand connection to a left-hand connector. As a matter of fact, cases are known where an operator endeavored to connect up a connection from an oxygen manifold to a cylinder of combustible gas, and he found he was unable to make a proper connection because the thread on the valve of the combustible gas cylinder was left-handed. This, however, did not thwart the determined worker and he went into the machine shop and got them to make up an adaptor for him so that he could make the connection. Now when instances of this sort do occur it is very clear that the workman delegated to look after cylinders, generators, etc., has not been properly instructed and cautioned.

Operation of Welding Units

It is quite needless to talk about the operation of the actual welding units, that is, the blowpipe, gas regulators, hose, and the installations using individual oxygen and acetylene cylinders where they are employed. Every manufacturer of apparatus puts out detailed instructions on how the various items of equipment are to be connected up and operated, and if users would follow these instructions, few, if any, accidents would occur. If, for some reason or other, oxygen or acetylene regulators which are employed for adjusting the pressure of the gas for delivery to the blowpipe become disarranged, do not permit your workmen to attempt to repair these themselves. Large establishments can, of course, have a department where welding equipment can be periodically overhauled, repaired and tested, and can employ in that department a man who is properly and thoroughly skilled in his work; but in the case of smaller establishments, it is advisable for defective apparatus to be returned to its manufacturer when overhaul or repair is necessary.

Testing Working Pressure

It is very important to periodically test the working pressure gauges on the regulators. These are the pressure gauges that indicate the delivery pressure of the gas from the regulator. As previously mentioned, acetylene should never be used in a blowpipe, or in a hose or piping system at pressure over 15 pounds per sq. in., and it is on this account that we emphasize the importance of making sure that the working pressure gauges, particularly those on the acetylene supply, are periodically tested to see that they register correctly. You hear occasionally of accidents where the hose supplying the gas to the blowpipes has burst. In nearly every case this can be traced down to the fact that acetylene was being supplied to the hose at a pressure in excess of 15 pounds per sq. in., either intentionally or because the working pressure gauge on the regulator did not record properly, with the result that a backfire in the blowpipe propagated through the blowpipe to the hose. Now appreciate that the backfire would not matter at all if the pressure in the hose was not above 15 pounds per sq. in. The acetylene would not even burn. But when the pressure is over 15 pounds to the sq. in. the acetylene may readily decompose and cause the hose to be ruptured, and probably disarrange the functioning of the regulator attached to the gas cylinder.

Proportions of Hose

Guard against using long lengths of hose of too small a diameter. Quite a number of blowpipes only function properly when the acetylene is delivered to the inlet to the blowpipe at pressure somewhere between 10 and 12 pounds to the sq. in. Therefore care must be taken to see that the diameter of the hose is large enough in proportion to the length to be employed to insure that the drop in pressure between the outlet of the regulator and the inlet of the blowpipe is not more than a pound or so.

It is probably advisable to say a few words about the acetylene cylinders. Some of you may not appreciate the fact that an acetylene cylinder is not merely an empty shell containing compressed gas the same as an oxygen cylinder. The interior of an acetylene cylinder is completely filled with a porous material such as asbestos, or a concrete made up of charcoal instead of crushed stone. This porous mass has a porosity of about 75 to 80%, and is being employed for the following reason:

It is found that if acetylene is compressed into a porous substance, and where the porosity does not exceed 80%, and acetylene cannot be exploded or ignition propagated when the pressure is over 15 pounds per square inch, as it could be if the cylinder contained no porous mass. Therefore, a cylinder properly constructed and containing the proper porous mass can be safely used for the storage of acetylene at over 15 pounds pressure per square inch. Cylinders commercially used today, in addition to containing the porous mass, also have in them a solvent, which will dissolve many times its own volume in acetylene, thus making it possible to store in the cylinders large quantities of gas at comparatively low pressure. A charged cylinder of compressed acetylene contains practically no free gas. All the gas that is in the cylinder is in solution in the liquid solvent, which liquid solvent is in turn absorbed in the porous mass in the same manner that a sponge absorbs water. When the valve of the cylinder is opened and pressure released, the acetylene gas comes off from the solvent in the same manner that CO_2 bubbles up through the water in a seltzer water syphon when the valve is opened. Acetylene cylinders should always be stored and used standing upright.

Safety Fusible Plugs

As mentioned previously, the safety devices in acetylene cylinders consist of fusible plugs which melt at a temperature of 212° F. It will therefore be seen that care must be taken not to let any flame come in contact with the fusible plugs. Otherwise they will melt instantly and release the full charge of gas in the cylinder.

Make a point of insisting that all welding operators wear suitable goggles. When securing suitable goggles it is advisable to have them comply with the specifications for goggles of the National Head, Eye and Ear Code for acetylene workers. Welders employed on heavy work should be supplied with fireproof gauntlets and aprons as a protection against radiated heat, and it is considered advisable where welding is being performed in the interior of some structures to insist that all outer clothing be fireproof.

Get The Safety Habit

It is sincerely hoped that some of the recommendations may help to steer you clear of accidents which need not occur, but don't forget that safety practice does not end with proper operation of your welding equipment. Welding must only be used for work where welding can be considered good and safe practice for construction or repair. Some users become over-enthusiastic and attempt to employ welding on certain work where it should never be attempted and consequently fall down badly, with the result that it tends to give welding a

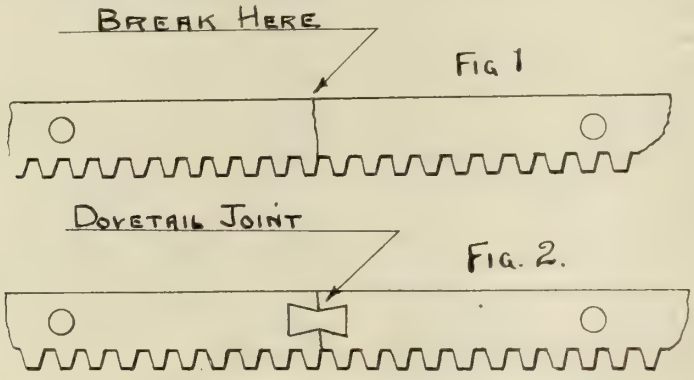
Practical Ideas From Practical Men

"REPAIRING A BROKEN RACK"

By G. Blake

This was a small mild steel rack, which had broken as shown in Fig. 1. As it was not possible to cut another, the writer repaired the broken one as shown in Fig. 2. Two dovetail slots were cut, one in each of the broken ends, and a dovetail wedge piece was snugly fitted. The slots were given a slight taper or bevel so that when the rack was brazed the molten metal would flow into the bevelled slots and make a solid joint. Regarding the brazing, it may be mentioned that to ensure the rack being straight, and to prevent any warping it was supported on a cast iron slab on two thin parallels near to the joint and held in that position by two small clamps during the brazing operation. This repair turned out entirely successful, and much time was thereby saved by repairing the broken rack, as to get another from the makers would have taken nearly a week.



Repairs to Machine Rack.

SQUEEZE LIGHTLY ON MACHINE VISES

By D. A. H.

Flat vises are used in vast numbers on milling machines and, to some extent, other tools. And besides these, there are many special fixtures used in manufacturing that follow the same gripping principle built into a design that adapts itself to high production on a particular job. Mechanics often complain at the short handled wrenches that come with these vises; they do more than complain—unless a foreman is right on the job—they hammer the handles unmercifully in gripping a piece of work or they substitute an ordinary wrench reinforced by a length of pipe. "They are going to get the vise tight—that's what."

But do they hold the work tighter by such heroic measures? Vises are built with parallel jaws, which will remain so for long years if not abused and if an hour or two is spent in that time in adjusting gibs for natural wear in the slides. With reasonable pressure on the screw, vise jaws will remain parallel, on any vise that is kept in good physical condition.

Work pieces must be held in the top half of the vise (for the bottom half is the base or "backbone" of the vise) and frequently they are thin pieces that catch the jaws only on their top half. Consequently, the result of gripping is to spring the vise if pressure enough is applied to the handle; the body of the vise usually has the same depth vertically as the jaws and that depth is not sufficient to render the vise proof against all kinds of stresses. In practice, the ignorant workman bends the body of the vise when he puts too much pressure on the handle.

As the vise is ordinarily clamped at the two ends, the centre springs up when so much pressure is applied and this defeats the very end the workman sought to attain, that of holding the work tighter. In bending up, the jaws bend also with the top edges spreading apart—this done the work is gripped only near the bottom. The result is a far poorer grip than one when but half the pressure is applied to the handle. A vise with non-parallel jaws never holds.

An instance of vise abuse and intelligent correction will be told. A new foreman in the milling machine department had set up a machine for cutting off six bars at a time of ¼in. x ½in. cold drawn steel. These were placed in an ordinary vise having an end stop arranged and with a parallel under the bars. The foreman ran two loads through, telling the operator to watch how he did it and giving other verbal instructions. Then he went about other work, leaving the operator alone as he had done similar work before.

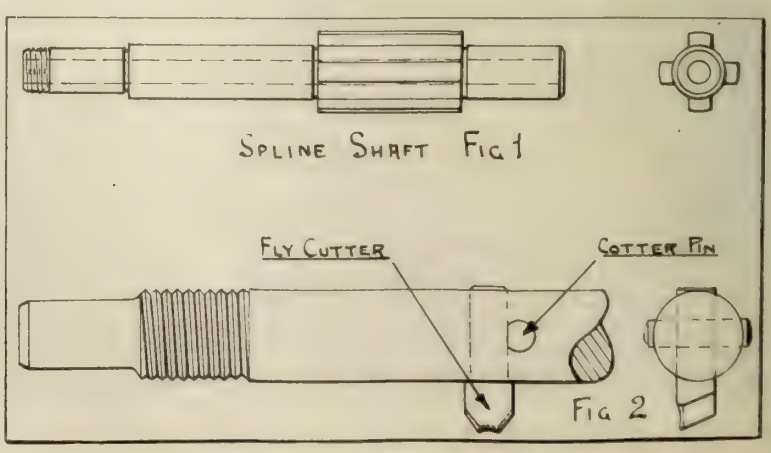
Fifteen minutes later, the operator hunted up the foreman to tell that "the vise had broken." Investigation showed that as soon as the foreman had gone, the workman had dug up a piece of pipe and slipped over the vise handle "so he could hold the bars tight" but "that wasn't what broke the vise because they always used the pipe."

The new foreman had been brought up in a school that taught one to reason things out. He showed the man how too much pressure actually lessened the grip and why he had gotten along so nicely on the first two cuts with only normal pressure on the short wrench. A new vise was obtained and the subdued workman proved for himself that it was not necessary to abuse it in order to make it do its proper work.

MAKING A SMALL SPLINE SHAFT

By G. B.

In the small shop one is often faced with the problem of making the small order pay, particularly so in the case where special tools have to be made and the cost of the same to be spread over a comparatively small quantity. We experienced something of this when making 50 of the spline shafts as shown in Fig. 1. We had no formed spline milling cutter and the method of taking three cuts with an ordinary milling cutter did not appeal to the writer as, after the



Milling machine arbor with fly cutter.

milling, it would have been necessary to trim up the radius with a file. A fly cutter was made and fixed in the milling machine arbor as shown in Fig. 2; this cutter was first turned on the shank then filed up to suit the profile of the sample spline shaft, it was next backed off by hand, hardened and touched up on the grinder. A hole was drilled in the milling machine arbor so that the shank of the cutter fitted snugly. The cutter, it will be noted, was held in position with a steel cotter pin. The milling of the spline was performed in the usual way, holding the shaft between centres on the dividing head. By taking a fairly light feed the splines were cut as accurately as if they had been done with the usual formed circular cutter.

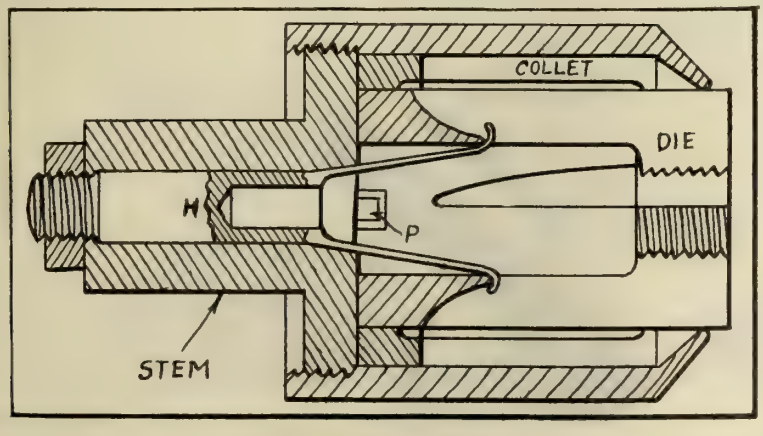
IMPROVEMENT FOR COLLET DIE

By D. A. H.

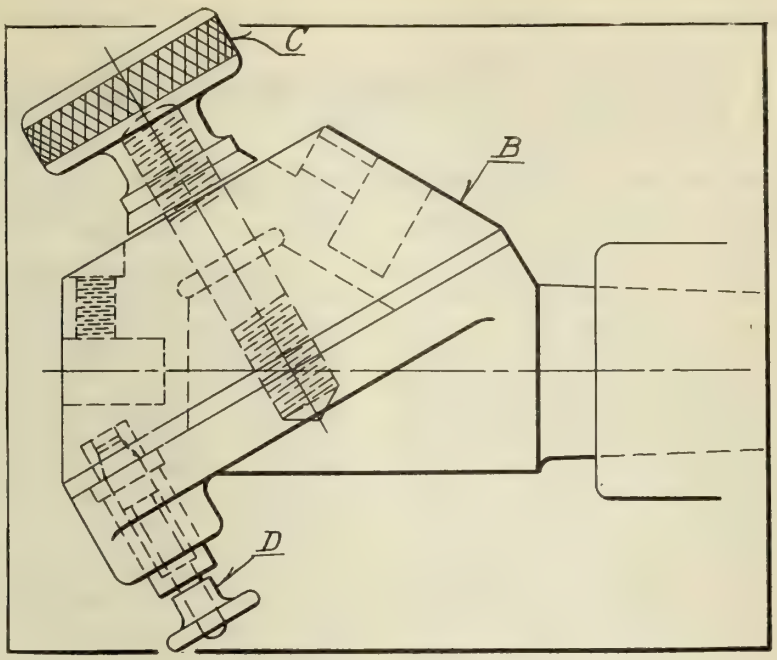
On small work, the round die known variously as a button, acorn, spring, or collet die, has come to be the tool most widely used on automatics. It is low in cost and it possesses an adjustable feature that permits of a limited range of fits to be made with it. Of these, the spring die that is made to go in a collet style of holder is undoubtedly the best. This holder closes equally on all prongs of the die, causing them to cut equally and keeping the die centred with the work spindle.

Driving pins in the holder (P in the drawing) relieve the outside shell from the thrust of the cut. But when it is desired to cut a thread of the larger size, the collet must be opened up sufficiently to allow the prongs to spring out their limit; there is not much grip on the die then and they keep pulling out of the holder as they are backed off the screw. This has led to some condemnation of this type of holder.

The drawing shows a way of avoiding this trouble when the screws are of a length that does not pass through the shank. The shank is enlarged and through it is placed a piece of steel H which has a thin nut on its inner end bearing against the shank. The outer end of this piece was drilled, then filed through leaving two fingers which could be spread apart and bent. The hook-shaped ends of the two fingers engage the slots, or flutes in the die and effectually prevent the die's pulling out as it backs off.



Improvements to collet die.



Small turret for engine lathe.

MACHINING SMALL LOTS

By J. H. D.

In almost every machine shop there is always some unfortunate soul picked out to do the thousand and one details in the way of small turned pieces. There are numerous parts to be machined in lots of a dozen or so which makes it a tantalizing proposition from the standpoint of production at low cost. Herewith is a drawing of a miniature turret to be used in conjunction with the engine lathe. It is made with a taper shank to fit the tail stock spindle; in all other details it resembles a regular turret. The revolving part B is inclined at an angle of thirty degrees and is locked in position by the knurled nut C. This turret can be made with four or six stations. The spring plunger D locks the turret in its position. Tools are held in place by Allan headless set screws. Holders for the different tools such as drills, hollow drills, hollow mills, taps and so forth can be made up for use with this attachment. Where ever much work of a duplicate nature is done on a small scale, it will pay to provide such a tool for the shop.

USE RECORDS

Records that are never used are worse than useless. The time and the effort required to keep them has been wasted. Using records spells progress. Failing to use them means falling short of the greatest ultimate success. Records are guidebooks to future action. Their use makes it possible to escape pitfalls, to prevent waste, to avoid mistakes.

CATALOGUES

Canadian Ingersoll-Rand Company, Montreal, with factories at Sherbrooke, Que., have just published a new catalogue K-602-A, illustrating and describing "Circo" direct vertical lift air hoists, the development of which has been carried to such a point that they might be called reciprocating air hoists. They are now built in their entirety at the Sherbrooke works and stocked in all standard sizes. The catalogue shows the different usefulnesses to which the hoists can be put, not the least of which is the foundry, where some concerns supply each molder with one for lifting copes, drawing patterns, etc. One of their chief uses is in connection with the molding machine floor. Further description of the hoist is unnecessary, since it is fully described in the catalogue, which can be had for the asking.

Duraloy can be welded by either the oxy-acetylene or electric arc methods, although it cannot be hammer welded. Preheating is found advantageous, particularly in the case of castings. Since the metal does not oxidize, it cannot well be cut by the oxy-acetylene cutting torch.

New Things in Shop Equipment

GASOLINE INDUSTRIAL TRACTOR

A gasoline driven industrial tractor intended for general use in machine shops and engineering works has been placed on the market recently. A notable feature of the machine is the small turning radius which may be as small as 5 ft. 3 in. Wheels are of the cast steel disc type fitted with Timkin bearings. Rear driving wheels are 22 x 3½ in. and the front steering wheels 16 x 3½ in., all tires of solid rubber. Power is supplied by a four-cylinder, four-cycle motor, rated at 23 b.h.p. at 2,000 r.p.m. The battery is mounted under the truck. The 6-gal. gasoline supply tank is located in front of the driver and fuel feeds by gravity. Fabric universal joints are fitted between the transmission and the rear axle, which is of the internal-gear type, full-floating and operating on Timkin bearings at a speed reduction of 8 to 1. Internal-expanding brakes are fitted on the rear wheels. Machine may be operated at a speed of from one to eight miles per hour. Special bumper is provided at front and rear. Machine has a length of 72 in., width of 40 in., and weighs about 2,900 lbs. It is made by the Toromotor Co., Cleveland, Ohio.

CUTTING-OFF MACHINE

Improvements in the design of the "Modern" cutting-off machine have been announced. The chief changes are in the method of handling the stock and the location of the operating levers. The larger machines are now equipped with double live roller feed for feeding the stock through the spindle. The automatic stop, for gauging length of stock, is operated from the tool block. The arrangement is so designed that the tool-block moves out to clear the tool after the cut. This movement brings the stock stop in a position for gauging the length of the next piece. The stop is pulled back by means of a spring, so that it is not in contact with the work during the cutting-off process. The speed of the roller feed is automatically regulated by the speed of the machine. Feed rolls run continuously but are only in contact with the stock when the collet is open, the lever that operates the latter being also connected to the roll feed mechanism. The convenient location of the two operating levers, the left-hand one for controlling the collet and feed, and the right-hand one for moving tool block and gauge stop, facilitates production and relieves the operator of considerable effort. These machines are made by the Modern Machine Tool Co., Jackson, Mich.

BOX RAILS AND STEEL STRINGERS

What is designated as box rails and stringers, made in the form of rolled steel sections, especially designed to facilitate the erection of lineshafting and similar equipment, has recently been developed and placed on the market. The box rails are a kind of continuous socket insert, the cross-sectional area being generally greater to give added strength. They are primarily intended to be built into the concrete ceilings at time of construction. The surface slot permits of inserting the head of a bolt at any point, which is anchored by giving it a quarter turn. This system of anchorage may be adapted for a wide variety of uses, such as monorail conveyors, on the side walls for supporting brackets for crane rails, and in floors for securing machinery, etc. Motors may be hung on these stringers so that adjustment along the length of slot provides facilities for taking up slack of belt. These box rails may be secured in any length. The feature of the system is claimed to be its flexibility, as adjustment of substringers may be made to any desired position. This equipment is manufactured by the Midwest Steel and Supply Co., New York.

TOOLHOLDER WITH INTERCHANGEABLE CUTTERS

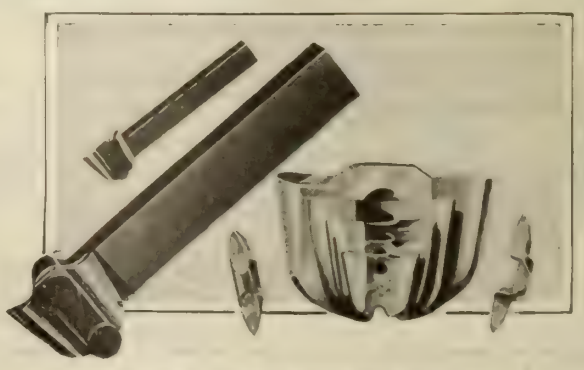
A toolholder with interchangeable cutters of various shapes that can be adapted to any class of work where toolholders may be used, has just been placed on the market. The holders are made of chrome-nickel steel and have two projecting portions at the cutter end in which the clamping bolts are inserted. The holes are offset unequally from the centre of the shank and the height of the tool cutting edge may be altered by changing the blade to the other side. The special feature is the construction of the high-speed steel blades, as each blade has two cutting edges and can be turned to use either one of them. The cutter has exceptional depth which gives added strength to the tool. The various shapes provide for turning, cutting-off, threading and facing and their construction is such that any one can be used in the same holder. Side and front rake are always the same as these are formed in the making of the cutter. Sharpening is accomplished by grinding the top slope. It is claimed that the design provides for very heavy cutting and that the rigidity is similar to a solid forged tool. The tool can be used on any machine where toolholders are in service. Twelve sizes ranging from blades of ⅛ to 1⅛ in. in thickness are made. These toolholders are manufactured by the Morris Tool Co., New York.

"SPEED-UP" GARAGE TOOLS

A number of time-saving devices for service about the garage in the repairing of automotive engines have been offered to the trade recently. These include a reseating tool by which valves of all 45-deg. removable head motors can be reseated regardless of their size. Work on different sizes of values can be carried on without any change of pilots. The pilot is made in one piece with four steps of sizes to suit stems of 5/16, ⅜, 7/16 and ½ in. dia. A snug fit of pilot is assured by a slight taper on each step. The pilot telescopes into the handle and is forced outward by means of a coil spring. The two diameters of the 45-deg. cutter are 1⅛ and 3 in.

Another serviceable device for the garage is a special vise for holding pistons, ball bearings, universal joints, etc. The jaws provide four points of contact for holding the work, the gripping surfaces being lined with lead. The fixed jaw is bolted to the base while the movable jaw slides along a smooth surface by means of a screw and hand wheel. The vise has a capacity for work up to 5 in. in dia., with an overall length of 10½ in.

Still another device is a sleeve for fit-



Tool-holder with high-speed steel cutters.

ting rings to pistons without injury to the latter. The sleeves can also be used when slipping assembled pistons into the cylinder block. The device keeps the rings compressed and the ring joints properly spaced. The sleeve is split and made of tempered steel in five sizes ranging from 2⅝ to 5⅛ in. in dia. These several devices are manufactured by Stevens and Co., 375 Broadway, New York.

UNIVERSAL SAW BENCH

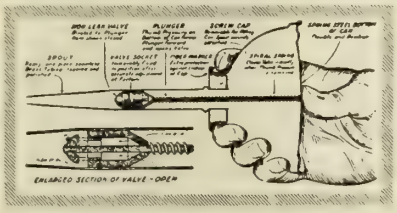
A fully universal bevel and miter saw bench fitted with tilting arbor and sliding table, and which may be quickly adjusted for performing different classes of work, has been placed on the market recently. The wheel spindle may be raised or lowered vertically by means of a wheel at the front of machine; this feature is especially serviceable for grooving and rabbeting. Saw spindle can be tilted to an angle of 45 deg. Frame is lightly but rigidly constructed, allowing ready access to all parts of the mechanism. Left-hand portion of table is movable sideways and adjustable to saw position. It can be swung back out of the way if desired. The right-hand section of table operates on rolls fitted to the track, and may be adjusted sideways to permit of using a dado head in place of the saw. Saw arbor yoke is carried in a circular groove, and saw may be raised or lowered when adjusted to an angular position. End thrust of saw arbor is taken on ball thrust bearings. Ball bearings may be provided on the spindle in place of the babbitt usually employed. Machine has a capacity of sawing material 6½ in. thick, when using maximum diameter of 18 in. saw. Saw arbor operates at a speed of 3,600 r.p.m., with countershaft running at 1 200 r.p.m. Machine is fitted with all necessary work gauges. A floor space 72 x 58 in. is required. Belt-driven and motor machines have a net weight of 1,100 lbs. and 1,350 lbs respectively. They are made by the Hooker Manufacturing Corp., St. Johnsbury, Vt.

DRAW-CUT HACK SAW

A portable motor-driven draw-cut hacksawing machine, with a capacity for work 6 in. by 6 in. on long stroke, and 8 in. by 8 in. on short stroke, has been placed on the market recently. The motor is located at the rear of the machine and the drive to the crankshaft is by means of a silent chain. The drive gears operate in oil and are entirely enclosed. Provision is made for connection to a convenient lighting socket wherever the machine may be placed. The feature of the machine is the self-contained drive, which makes it particularly valuable in structural steel and ornamental iron works, as it may be moved to any desired position with very little trouble. The starting and stopping of the machine is similar to the belt-driven type, the movement of a handle controlling the operation of the electric switch. No clutch is used. The saw frame automatically trips the lever when a cut is completed. The floor space required is 52 by 18 in. Machine weighs about 350 lbs. It is made by the Armstrong-Blum Manufacturing Co., Chicago, Ill.

NON-LEAK OIL CAN

An oil can that is constructed to prevent the dripping of oil from the spout except when pressure is applied to the spring bottom has recently been placed on the market. The valve socket is located in the spout of the can and rigidly fixed in a definite position after accurate adjustment at the factory. The valve



O-No-Drip Oil Can.

that regulates the flow of oil from the can is riveted to the plunger that extends from the valve to the spring bottom of the can. Pressure on the can bottom forces the plunger outwards and opens the valve in the spout. A small spiral spring surrounding the plunger causes the valve to close instantly when thumb pressure is removed. The spout is drawn from the best quality brass and will not bend, turn or split. The can is made of rolled steel, copperized inside and out. The screw cap is particularly large and a fibre washer provides extra protection against leakage. All cans are tested at 110 lbs. air pressure. They are known as the "O-NO-DRIP" and are made by Arthur S. Harding Co., Boston, Mass.

ALUMINUM LINE LEVEL

An extremely light level made of aluminum and weighing only ½ oz., eliminating any appreciable sag when used on a line, has just been placed on the market by the L. S. Starrett Co., Athol, Mass. It is 3 in. in length and made from ⅜-in. hexagon stock so that it may be used effectively as a surface level. It may be conveniently carried in the pocket. A luminous level glass with a yellowish fluid is used for the vial. The slots on the protruding pieces are carefully constructed so that the part of the slot which comes in contact with the line

Aluminum line bevel.

is true in relation to the level. The design of the slots prevents the level from dropping off the line when in use. Carpenters, masons and contractors will find this line level especially useful in laying foundations, tile pipe, cement and brick walls, working ditches, determining grades, building roads, aligning ditches, shafting, machines, etc.

MARINE BOILERS FOR LAND STATIONS

During the war many important advances were made in the design of the boilers fitted to British men-of-war. The exraordinarily severe service demanded from naval boilers stimulated invention in many directions. The reduction since the war in naval programmes of all nations has accordingly restricted the demand for such boilers, and the makers are turning their attention to other fields. They have found a very promising one in the electric pump station. The marine type of boiler has the advantage of taking up comparatively little space and of being able to give a very rapid increase in steaming power, when, for example, a sudden load comes on the station. In one large British electrical station two of these boilers are being fitted with oil burners, and excellent results are expected to follow.

IMPROVED FORM OF PULLEY

No kind of equipment is more familiar to the engineer than a shaft carrying pulleys; and in most cases it retains a primitive simplicity which makes it adaptable to a wide range of conditions. There are, however, cases where a departure from the traditional form is likely to be advantageous. For example, the development of ball bearings, to which keen attention is being given in Great Britain, is regarded as an important source of economy in running. Another feature is the use of a split pulley where it is necessary to add pulleys to a line of shafting. Quite a new form of split pulley, claiming many advantages, has been introduced by a British firm, and it is so simple in construction that one person can easily mount it on a pulley within a minute. The pulley is made in two parts, one forming more than three-quarters of the circle and carrying two projections against which the other piece is fitted. The adjustment of one screw tightens up the pulley and keeps it in straight alignment. No side-holding screws are employed, so that the pulley can be fitted close up to another pulley. This and its other advantages make it peculiarly well suited for experimental work where pulleys have to be put on and taken off with the least possible interruption of other work.

Charter is being applied for at Ottawa on behalf of the Buffalo and Fort Erie Bridge Co., who propose to build and operate a bridge across the Niagara between Fort Erie and Buffalo.

Present Ills and the Remedy

IN THE numerous annual reports and reviews that are being issued at the present time, it is interesting to note the various diagnosis of present industrial ailments, and the remedies that are proposed.

A machine tool manufacturer observes that the "only means of overcoming the high cost of production, and the only way to attract capital is to secure and to show improved methods of production in factories now established." A manufacturer of a commodity extensively used in building and engineering operations, remarks that "Canada is primarily an agricultural country, and as long as this basic industry is carried on in a way that does not give a fair return to the farmer for his efforts, there cannot be any great measure of prosperity in this country." Another observer refers to difficulties "where the local market is only a fraction of that necessary to consume the supply."

These statements having established the fact that Canada has production capacity but serious market limitation, there is great significance in the conclusion of a financier noted for his practical, common sense in matters pertaining to industrial economics. It is that there is urgent need at the present time for high standard immigration, the building up of the population and the necessity for broad national emphasis upon the importance of thrift, industry and independence. So long as production is confined to restricted markets, costs will be high. Only in the development of volume operations and of the means of easy and profitable absorption can there emerge a solution of the difficulties referred to.

Economists See Buying Wave

THAT A BUYING wave is gathering force, and that the inspiration of mounting prices is taking possession of the business world, is the observation of economic investigations in the United States. Trade reviews are roseate. Signs point to higher prices. It is claimed that when the buying community realizes this the buying wave is bound to start; in fact, it is said to have already started.

There is another side. What is described as "our great senseless, useless over-supply of gold is increasing the cost of living inevitably." It is responsible for high temporary peaks in business, and in time, for descent to low, uncomfortable valleys. Economists do not all seem to see an unmixed blessing in the development of internal trade at the expense of trade with other nations, many of whom are heavy debtors, unable to pay except in goods against which there is a tariff barrier. They feel their country is in the same position as the millionaire referred to by the California banker who claimed he would rather have 30 cents and feel like a millionaire, than be a millionaire and feel like thirty cents.

Further, while business in the Eastern States is having wonderful records, there are internal sore spots and famished areas. Though crops have been good, farmers are said to be dissatisfied with returns and in some sections there are decreased acreages. Farmers have gone to work in factories. Wages in many lines are such that a scarcity of common labor has developed. It is claimed to be proving unwise to fix, by law, wages, rates, prices, etc., that should be allowed to take a natural course. A wave of radicalism is feared by some.

Meanwhile, Canada occupies the position of innocent bystander. There has not been the same sensational industrial recovery here, nor the same basic economic condition. Proximity, however, will exert certain influences. The steel industry will be the first to reflect the tendency, but restricted market may curtail widespread results. Most serious of all will be the effect upon available labor. Shortage in United States has always had the effect of serious inroads upon Canadian forces. The high wage becomes an imperative proposition. These are times when industry must have courage. When influences from without have to be solved as best they may, in relation to conditions within. Steady, well-established industrial growth, such as is apparent, is not easily unseated.

To Study Export Trade

SHORT COURSES in export trade are to open Jan. 15th in Toronto University, and Jan. 29th in McGill University, Montreal, in co-operation with the Department of Trade and Commerce, Ottawa. The courses will consider the principles of international trade, economic geography, transportation, trade currents and cycles. There will be discussions and demonstrations on special trade topics.

The course is calculated to better equip all those interested in shipping to size up commercial conditions and prospects in different countries. It will portray the many sides of international trading, and will enable students to apply increased knowledge and understanding to the work.

Canada has ambitions as an exporting nation. This course seems appropriately timed, for there is a feeling that the period is approaching when expansion in world trade will develop unusual opportunities. It is well that manufacturers should be schooled in the sound principles of this phase of business. It is an important step and no doubt many firms will be represented in the enrollment. Through their co-operation the courses will be successful.

Dollar Advance in Pig Finds Strong Market

Foundries Covering for First Quarter as Coal Strike Looms—Radiator Plants Taking Good Tonnages—Pittsburgh Reports Many Additional Blast Furnaces Being Blown In—Inventory Season

MACHINE TOOL MEN REPORT BETTER SALES

THAT THE steel industry is running largely on the momentum acquired not so much from fresh buying as from the volume of old orders that accumulated and have to be filled, is a statement made by an observer, writing from Pittsburgh. Predictions made six weeks ago that there would be a decided falling off in production in December will have to set their dates still farther ahead into January. Many new blast furnaces are being blown in. Business men, including bankers, are of the opinion that trade activity will keep up for several months in the new year. The steel trade, unless a coal strike upsets all calculations, may be expected to move in harmony with the general condition.

Pig iron markets are developing strength. Larger buyers are now covering for the entire first quarter. Pittsburgh reports that the valley basis was $25 a ton, but, as the buying progressed, the price moved up to $26 and this was firmly held. It is stated that foundry iron may easily go above that price by the end of the year.

After a series of declines, the Toronto pig iron market staged an advance of $1 a ton to $31.80, effective December 20. There is greater activity in the market than for some time. Foundries are better employed and, with prices where they are, practically $1.50 a ton lower than Buffalo, are covering in good quantities for first quarter requirements. Algoma Steel Corporation report that they are selling some iron to foundries in Northern Michigan at points where shipment may be received from the Soo at advantage. Radiator plants and other concerns in contact with the building industry are taking large quantities. On the whole there is a feeling in evidence that, at present prices and with prospect of labor troubles, pig iron is an attractive buy. Steel Co. of Canada may blow in their second furnace before the year ends.

Machine tool dealers report that during the past three months they have had some pretty fair bookings although, on the whole, the year will not show improvement over last year. Canadian National Railways have issued another list of tools on which they are asking for tenders, returnable Dec. 28.

Toronto

December 20.

IT IS THE inventory season, and manufacturers and dealers are estimating in terms of dollars and cents the results of the year's business. In many respects the finish has been good and it is felt that, as far as the material is concerned, the coming year should see marked improvement. Some reports will show a gain over last year, but on the whole there is consolation in the fact that results were developed wherever there was aggressive sales organization. In machine trades the past three months have seen some satisfactory business.

Railroads have made some purchases, and there is at present a list out for a considerable quantity of equipment for the Canadian National Railways. This list includes woodworking machinery, wheel lathe, electric welding outfits, lathes, bolt-turning machine, and considerable miscellaneous machinery. Tenders are returnable Dec. 28. In addition to this, the National is placing orders for large quantities of track and rolling stock requirements to cover their visible needs for the coming year. This will mean more normal operations in many plants that have had machinery lying idle.

The prospects are said to be bright for the early operation of the Algoma Steel Corporation on a much larger scale than for the past six months, in which little more has been done than to take care of pig iron requirements by the use of one furnace. The Steel Company of Canada will also begin the new year with their second furnace available for foundry pig iron.

Iron and Steel.—An easing off that is characteristic of the year end has set in, and the market is without notable feature. Some business is being booked for first-quarter delivery at prevailing warehouse prices which, it is claimed, do not fully reflect conditions at the base of supply. It is pointed out that with bars at $2 in Pittsburgh there should be added about $1.65 to make a reasonably profitable Toronto price, but the dealers are still quoting $3.25 to $3.40. Blue annealed sheets, it is pointed out further, while quoted at $4.25, are bringing out some quotations at below $4, a price which, it is claimed, is absolutely out of line with present conditions.

Some dealers are inclined to deplore a lack of confidence among Toronto dealers in the matter of stabilizing prices. There is said to be a lack of cooperation and that Toronto market is always a buyers' market because there seems to be no factor making for steady prices. Buyers interviewed in the matter were not all agreed that by peddling a contract it was always possible to get some firm to undersell. While they admitted that, although it was always possible to get a range of 5 to 15 cents, the market was inclined to be firm at a certain point. Prices ruling on the Toronto market are as follows:

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 75
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		4 25
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 00

Pig Iron.—The week has brought an increase of $1 per ton, to $31.80, in pig iron. There is a much steadier tone in the market and some very good orders have been placed. Taking the trend of the American market into consideration, it would seem that, at $30, the bottom of the decline had been reached. Apprehension as to a coal strike next spring will undoubtedly bring out business as a matter of preparedness. Buffalo reports that pig iron at $26 is in a stronger position than for some time. As an indication of building prospects next spring, it is stated that orders aggregating 150,000 tons have been placed by radiator interests in the past three weeks. Furnace operators are reported as saying that they have no further cause for worry as to a further decline in price. Prospect of an advance early in the new year is said to be not unlikely by Canadian furnace interests. The new price is about $1.50 below Buffalo.

Old Materials.—December has been an exceedingly quiet month in the scrap iron market. Transactions are not showing any volume and reports from American centres also show things to be at a temporary standstill. It is reported that large operators are exceedingly optimistic as to the outlook. Steel mills are steadily increasing their production and it is said that most of them have orders on their books to run at present capacity for some months. While it might be expected that the rise and fall of pig iron would be reflected in the scrap market, it is pointed out that the movement in pig iron was largely the result

of artificial conditions which could not effect pig iron markets very materially. Dealers' average buying prices:

Copper, light	9 00
Copper, crucible	11 25
Copper, heavy	11 00
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton.	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Non-Ferrous Metals. — Business is good but the majority of firms are doing business in a very conservative way, is the report from a large dealer. The railways were not a heavy factor as yet. Their purchases were largely in babbitt metals. Prices are firm. Tin prices in London have fluctuated considerably but it is felt that the rise in sterling may have the effect of forcing prices down somewhat in order to bring buyers into the market. Great activity has developed in copper. The 14-cent level is holding steady and it is stated that consumers in the States took five million pounds last week. Demand is strong and from a lethargic condition copper has moved into the upward-moving list.

Lead remains at fairly stable levels, while zinc is said to be holding fairly well with little notable business moving. Zinc in London showed a decline.

Dealers in the non-ferrous metal markets are in communication with the Customs department looking to some adjustment of sales taxes on ingot metals subject to re-sale. They claim they are losing much business by reason of the fact that large manufacturers may import direct with tax of 3¾%, whereas a dealer importing for re-sale must not only allow for the 3¾% but include an additional 2¼% in his re-sale price. A plan is proposed whereby sales made by manufacturers and wholesalers holding sales tax licenses for re-sale should not be subject to sales tax. In connection with this there is a suggestion that consumers pay 4½%, the idea being to provide some revenue in view of the sales tax that would be lost in case the wholesalers were not assessed.

Prices in Toronto market:

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

Montreal

INVENTORY season dullness has settled upon the market and outside of an advance of $1 in the price of pig iron, there is no outstanding movement. The year closes with a fairly good showing of business.

Pig Iron.—Recent reduction of $2 a ton in the price of pig iron has been followed by an advance of $1, to $34.15. At this the Canadian price is below the level of U. S. competition throughout Ontario, and even in Montreal district the price is now down to a basis where Canadian-made pig iron can successfully compete with imported iron. There has been considerable inquiry, more particularly for special grades, and fairly heavy purchases have been put through, consumers evidently being of the opinion that present prices are about, if not quite, at the bottom and that there may be an upward tendency in the near future. Demand for steel is fair, more especially for bars, wire, wire nails.

Algoma, No. 1, car lots on Tracks, nominal quotation		34 15
Summerlee, 30-ton lots, dock	35 00	....
Carron, 30 ton lots	35 00	....
Do., 5 ton lots, ex. warehouse	40 50	....

Non-Ferrous Metals.—Commenting on the situation in non-ferrous metals, the British Metal Corporation have issued a letter pointing out that in copper a firmer tone has been noticeable, U. S. prices now being quoted 14⅛ to 14¼c. Export business has been on a larger scale and domestic orders for the first quarter of the new year have been freely booked. From the number of foreign enquiries that are being received in the U. S. A. for electrical locomotives it would appear that electrification of railroads is going ahead; how soon the effect of these orders will make itself felt in the copper market it is difficult to say, as the orders, whilst of a varied nature and from many sources are not of great magnitude, lead one to suppose that they are more for experimental purposes. In the meanwhile, it must not be forgotten that production is exceeding consumption, last month's excess amounting to 3,000,000 pounds.

The London electro market closes unchanged, the advance in price on this side being counteracted by the rise in sterling. Considerably more interest has been taken in standard and prices close £1 higher. The turnover of 7,100 tons is the highest since May and consisted almost entirely of future transactions.

In tin, continued upward movement of sterling has been accompanied by heavy fluctuations and made trading in New York very difficult. Indeed the entire decline on the London market has been offset by the appreciation of sterling and New York prices close higher on the week.

Some tin has been sold in U. S. for reshipment to England, dealers taking every advantage of the exchange, and while this should have the effect of depressing the London market, the phase may only be a temporary one, and the greatest gainers the shipping companies, who, in all likelihood, will eventually be called upon to ship the tin back again to this side.

U. S. supplies of lead are freer with a corresponding effect on values. This increase in stocks, combined with a decline in prices, should tend to alleviate the tightness of the European position.

As in lead, though not to the same effect, stocks of zinc are increasing. The market has a weaker tone, but demands for brass goods and galvanized sheets are good and no great recession in prices is looked for. Montreal prices:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	45 00
Lead	8 00
Spelter	9 50
Antimony	7 50
Aluminum	22 00

Pittsburgh

December 20.

OPERATIONS at steel mills reflect various conditions as to order books. Some subsidiaries of the Steel Corporation have reduced operations in the past week or ten days, while others have increased. The Carnegie Steel Company has put on several additional blast furnaces, while the National Tube Company now has the Riverside plant, in the Wheeling district, in practically full operation. Several independents have decreased operations.

Steel ingot production was at a rate of about 40,000,000 tons a year in both October and November, and in the first week or ten days of this month was probably at a rate distinctly above this, but with the decreasing operations already seen at some points and with the curtailments that are likely over the holidays, this month's total output may show a reduction.

There is a heavy pressure for production of wire nails and of merchant steel pipe, while other lines are under no particular pressure.

Operations are being watched for the indication they may furnish as to business conditions next year. Movements just now as to production are not particularly significant, however, on account of the near approach of the annual inventory date. Normally buyers like to have reduced shipments at this time to lighten inventory, even though they may need much more material later. To illustrate, production of ingots last December was 15 per cent. less than the average of October and November and 20 per cent. under the average of January and February.

Fear of Coal Strike

There is increased ground for suspicion that part of the demand for steel shipments at this time is due to fear on the part of buyers that there will be another coal strike April 1. Opinion on this subject is divided. Nearly half the people in the trade think the balance of probability is that there will be a strike, and nearly half think the balance is the other way. Whether the chances are six in ten, five in ten or four in ten is merely a detail. Everyone recognizes that there is a possibility, hence there is a contingency to be provided for.

The steel industry is running largely on momentum. Operations are sustained not so much by fresh buying as by the

old orders that are left to be filled. Much the same condition exists with the customers of the industry. They may not be selling a great deal just now but they have old orders to fill. In some lines, such as builders' hardware, stocks are abnormally light and need to be brought up to the normal.

Those who were predicting a month and six weeks ago that there would be a decided falling off in steel production and shipments this month have now modified their prediction and expect the decrease to occur in January. The coal strike may loom more prominently then and make the predictions prove wrong even though they were well based as to general trade conditions. Others, however, perhaps the majority, have not expected any material decrease in steel movement for several months. Opinion among business men and bankers seems to be crystallizing now on the idea that general trade activity is marked to keep up for several months in the new year, and even to increase somewhat, with a decrease in activity about the middle of the year. If these predictions are right, the steel trade may be expected to move in harmony with the general condition.

Steel Prices

Finished steel prices are unchanged. Merchant pipe at 66 per cent. basing discount and wire nails at $2.70 are very strong. Sheets are fairly steady at 3.35c for common black, with only one or two mills shading. Tin plate is firm on the general basis of $4.75, with concessions for large orders smaller than usual. Bars, shapes and plates are moderately steady at 2.00c as an open quotation for small lots, with concessions for large lots as for some time past.

Buying Movement in Foundry Iron

In the past week the buying movement in foundry iron went farther. Large consumers, who at first were disposed to cover for only a portion, say a third or a half of their first-quarter requirements, later decided they had better cover for the remainder also, and went into the market again. All told, the business has been heavy, both in this district and elsewhere. Approximately all the consumers with definitely known requirements in foundry iron for first quarter have covered, while the furnaces seem to be correspondingly well sold. In the local market the business was done at precisely $25, valley basis. Furnaces would not concede a particle from this figure nor would buyers pay any more. Gradually the furnaces began to withdraw the $25 price in favor of $26 and the last has now done so, $26 being not merely an asking price but a firmly-held price. The foundry iron market has scored to square advance of $1 a ton.

Conditions in basic iron were different. The steel works that buy their iron did not have much steel sold for first quarter and therefore were indisposed to buy largely as they had little to cover, while there was another factor that, while in foundry iron the production is limited, in basic iron there are several steel works with surplus blast furnace capacity and some are quite ready to sell iron. There has been some buying of basic iron at $24.75 or $25, but not a great deal. Basic iron may decline from $25 whereas foundry iron may easily go above $26 by the end of the year. Bessemer is off 50 cents, being offered at $27.50, valley.

New Turn in Coke

Connellsville coke, which had been softening and softening as production increased and consumption experienced little change, has suddenly had a new condition thrust upon it, a heavy inquiry from the East for coke as domestic fuel. Dealers have been in the market for lots of 10 cars, 25 cars or more, ready to buy anything so it is "coke." The point is that the East had an exaggerated impression of the importance of the lake movement in anthracite, and expected a large increase in offerings when lake navigation should close. When it was found that this made little difference they turned to coke with a rush. Whether the movement will amount to much depends on the attitude of domestic consumers, to whom coke may or may not appeal. If it does, the coke market will be taken out of the hands of the furnaces by a greater factor being in the market.

That is, production of anthracite has been running at over 2,000,000 tons a week, while merchant production of Connellsville coke has been only at say 75,000 tons a week. A single per cent. of the anthracite business, therefore, turned into the coke market would mean more than 25 per cent. of the present production, which is almost all taken up by existing furnace contracts. Connellsville furnace coke opened last week easy at $6.50 and ended the week stiff at $7.50 to $8, and the $7.50 price was obtainable for descriptions of coke that blast furnaces would not accept. Foundry coke was $7 to $7.50 and advanced to $8 to $8.50, all according to brand. As to contract, a producer making a particularly good brand quotes $8.50 for the first quarter and $7.50 for the first half.

Pig iron at Buffalo has advanced to $27, furnace, or $1 above the valley level, an unusual divergence.

The furnaces that use purchased coke have not covered for first quarter and presumably expected to do $6 or perhaps less. Now there are chances they may have to pay much more, in which case the pig iron market will be stiffened.

SAFE PRACTICE IN HANDLING ACETYLENE GENERATORS

(Continued from page 21)

bad name and creates a feeling of insecurity about the process in the minds of those who are considering its use.

Those of you who are intimately acquainted with welding work know that perfectly sound and safe welds can be made in almost any class of work, but such safe, sound welds can only be secured when properly trained and skilled operators are permitted to work. In the ends of safety it is just as much your duty to assure yourselves that the men employed in welding in your establishments make sound welds, as it is for you to see that they work under safe conditions.

METAL-DURALUMIN

Bausch Metal-Duralumin is an aluminum alloy, which has the strength of mild steel, with a two-thirds saving in weight for sections of the same size. At the metals division plant of the Bausch Tool Co. this new alloy is rolled into sheets, forged, fabricated and heat treated the same as steel and the product is used for a large variety of purposes. During the recent development of metal-duralumin in the United States and Canada, applications have been found for its use in over one hundred different industries, and there is hardly a place where iron, brass, steel or copper is used that does not have at the same time economic openings for the use of this metal.

At the National Automobile Show in New York the exhibit will show connecting rods made of Bausch metal, such as are now being adopted by various manufacturers of automobiles, also demountable rims, timing gears, etc. The use of this metal in the making of connecting rods has a remarkable effect in the reduction of vibration and increase of motor power; demountable rims used on automobile wheels save from 40 to 80 pounds of weight per set, improves riding comfort, facilitates tire changing, because of non-rusting qualities, makes driving easier and prolongs tire life.

The metal is especially adapted for use in reciprocating and moving parts and promises in the near future to be as widely used as steel, brass or copper.

Metal-Duralumin takes a remarkable polish and does not require nickel plating, and for this reason is used by automobile manufacturers for automobile body trim.

Speaking at a meeting recently in St. John, N.B., Sir Henry Thornton, president of the C. N. R., stated that "the possession of the Grand Trunk lines over the border is not fundamentally connected with the railway problem with regard to Portland and that portion of the road passing through American territory. If we amputate these lines, somebody will get them; it would be better to have them at least on friendly terms with the C.N.R. than to let them fall into hostile hands. It would not be well for us to remove our nose for the edification of our face."

News From the Industrial Field

Alterations costing $100,000 will be made to the factory of Monk, Manhard & Dawson at Three Rivers, Que.

Development of electrical power in South Africa is creating an active market for electrical equipment there.

In operating at about 75% of the present capacity, the U. S. steel industry is running at more than 100% of pre-war production.

Vancouver, B. C.—Forty thousand tons of wheat were loaded this week at Vancouver for United Kingdom and continental ports.

The construction of a $900,000 terminal elevator at Port Arthur will soon be commenced by C. D. Howe & Co. for the N. Bawlf Grain Co. of Winnipeg.

McIlroy Belting and Hose Co., of Hammond, Ind., are now considering the erection of a plant at Brampton, Ont., the cost of which will approximate $20,000.

Owen Sound may install an asphalt plant in carrying out a proposed paving program. A movement is on foot looking to expenditure of $125,000 on harbor improvement.

Hamilton Bridge and Iron Works have been awarded the steel contract for the erection of an addition to the factory of the Zimmerman-Reliance Co. of Hamilton. Steel sash work goes to the Trussed Concrete Steel Co., Toronto.

The Bank of Montreal are having plans made for the erection of a branch bank at Vancouver, B. C. Plans are being prepared by K. G. Rea, Montreal. Cost of structure will be approximately $500,000.

Niagara Falls.—Dominion Insulator Co., Portage Road, expect to have their new plant completed by the end of the year, and machinery installed for a start early in 1923. This concern is a branch of the Ohio Brass Company, Mansfield, Ohio.

A deputation from Sault Ste. Marie recently waited on the Acting Minister of Railways at Ottawa and urged the granting of contracts for steel rails to the steel works at the Soo. The matter will probably be referred to the National railways directors.

Victoria.—During the past week, 153 mills reporting to the West Coast Lumberman's Association manufactured 109,604,102 feet of lumber, sold 78 738 343 feet, and shipped 71,089 558 feet. Thirty-nine per cent. of the week's lumber shipments, or 27,619 558, went by water, and rail shipments amounted to 1,449 cars.

Montreal, Que.—It is estimated by the Montreal Grain Clearance Board that about 155,000,000 bushels will be sent out in ocean bottoms from this port before the close of navigation. This compares very favorably with the previous season when approximately 138,000,000 bushels were shipped from this port, and a record was created.

Montreal, Que.—Approximately 100,000 sailors passed through the port of Montreal during the past season of navigation. Eighteen nationalities were represented, including Malays, Danish, English, Irish, Swedish, Norwegian, Chinese, Serbian, Arab, French, Russian, Jugo-Slavian, Italian and Esthonian.

At a banquet at Niagara Falls, Sir Adam Beck stated that engineers were already working out designs for another power canal looking to the development of a half million horsepower. He stated that the demand for power exceeds the capacity of the present Chippawa canal even when the fifth unit is installed.

Thompson Bros., Ltd., Liverpool, N. S., whose machine shop, with valuable equipment, was burned out recently, are again operating. A foundry, garage and pattern shop have been erected, 157 x 51 feet, and blacksmith and boiler shop 25 x 50 feet.

Trade commissioners' reports from South Africa say the corner of the trade depression had been definitely turned. Wool prices were practically double those of the pre-war period. Other agricultural operations have improved. Mines show increased output.

For eleven months ending November, imports of anthracite coal into Canada amounted to 2,012,169 tons as against 4,165,290 tons, the average for each of three preceding years and bituminous imports were 7,963,445 tons as against 10,639,745 for each of the three preceding years.

K. D. Marratt, retiring chairman of the Tanners Section, Toronto Board of Trade, stated that 1922 had shown a large turnover in leather for the Canadian trade, but that exports to Europe had been disappointing. Hides advanced from a low point fully 80 per cent. during the year, while leather did not advance more than about 20 per cent.

Sault Ste. Marie.—W. C. Franz, president of the Algoma Steel Corporation, states that while no new rail orders have been booked recently, the prospects are bright. The plant was being arranged and placed in a position to effectively handle new business when it actually materialized. He stated that the Corporation had quoted on a large order for the Canadian National Railways, and that if the bid were successful the mill would commence operations as soon as the order was received. The coal situation is improving. Two months ago he had despaired of getting in sufficient coal, but during the last few weeks a continuous stream of black diamonds has been arriving at the steel plant docks, and it is estimated that 200,000 tons have been unloaded. This will keep the mill running four months. The arrival of coal has taken a great load off the minds of the steel plant Executive, and they will now be able to go ahead and seek orders knowing full well that they will be able to make delivery when required.

Port Arthur, Ont.—With the construction of two new elevators during the coming year, storage capacity at the head of the lakes will be brought up to 61,000,000 bushels for the 1923 season. The Bawlf Grain Company announces that it will erect a terminal elevator with a storage capacity of 1,500,000 bushels at Port Arthur.

On his inspection trip of the Canadian National lines, Sir Henry Thornton recently visited the plant of the British Empire Steel Corporation at Sydney, where he saw rails in process of manufacture for the G. T. R. He inspected terminals and industries at Sydney mines. The C. N. R.'s new president was ready for work at 7 o'clock on the morning of his inspection.

House of Commons, London, Eng., recently voted a million pounds for unemployment relief. Officials of the Canadian Employment Service stated recently that they had received numerous demands from recently arrived immigrants for unemployment assistance, rent payment and other considerations. All they could offer was work, which, in some cases, was unacceptable.

Montreal, Que.—Wheat and flour exports from the port of Montreal continue active. A cargo of over forty thousand sacks of Canadian flour left here for Egypt recently, while large quantities were shipped to other foreign countries. Shipments to date are far in excess of those of the corresponding period a year ago.

Vancouver, B. C.—A special dispatch received here says the Dominion Government has decided to hand over control of the big grain elevator here to the Harbor Board. The financing of extensions will be left for the Harbor Board to carry out and will be financed by the Government under the same system as at Montreal, according to the dispatch.

Victoria, B. C.—The Argentine Republic forms an important market for British Columbia lumber, according to F. K. Vigor, an electrical engineer in La Plata, who has arrived in Victoria. In view of the fact that there is no native softwood in the Argentine, and only a limited quantity of hardwood, there is a great demand for lumber from Canada.

Winnipeg.—A terminal elevator with a capacity of 1,500,000 bushels will, it is reported, be erected at Port Arthur by James Stewart, president of the Maple Leaf Flour Mills, according to authoritative information obtained here. The cost will approximate $850,000 and construction will be commenced during the forthcoming winter. The site selected is near Thunder Bay elevator.

Vancouver, B. C.—During the week, the first lot of wheat to leave the Pacific coast for South America was loaded and several thousand bushels were consigned to this market. It is believed that a substantial trade will be developed in this line, whilst the recent earthquakes on the Chilean coast will, it is anticipated, result in increased demands for lumber, lime, and cement from British Columbia.

Vancouver, B. C.—The outstanding feature of the metal production of Canada during the first six months of the present year was the gain made in gold output by the two important producing provinces, Ontario and British Columbia, amounting to an increase of some 42 per cent. over the first six months of 1921. The higher prevailing prices and more active markets for silver and lead have been reflected in gains in production of these metals.

St. John's Nfld.—According to report, the British Treasury has signed a guarantee for $10,000,000 recommendation of the Trades Facilities Commission for the establishment of pulp and paper mills at Humber, Newfoundland. The Newfoundland Government has guaranteed the contractors, Armstrong Whitworth Company, a similar amount. The initial work has already begun.

St. Catharines, Ont.—Work on Welland Canal will be continued during the winter, except in very severe weather, according to an announcement by Chief Engineer Grant. There are about two thousand men engaged in the work. A few men have been laid off on sections No. 1 and 2, but work on sections 3 and 4 will be maintained up to normal point.

Canadian exports for November amounted to $132,000,000, a record for the year. It is expected that the total trade for 1922 will exceed that for 1921 by about $80,000,000. The Canadian railways have been in shape to expedite crop shipments this fall and this has helped materially to produce the record, which is higher than that attained by any other country of comparable population.

Toronto.—The British-American Oil Company is enlarging its Toronto refinery by adding a new process building which contains the latest machinery for the production of certain lubricating oils. This plant will enable it to manufacture oils at present in demand which heretofore it has not made in large quantities. The company has also established six new branches in Ontario and Quebec, each of which has large tank storage accommodation as well as warehouse and office facilities.

Fort William.—Movement of the crop east from Fort William by the railway this season has totalled 3,598,971 bushels, compared with less than 1 000,000 for each of the years 1915 and 1912. By boat this year, there have been shipped from Canadian Pacific tracks 82,923,908 bushels, against 68,168,553 bushels in 1915, and 52,043,000 bushels in 1912. Total shipments from the head of the lakes have amounted to 86,522,897 bushels this season, compared with 52,991,845 bushels for 1915 and 68,683,557 for 1921.

Vancouver, B. C.—Application is reported to have been made to the Dominion Government by the Marconi Wireless Telegraph Co. of Canada for a license to erect and operate in the vicinity of Vancouver a continuous wave wireless station costing approximately $2,000,000, and capable of communicating direct with Great Britain, Australia and the Orient. It is said that the company will erect other stations situated at Montreal, Toronto and Winnipeg. A total expenditure of $5,000,000 is planned by this company.

Montreal, Que.—A total of 21,530 head of cattle were shipped from the port of Montreal during the past season of navigation, as compared with 31,217 head for the season 1921, a decrease of 9,687 head. Of the above total shipped in 1922 there were 7,615 head from the United States, so that the total number of Canadian cattle that went forward to the British markets from this point was only 13,915 head. There was no export business done in sheep during the past season, while during the preceding year shipments amounted to 4,064 head.

Whitby will vote, at the municipal elections, on a by-law to grant certain concessions to a factory described in the daily press as "utilizing the products of the Imperial Steel Corporation at Collingwood." It will employ a hundred hands and spend $75,000 on factory equipment. The town is asked to guarantee $50,000 of the company's bonds are given fived assessment. Samuel Jeffrey & Son, harness manufacturers, recently burnt out in Port Perry, may also locate in Whitby. Concessions in taxation and free light and water are proposed.

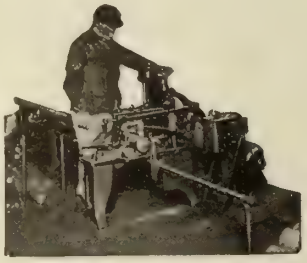
Vancouver, B. C.—The herring hauls of the Pacific Coast may yet rival the North Sea. According to Gosse-Millerd, there have been some very large catches of herring made off the coast of British Columbia. In fact, the firm says that they themselves have caught as much as 200 tons of herring in one day, which would probably mean one and a half million fish. Their total catch during the last season, which begins about the middle of October and ends about the middle of February, was in the neighborhood of 50,000 tons—about 400,000,000 fish.

Vancouver, B. C.—November saw a new record established in the movement of Western Canadian grain through the port of Vancouver. Approximately 3,700,000 bushels, or considerably more than half of last year's total shipments, have passed through the local elevator during the month. December, it is stated, will be another big month for grain shipments, about 4,000,000 bushels being due to move from Vancouver for the United Kingdom and the Orient. Total grain booked and shiped of the 1922 crop, for the United Kingdom and the Orient, now amounts to about 10,000,000 bushels.

Ottawa.—A further amelioration of economic conditions is indicated in the report of the labor situation of the Dominion Government for the month of October. The price movement was downward, both the index number of wholesale prices and the weekly budget being slightly lower. The time lost due to industrial disputes showed a decrease from the previous month and unemployment was lower. The cost of a family weekly budget of 29 staple foods in some 60 cities was $10.23 in October as compared with $10.28 in September, $11.48 in October, 1921, and $15.83 in October, 1920, and $7.99 for October, 1914.

Manufacturers interested in shipping via Panama Canal to British Columbia or other Pacific ports, are considering whether regular steamship service from Canadian Atlantic ports would be warranted. It is pointed out by the Canadian Manufacturers' Association that various factors would have to be considered, such as rates from shipping point to Montreal or St. John and terminal charges. Rates from New York are quoted ranging from 30 cents per 100 pounds on heavy iron and steel goods, and as high as $2 per cwt. on small lots of highly manufactured goods. The element of time also has to be considered. It is understood that from New York to Vancouver shipments are made in approximately thirty-five days.

With reference to the forthcoming Empire Trade Conference, Arthur Balfour, one of the leading figures in the British steel trade, in an interview, says if the conference results in nothing further being accomplished than placing emigration on a sound basis it certainly will be warranted. As to the export trade with the Dominions, Mr. Balfour says the only way it can be improved is to "give the Dominions exactly the kind of goods they require, instead of forcing on them goods which we think they want, as we have done in the past."



SIMONDS
HACK SAW
BLADES

Hack Saw Machines equipped with Simonds Blades produce more work at a minimum of expense. These blades cut rapidly, hold their cutting edge longer and do not shell teeth.

They are made of special steel and heat treated by an exclusively Simonds method to bring out the utmost in cutting efficiency and lasting qualities.

EXTENSION COURSES IN EXPORT TRADE

At the suggestion of, and in co-operation with the Department of Trade and Commerce, extension courses in export trade will be given at Toronto University, Jan. 15 to 27, and at McGill Univeristy, Montreal, Jan. 29 to Feb. 10. The course is intended primarily for export managers, and all those engaged in export trade, but others interested may enrol. It is an intensive course of two weeks' duration and the instruction has the two-fold purpose of introducing business men to the underlying principles of export trade and of making them familiar with the practical details of management. The course will proceed under the following heads:—Principles of International Trade; Economic Geography; Transportation; Trade Currents and Cycles. Under these heads consideration will be given to conditions determining volume, diversity, and direction of a country's trade; survey of the geographical background (climate and geologic) of the development of modern trade; railroad freight rates; railroad facilities in export trade; a study of economic changes from the standpoint of the trades.

Special trade discussions and demonstrations will be conducted by Lieut.-Col. L. M. Cosgrove, D. S. O., and R. S. O'Meara, B. Com., of the Commercial Intelligence Service, Ottawa. These will deal with Government Services and their Relation to Foreign Trade; Documentation; Packing for Egypt; Foreign Correspondence and Representation and Salesmanship Abroad.

TROUBLES OF GERMAN STEEL INDUSTRY

Handicapped by the difficulty of obtaining foreign credits, the German steel industry is finding it hard to cover with foreign ores and scrap the loss of the iron-ore resources of the Lorraine basin. (It is estimated that the consumption of foreign iron ore, much of which is imported from Newfoundland, and scrap is now about 1,000,000 tons and 100,000 tons per month, respectively.) The progressive fall in the purchasing power of the mark has seriously affected the actual value of matured and outstanding credits and has interposed obstacles in respect of producers' replenishment costs. This can readily be understood when it is remembered that the normal basis of payment gives as a minimum 15 days' and as a maximum 6 weeks' credit, within which periods recently the internal value of the mark has fallen rapidly. Forward covering of exchange has become both troublesome and expensive and even at times quite impossible.

MAY CURTAIL COAL SHIPMENTS

C. A. Magrath, Chairman of the Federal Advisory Fuel Committee at Ottawa, was informed to-day by C. E. Spens, Federal Fuel Distributor, that, because of the acute shortage of anthracite in the United States, "there is no immediate prospect, if any at all, of equalizing the deficit existing on December 1 in Canada's allotment," amounting to 50 per cent. of last season's imports. "Rationing and compulsory mixing of steam with domestic sizes have been inaugurated in our most populous districts, which have heretofore been accustomed to using only domestic anthracite," Mr. Spens declared. "Other substitutes are also being employed. We have no information that similar drastic steps have been adopted in Canada."

FAVOR OF SAVING WAGE

Defending child labor laws and advocating strict immigration laws, in order to lessen materially the ranks of three million unemployed in U. S., James J. Davies, Secretary of Labor, further claims that strikes could be averted early by mutual understanding between capital and labor.

"Strikes might easily be averted," said he, "if the committees representing both labor and capital would meet around council tables sixty days before a strike, instead of waiting sixty days after.

"There is no one who will question the right of labor to organize. It has the same right as capital to organize.

"The man who advocates cheap labor is not much of an American, to my notion of thinking.

"I am opposed with all my heart and soul to the so-called living wage. It is not American for a man to receive just enough for his toil to pay all of the bills on Saturday night. I say it is all wrong in our land. I am against the living wage and in favor of the saving wage. There should be enough in the envelope each week so that the American family may live as human beings. There should be enough so that the children may be educated. There should be enough so the things in life worth living for will not be crowded out.

"We want the American laborer paid so his children may be kept in the home with their mother instead of being sent to factories. Eighty per cent. of our criminals come from neglected children. And neglected childhood comes from the father receiving an insufficient wage."

Mr. Davis said the Department of Labor had taken a firm stand on the "3 per cent." law regulating the immigrants to the United States.

"We have 3,000 000 men out of work right now in the United States," he said. "Why should we allow foreigners to come to add to the burden?"

DON'T WORRY

Worrying has the same effect upon your health and your mind that racing the engine while the automobile is standing still has upon a motor car. It uses up a lot of fuel and energy without getting you anywhere, and the more you do it the less fit you are to make any real progress.

Tooling Up Your Engine Lathe for Turret Work

Jarvis Tappers and **Quick Change Chucks** and **Collets** are absolute necessities in to-day's production scheme.

They are developed to a high degree of perfection and the **Geometric Tool Company** recommends and furnishes them as a fitting adjunct to their line of threading tools.

Jarvis Collets convert an engine lathe into a turret lathe by simply using one of the **Jarvis Quick Change Chucks,** which allows the use of any number of different tools.

The Jarvis High Speed Tapping Device is superior to any other.

It has a ball drive and ball reverse, making easiest action, with no clinching or binding. Reverse motion faster than the drive.

Specially designed Chucks make special taps unnecessary.

Jarvis Quick Change Chucks and Collets consist of a chuck or locking member and a sufficient assortment of collets for any job.

Where one hole is drilled, reamed, counterbored, tapped and a stud set, or any two of these operations are done with one spindle, the Jarvis Quick Change Chucks pay for themselves in a very short time. Changes are made without stopping the Drilling Machine or Lathe.

There is no burring from constant use to interfere with the easy entrance or operation of the Collet. If your product requires drilling, counterboring, tapping and stud setting, you need to know about the Jarvis. The booklet tells the complete story.

The "why" of Files

Why does a file cut cleanly? Why does it not grow dull at the first few strokes? Why does it do its work with least effort on the part of the workman?

Properly shaped teeth, thorough hardening, the right adjustment of balance from point to tang—these are the "why" of a good file.

Simple! Yet it is faithful, scientific attention to these cardinal points that have made these brands of files the standard of quality:

In order that the announcements of your wants, machinery for sale, etc., etc., shall not be delayed, please try to have them in our office with the Tuesday morning mail.

Canadian Machinery

If you want something unusual

and it isn't advertised here, the logical thing would be to advertise for it. You'll find that a small ad. in the Classified Advertising Section will save you a great deal of time in locating men or machinery. Look over these pages and if you don't see what you want, send us your copy to-day for next week's issue.

CANADIAN MACHINERY

Classified Advertising Section

143-153 University Avenue
TORONTO

The Brown-Boggs Co., Limited
HAMILTON, ONT.
Grey Iron.

Fisher Motor Co., Limited.
ORILLIA, ONT.
Die Castings.

Sully Brass Foundry, Limited
618 Brock Ave., TORONTO, ONT.
Brass, Bronze, Copper and Aluminum.

Canadian Rumley Co., Limited
Queen West and Abell Streets,
TORONTO, ONT.
Grey Iron.

Galt Malleable Iron Co., Ltd.
GALT, ONT.
Malleable.

S. Vessot & Company
JOLIETTE, QUE.,
Grey Iron, Brass and Aluminum.

Miller Bros. & Sons, Limited,
120 Dalhousie St., MONTREAL.
Grey Iron, Semi-Steel Castings up to 10 tons.

Can. Mead-Morrison Co., Ltd.,
MONTREAL, P.Q. WELLAND, ONT.
Grey Iron Machinery Castings up to six tons.

Hugh Park Foundry Co., Ltd.,
OSHAWA, ONT.
Grey Iron, Patterns, Etc.

Hull Iron & Steel Foundries Ltd.
HULL, CANADA.
Steel, Manganese, Chrome.

John T. Hepburn, Limited
TORONTO, ONT.
Grey Iron.

H. Mueller Mfg. Co., Ltd.,
SARNIA, ONT.
Brass, Bronze, and Aluminum.

Can. Hanson & VanWinkle Co.
LIMITED
TORONTO, ONT.
Monel, Aluminum, Brass, Bronze, Grey Iron.

Tallman Brass & Metal, Ltd.
HAMILTON, CANADA
Brass, Bronze, Manganese Bronze, Aluminum.

Dom. Foundries & Steel, Ltd.
HAMILTON, CANADA.
Steel Castings all sizes.

Manitoba Steel Foundries, Ltd.
Office Winnipeg. Works Selkirk, Man.
Steel Castings up to 5,000 lbs.

Brantford Brass Foundry Co.
BRANTFORD, ONT.
Aluminum, Brass, Bronze, Specialty.

The Katie Foundry
GALT, ONT.
Grey Iron, Semi-Steel, Brass, Aluminum.

William Kennedy & Sons, Ltd.
OWEN SOUND, ONT.
Steel, Malleable and Heavy Grey Iron.
See Advertisement Page 7

Machinery & Foundries, Ltd.
BROCKVILLE, ONT.
Light and Medium Grey Iron.

A. F. McCulloch
OSHAWA, ONT.
Brass, Alum. Castings—Wood, Metal Patterns.

Corbet Foundry & Machine Co. Ltd.
OWEN SOUND, ONT.
Grey Iron, Brass.

Fittings Limited,
OSHAWA, ONT.
Malleable, Grey Iron, Brass, Aluminum.

W. W. Wells
370 Victoria Street, TORONTO, ONT.
Nickel and Monel Metal.

The Robert Mitchell Co., Ltd.
64 Belair Ave., MONTREAL.
Light Grey Iron.

Canadian Steel Foundries, Ltd.
MONTREAL, QUE.
Steel and Ferro-Alloy.

Langley & Austin,
GALT, ONT.
Copper, Bronze, Brass and Aluminum.

Maxwells, Limited
ST. MARYS, ONT.
Light Grey Iron, Tinning same a specialty.

The Eureka Planter Co., Ltd.,
WOODSTOCK, ONT.
Specialty Light Grey Iron.

Lindsay Foundry and Pattern Works, Limited
Victoria Avenue, LINDSAY, ONT.
Grey Iron and Semi-Steel

Dominion Engineering Works, Limited
MONTREAL, QUE.
Grey Iron and Semi-Steel to 75 tons.

Smith's Falls Malleable Castings, Limited
SMITH'S FALLS, ONT.
Malleable.

Imperial Foundry Company
2167 St. Clair Ave., TORONTO, ONT.
Grey Iron Castings. Phone Junction 7935.

International Malleable Iron Company, Limited
GUELPH, ONT.
Malleable.

YOU ARE INVITED

The foundries represented on this page are well equipped, progressive, and their product is of known high quality. If you are a foundry owner and you can say the same of your service and product, we shall be glad to list you in this department. Write us for particulars.

Canadian Machinery & Mfg. News

Why Don't You Write?

HARDLY a week passes that Canadian Machinery does not receive copies of this paper returned by the postal authorities because of the change in firm names or the address of some whose names are on the mailing list. Sometimes complaints reach us of the non-delivery of mail matter. It is not till the receipt of such complaints or the return of the paper, as the case may be, that we obtain any knowledge of the changes or removals of persons or firms. The adoption of the co-operative spirit on your part by notifying changes would make things a good deal more pleasant for both parties. The MacLean Publishing Co. want their mailing list to be in such shape that they will be able to render the perfect service to their subscribers. There is a lot of valuable trade matter mailed by this company and if you don't receive it—well, the fault is entirely yours.

DUMORE HIGH SPEED GRINDERS

combine perfect balance with correct speed to insure a degree of accuracy never before obtained with portable grinders. Write for information concerning what they will do for you.

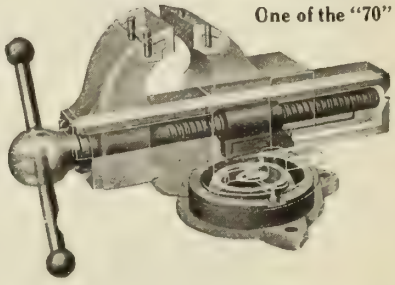
The Handle STAYS Where You Leave It



One of the "70"

The set screw and tension spring at which the arrow points prevent the handle from sliding down its full length every time the mechanic lets go of it; a feature that saves a good deal of time in the course of a day. This is one of *seven Special Features* that make Parker Vises unusually serviceable. For eighty years they have been standard tooling equipment in the biggest shops of the United States and Canada.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

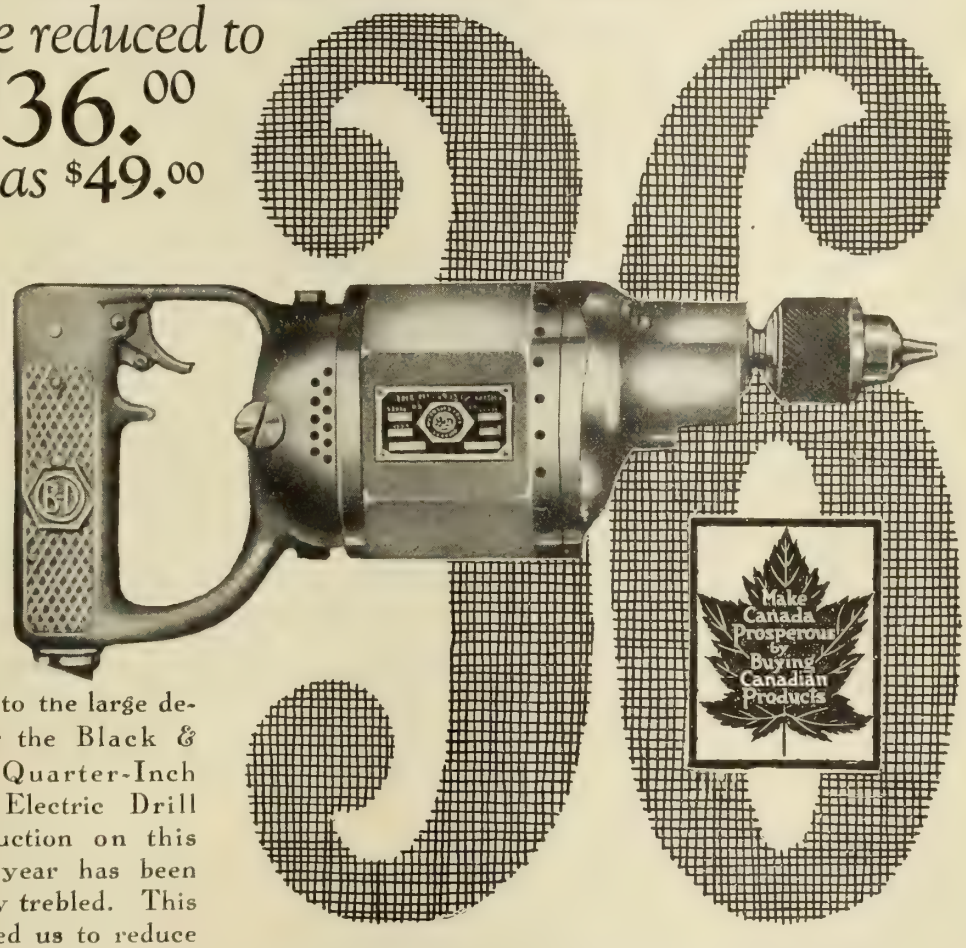
BLACK & DECKER

¼ inch PORTABLE ELECTRIC DRILL

"With the Pistol Grip and Trigger Switch"

Price reduced to
$36.00
was $49.00



Owing to the large demand for the Black & Decker Quarter-Inch Portable Electric Drill our production on this unit this year has been practically trebled. This has enabled us to reduce our manufacturing costs, and in accordance with our established policy we are passing the saving on to you.

This is the standard Black & Decker Quarter-Inch Drill, exactly the same as has previously been sold for $49.00 except that it has been improved by the addition of a geared-nut chuck instead of a hand operated chuck.

A new folder describing this unit in detail, INCLUDING SPECIFICATIONS, is yours for the asking.

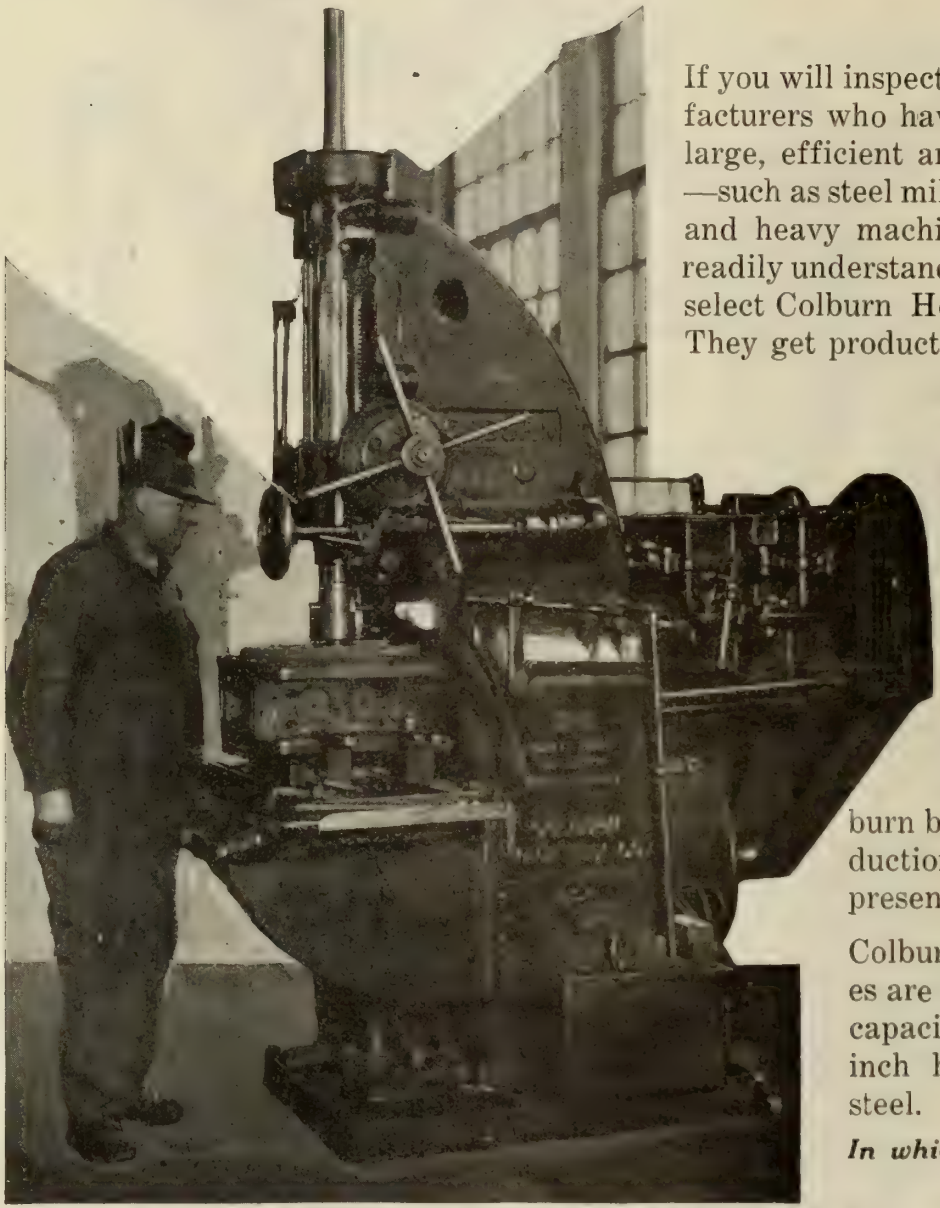
COLBURN

Heavy Duty Drill Press



If you will inspect the plants of those manu facturers who have established a name fo large, efficient and economical productio —such as steel mills, car shops, engine shop and heavy machine tool shops—you wi readily understand why these manufacture select Colburn Heavy Duty Drill Presse They get production!

Work that would ordina ily necessitate the use of lathe or boring mill done far more econom cally with the Colbu Heavy Duty Drill Press.

If your work consists drilling, reaming, tappi or some similar operatio of an exceptionally heav character, there is a Co burn built to do it—and at a pr duction cost greatly below yo present figures.

Colburn Heavy Duty Drill Pres es are built in several styles wit capacities up to the limit of inch high speed drill in soli steel.

In which style are you interested? Send for Bulletin.

On Driving Box Work

Boring and chamfering Locomotive Driving Boxes is an interesting example of the wide range of work handled by Colburn Heavy Duty Drill Presses. This versatility of operation keeps them always busy—your shops will charge no "dead time" against a Colburn. Drilling, reaming, boring and tapping jobs on car and locomotive parts are handled with equal dispatch—making the Colburn Heavy Duty Drill Press a machine of continuous efficiency.

For odd jobs or quantity production, Colburn Drill Presses mean lower costs per operation—investigate Colburn possibilities in **your** shop.

The Business of

ALFRED HERBERT, LTD.

consists of two main divisions: viz., the "Manufacturing" and the "Factored." The first consists of two well-equipped, self-contained shops comprising Laboratories, Foundries, Machine and Erecting Shops, employing upward of 3,000 men in the production of Automatic and Turret Lathes, Milling and Drilling Machines. The second or "Factored" Division acts as sole selling agents in various countries for leading British and American makers of machine tools.

The combined result is an organization able to quote on the most suitable machines for any given work and to deliver them tooled up with all the necessary tools and fixtures. Complete Plants can also be quoted on for the production of complete units when desired.

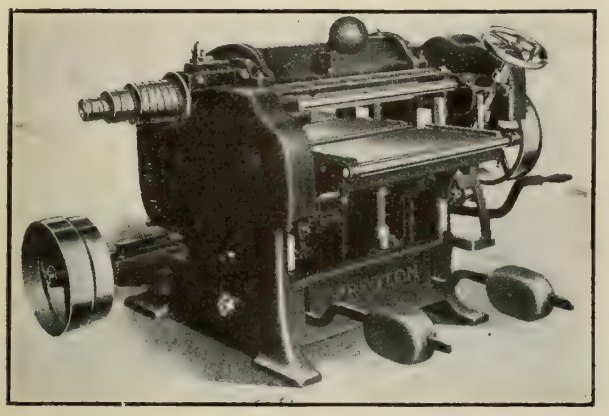
"Service and Satisfaction to the Customer"



from the use of

PRESTON
WOODWORKING MACHINERY

is the idea of more importance to us than anything else in this world. We put into a machine the best material we can and all the ability we have and then we stand behind it until **absolute satisfaction** results.

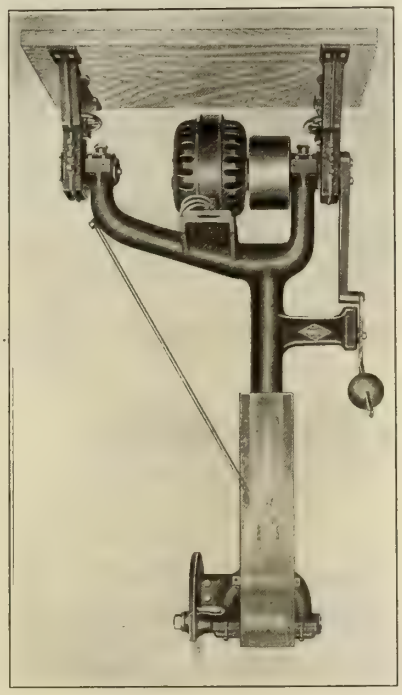
No. 121 "Preston" Heavy Pony Planer

This cut shows standard machine. Can be built with:

(1) Straight roll or divided rolls or sectional roll and chipbreaker.

(2) Square cylinder or round 4 knife cylinder.

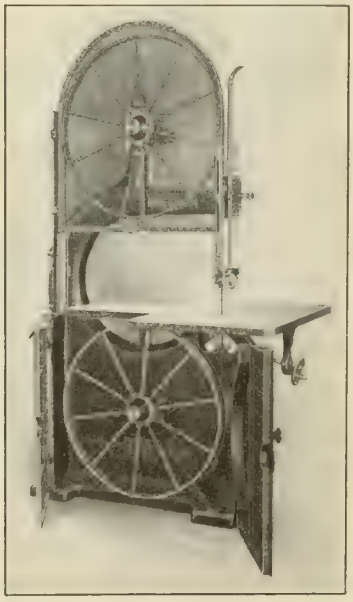
(3) Babbitt Bearings or S.K.F. Ball Bearings.



No. 132 "Preston" 36" Band Saw

We guarantee that breaking of saws will be reduced to a minimum on this machine by reason of our almost perfect tension device and style and guide.

Made with or without guards. Wheels are all steel, covered with ¼" solid rubber bands. Supplied with 3 H.P. motor for individual drive if desired.



No. 152 "Preston" Motor Driven Swing Cut Off Saw

Embodies every requirement of a swing cut-off saw. Note the belt guard. Built with special arrangement providing for use of an endless belt.

Larger Output at Lower Expense—How?

Efficient equipment is the only answer to this problem. We can supply this **efficient equipment** because we have been unceasing in our efforts toward keeping our line thoroughly modern and up-to-date.

Let Us Send You Illustrated Bulletins of Our Line!

How the Norton Company of Hamilton Protect their New Plant

Property Losses are as Unnecessary as they are Expensive

Of all the factors which contribute to "overhead" that of Property Loss (including petty thefts and damage to property, etc.) should really have no part. It is an unwarranted charge because it is absolutely unnecessary.

A Frost Non-Climbable Property Protection Fence around your property limits not only will eliminate these Property Losses but will considerably lessen your watchman service costs by lightening the work.

There's another feature too—the surrounding grounds can be utilized for additional storage with perfect safety. Besides keeping out all undesirable trespassers—day and night—it will centralize your workmen's entrance and exit.

Let us send a Representative to plan and quote on Property Protection Fence for your plant.

"Do It Ten Times Faster"

with the

"WODACK"

Portable Electric

DRILLS, GRINDERS & BUFFERS

with the automatic-stop-switch control

"Wodack" Portable Grinder saves a man a day

Day in and day out, under constant heavy duty, the "Wodack" will stand the gaff. It has been our endeavour to make them so they will never ask for "time off" or an expensive vacation in the repair shop. Our rugged, hardy motors will stand up under the most trying strain a practical man would subject a tool—it will meet the most severe test of every day service. Our motors have been stalled for three minutes at a time without injury. The automatic swith cuts out the needless expenditure of motor rewinding.

"Wodack" Electric Tools are made in various sizes ana types (52) *ranging from ⅛ in. to 1¼ in. capacities for drilling—and three to six inches for grinding.*

"Wodack" Combination Portable Electric Drill and Grinder

Two Tools in One

This new "Wodack" Combination Drill and Grinder fills a long-felt want in those shops and factories where hand drilling and grinding operations are performed, yet not enough to warrant the purchase of two separate machines. The illustration shows the "Wodack" when used as a portable electric drill and also when used as a portable electric grinder. One motor gives a satisfactory speed for both drilling and grinding. The only tool of its kind that grinds as efficiently as it drills.

This is the lightest and most powerful ⅜" drill in the world to-day. It's a popular drill for general production purposes in metal and woodworking plants. Complete weight, 8 lbs.

Here is a two-speed ⅝" drill that is a crackerjack for general all around drilling and adapted to repair work in machine shops, garages, metal and woodworking plants.

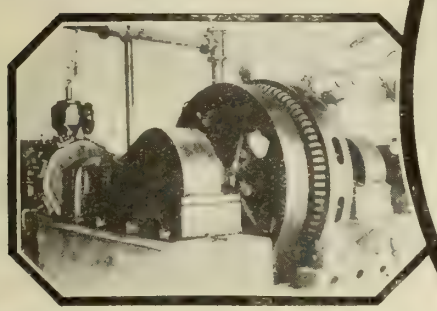
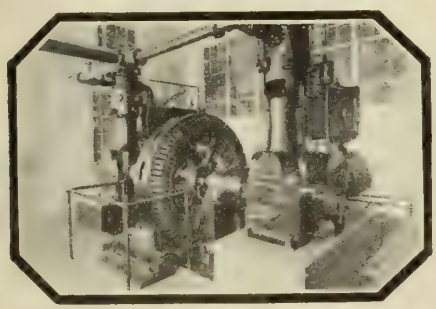
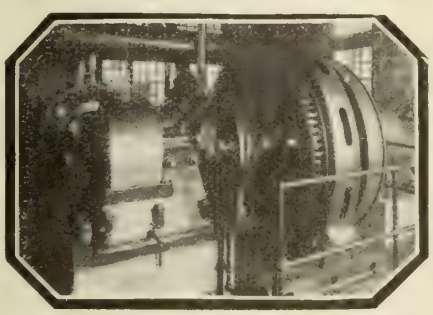
Westinghouse Builds Synchronous Motors for Every Size and Type of Compressor



200hp. 225rpm. Westinghouse Synchronous Motor driving Worthington Compressor.



400hp. 200rpm. Westinghouse Synchronous Motor driving Sullivan Compressor



187hp. 150rpm. Westinghouse Synchronous Motor driving Ingersol-Rand Compressor

An Important Feature:

Low Cost of Operation

In low cost of operation lies one of the main secrets of profitable manufacturing today. Low cost of operation is one of the outstanding features of the Westinghouse Synchronous Motor on compressor drive. A second feature is compactness; a third high efficiency at full load, and its ability to operate for long periods with little or no attention.

In addition to these advantages, Westinghouse offers a standard synchronous motor built in many sizes and styles for all types of compressors. This self-starting motor is compact, built of tested materials and has been designed by expert electrical engineers.

The Surest and Most Convenient Protection for the Machine Shop

PLANT executives in leading plants all over Canada have been quick to appreciate the convenience and protection of partitions of wire and iron work.

Sturdily effective yet not cumbersome, they are a positive protection for tools or stock of any kind. They do not obstruct light, and are fireproof and always look neat. Their erection is a simple matter and they can be put up or taken down quickly.

Wire and Iron work has many uses in manufacturing plants, including partitions, built in unit form, for tool enclosures, stock rooms, machine guards, window screens, guards, elevator enclosures, etc. The products of the Canada Wire and Iron Goods Company have successfully met every requirement of the modern plant. Unmistakable evidence of the quality of our work is shown in the fact that during recent years we have been forced to increase our factory floor space more than 200 per cent.

SPRINGS

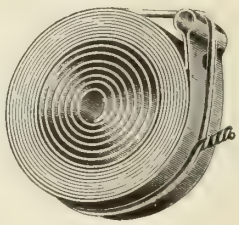
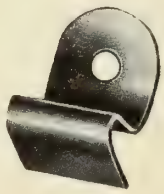
"Barnes-Made" Quality



The wide diversity of springs required in to-day's mechanisms—and there is virtually no mechanism which, somewhere in its make-up, does not rely upon a spring for successful operation—has necessitated a great accumulation of facilities for their manufacture.

Through years of specialization on this line of manufacture, the Wallace Barnes Company has been called upon to produce practically every kind of spring in operation. Its facilities have extended accordingly, so that to-day these cover the entire range of production of high-grade springs.



Quality, which includes both accuracy in dimension and superior finish, is never found wanting in "BARNES CANADIAN SPRINGS"; each operation being carefully watched to ensure that the customer's interests are looked out for throughout the various processes of manufacture.

"Barnes Canadian Springs" are made only to customers' specifications by Canadian workmen. Your enquiries are solicited. Consult us freely on your spring problems.

Advisory Reports on Future Changes, Expansion Programs, Mechanical Equipment, etc.

There must be a difference

between the plant which is just so much floor space under roof and the one which has been designed to make possible the lowest production costs.

We Regard a Plant as a Machine on a Large Scale

You can employ any one of a hundred firms to make plans or build BUT you engage us for the larger purpose of obtaining the plant which is the most profitable from the standpoint of first cost and operating costs. SUCH A PLANT COSTS NO MORE, often less, and can be built with whatever speed you specify.

A Study of Your Conditions by Practical Engineers will bring a fresh viewpoint and may result in improvements which have never occurred to you.

A Critical Survey of what you are doing and a report embodying a program of practical improvements which are advisable only because they will more than pay for themselves, will enable you to wisely decide what is necessary to meet conditions, whether they be increased competition intensified by reduced demand or need for additional space.

Our Booklets and a Discussion of your problems will cost you nothing

FLEXILITE

Doubles Daylight—and Night Lights

BEFORE painting with FLEXILITE

AFTER painting with FLEXILITE

Daylight is Free Why Not Use It?

FLEXILITE Means Increased Efficiency — Cleanliness and Sanitation—Fewer Accidents — Contented Workmen. Lessened Light Bills.

The benefits derived from finishing interiors of plants with **Flexilite** are demonstrated in the actual photographs shown above. The well diffused light that results leaves no shadows. It enables each workman to handle his tools, and operate his machine with a sureness and precision that will reflect itself in increased production and a substantial decrease in spoiled jobs.

It means also fewer accidents. Careful investigation has clearly shown that the curve of fatal accidents in factories very closely parallels the curves of "hours of light" and "cloudy days." It is well nigh self-evident that the remedy is in better lighting.

After painting with Flexilite it will be found that greatly increased light has resulted and that the number of hours during which artificial light is used, can be materially decreased with a corresponding reduction in lighting bills.

ROUND THE WORLD WITH LANDIS THREADING MACHINES

In the Plant of a Flour Mill Builder—Barcelona

Their world-wide distribution is an unmistakable indication of the worth of Landis Threading Machines.

In historic Barcelona, the ancient port of Spain, Landis Machines are well represented. The accompanying photograph was taken in the plant of Jose Pane, S. en C., manufacturer of Flour Mills in that city, and shows a 1½-in. Landis Threading Machine which has been 6½ years in operation there without repairs. Work shown is threading ¾-in. Siemens steel rods at each end a length of 20-in., operator having no difficulty in getting a production of 30 pieces per hour.

Investigate the Landis die, learn of the tangential disposition of chaser to work; interchangeability of chasers, and many other distinctive features.

The Marshalltown - Line

OF

THROATLESS SHEARS - BEVEL SHEARS
SPLITTING SHEARS - FLUE WELDERS

Cutting costs are materially reduced with the Marshalltown Line. Marshalltown Throatless Shears will take sheets and plates of unlimited width and cut curves of small radius in any direction. They have no equal for cutting in and out curves, straight or irregular shearing and circule work, etc. The Throatless feature allows any size material to be used—or cut from. Brief descriptions of these, together with our Bevel Shears, Splitting Shears and Flue Welders, are shown below:

No. 18 Throatless Shear—18 gauge, cuts to 1¾" radius. Hand power.

No. 18-P Throatless Shear—For hand or belt power. 70 revolutions of belt pulley per minute cuts 9 feet.

No. 18-M Throatless Shear—Motor drive; equipped with ⅛ h.p Motor.

No. 16 Throatless Shear—Cuts to 3" radius, 16-gauge material and lighter. ¼ H.P. Motor.

No. 16-BH Throatless Shear—Cuts to 3" radius up to gauge. Hand power with bench base.

No. 12 Throatless Shear—Cuts to 4" radius on material up to 12-gauge. ½ H. P. Motor.

No. 12-BH Throatless Shear—Cuts to 4" radius—up to 12 gauge material. ½ H. P. Motor.

No. 10-P Throatless Shear—Cuts to 4½" radius 10 gauge and lighter. 1 H.P. Motor.

No. 114-M Throatless Shear—For ¼" and lighter; cuts 5½" radius. Equipped with motor drive.

No. 112 Throatless Shear—½" and lighter; cuts to 10" radius. Cutters 10" x 1-⅞". 5 H. P. Motor.

No. 138 Throatless Shear—Capacity ⅜" and lighter. Cuts to 9" radius. 3 H.P. Motor.

No. 138 Rotary Bevel Shear—Will bevel plates up to ⅜" thick. A strong high class machine that will bevel plates in much less time than chipping. 3 H.P. Motor.

No. 34 Rotary Bevel Shear—¾" material and lighter. 7½ H.P. motor. For beveling edges of straight or irregular plates.

The Marshalltown-Schaefer Flue Welder was designed by an experienced Tool Maker who had years of experience in welding locomotive and super-heater flues.

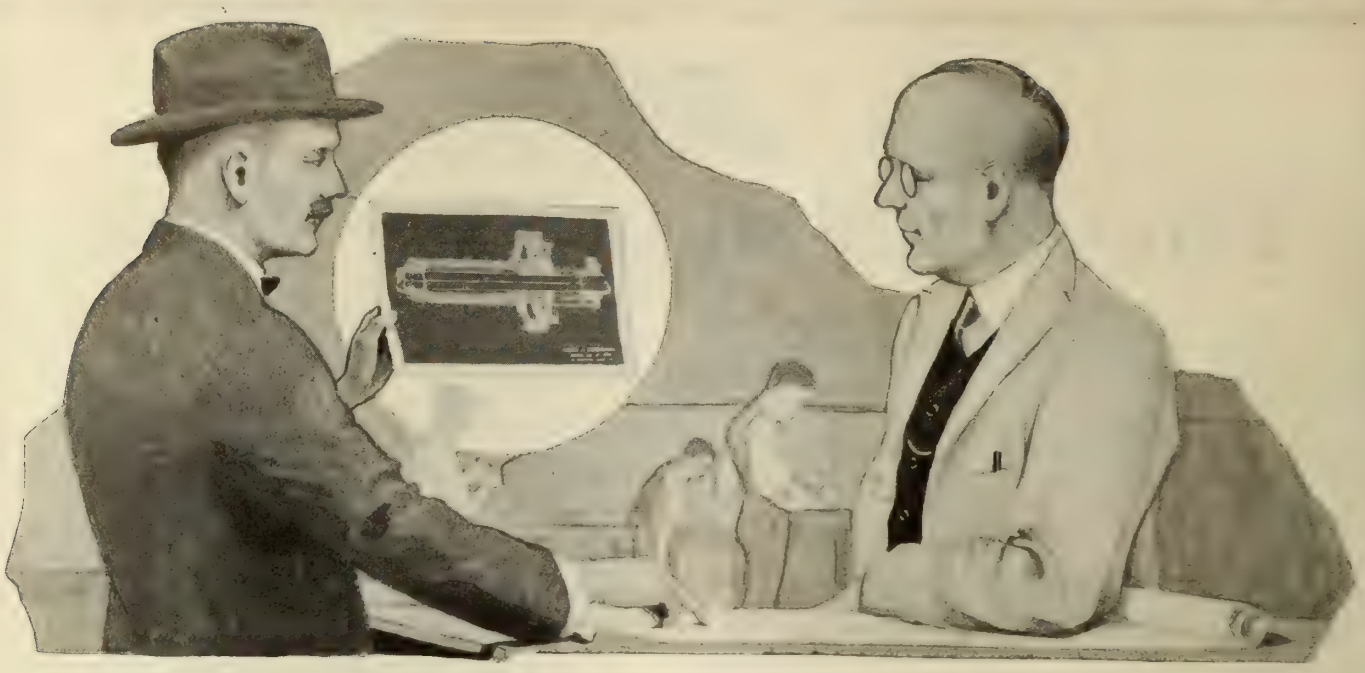
A distinctive feature is that the weld is made between two revolving rolls, welding both the in and the outside of the flue in such a manner that both sides are left in condition so that it is almost impossible to locate the place welded.

Flues from two inches to six inches in diameter can be welded by changing the rolls. Three sizes of rolls being furnished with each machine. Pieces up to nine inches in length can be welded on to the flue.

Marshalltown Flue Lathe—This is a heavy duty Lathe designed especially for cutting and chamfering safe ends and for cutting all lengths and sizes of flues up to six inches. Hollow spindle type, equipped with a three jaw Universal Chuck. Tool Carriage is equipped with two tools; one for cutting off the flues and the other for chamfering the ends of same. Made with an adjustable gage for safe ends up to nine inches in length.

Let us send catalogue fully describing the Marshalltown Line

MARSHALLTOWN MANUFACTURING CO.
MARSHALLTOWN, IOWA



A PHOTOSTAT Would Have Prevented Such A Mistake

LAYING the blame on the drafting room doesn't help us. Theoretically they should have noticed those transposed figures when they checked the tracing, but the fact remains that the error crept in in spite of the checking.

"And what is the result? It will cost us our entire profit on the job to correct the results of that mistake. And we could have bought several PHOTOSTATS with what we will lose.

"That mistake **couldn't** have occurred if we had made PHOTOSTAT copies of the blueprint instead of tracing it. The PHOTOSTAT makes photographic facsimiles so you don't even have to check them.

"And compare the time it takes to make PHOTOSTAT copies against the time it took our drafting room to trace that blueprint and to make additional blueprints. Why, it's a matter of minutes against hours. By copying blueprints, pencil sketches, drawings and orders with the PHOTOSTAT we can get all our work into the shop days earlier than we do now.

"I tell you, no matter from what angle you look at it, everything is in favor of the PHOTOSTAT.

"The PHOTOSTAT copies directly on sensitized paper and the cost per print is not over 25 cents.

"And we have any quantity of other kinds of work for the PHOTOSTAT. It will relieve our stenographers of a lot of copying—do it in far less time and with absolute accuracy. We can copy catalog pages, work sheets, contracts, production charts, letters, specifications, legal documents, and advertising layouts. The machine will more than pay for itself inside of six months."

Without obligation ask us for **"The Photostat and What It Will Do."**

CANADA'S PREMIER MACHINERY HOUSE

MR. H. W. PETRIE, SR.

THROUGH half a century of industrial expansion, through wars and rumors of wars, through financial panics and trade depressions, the H. W. Petrie Limited, has stood, and stands to-day in unchallenged supremacy, the acknowledged machinery headquarters for Canada—the firm with a national reputation for quality, service and fair dealing.

The policy of Efficiency in Service is one of the sterling qualities that have built up and sustained the public confidence in the H. W. Petrie Limited, for fifty years.

In Toronto alone we possess 130,000 square feet of floor space for the storage of modern machinery. This, and the excellence of our buying and selling connections, enables us to handle a contract of **any** size in the quickest possible time and at most reasonable prices.

Our facilities for repair work of every description (stationary and marine) are magnificent.

H. W. PETRIE LIMITED TORONTO

FORD-SMITH

Grinding and Polishing Equipment

Floor, Bench, Swing, Water Tool, Disc and Special Grinders---Polishers and Buffers

Ford-Smith Grinders have established a reputation for Quality. They have proven their ability to do quicker, better, more satisfactory work, at the same time keeping costs down to the minimum. There's a size of Ford-Smith Grinder to meet every grinding need.

Suitable grinding equipment will save you a considerable sum in production costs every year. You can feel sure, when purchasing a Ford-Smith Grinder that you are getting the very best. When installing new Grinding Equipment, decide to have Ford-Smith machines, and no other.

A large portion of our plant is devoted to the production of special machinery dies, gear cutting, jobbing work, etc. We have an expert engineering staff which can handle any planning work for you, and our modern tool equipment guarantees you a good machine carefully and accurately built.

SPECIAL MACHINERY

DIES, JOBBING WORK, ETC.

Many of Canada's largest firms have been satisfactorily served by us, for we can take your design or blueprints and build the machine or fixture to your requirements. We have made dies as large as 8 tons, and can make any style of die required. Send us your blueprints and let us quote you.

We also make a line of Milling Machines that have already established a reputation. When in need of a Miller you can't do better than install a Ford-Smith Miller.

Designed To Withstand High Pressure

The Mueller Composition Disc Globe Valve is built for the hardest kind of steam line service. Thickness and weight come where strength is most needed.

The threads are full length and tapered. The Mueller Composition Disc used in this valve enables it to withstand high pressure and high temperature. This valve is so constructed that it can be repacked without shutting off the steam.

Scientifically designed by engineers with years of experience and manufactured from the finest materials by expert workmen, Mueller "Globe A-3006" will give years of efficient and economical service. Send for a sample.

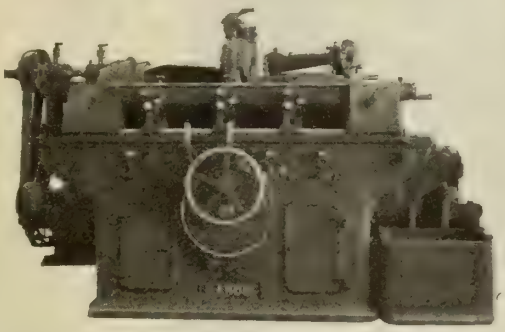
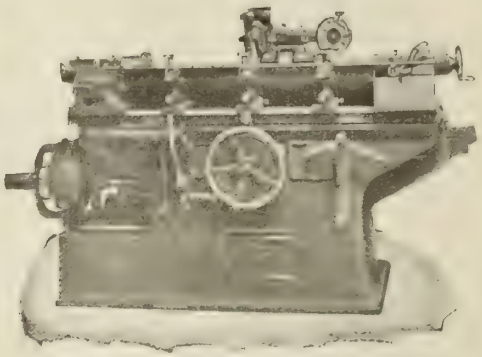
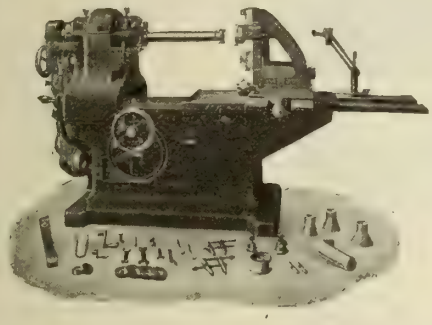
LANDIS



Plain Grinding Machines are strictly manufacturing machines for straight or taper, formed wheel or wide wheel grinding. They can be furnished with 6″, 10″, 12″, 18″ and up to 50″ swing.



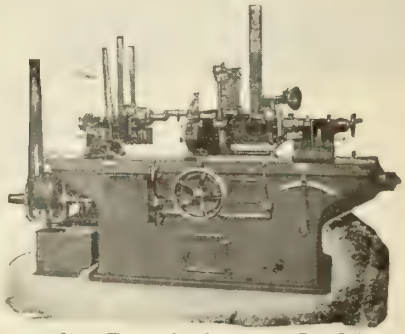
Universal Grinding Machines are adaptable for general manufacturing and tool room grinding of such parts as dies, reamers, gages, cutters, etc. They can be furnished in 10″, 12″ and 16″ swing.



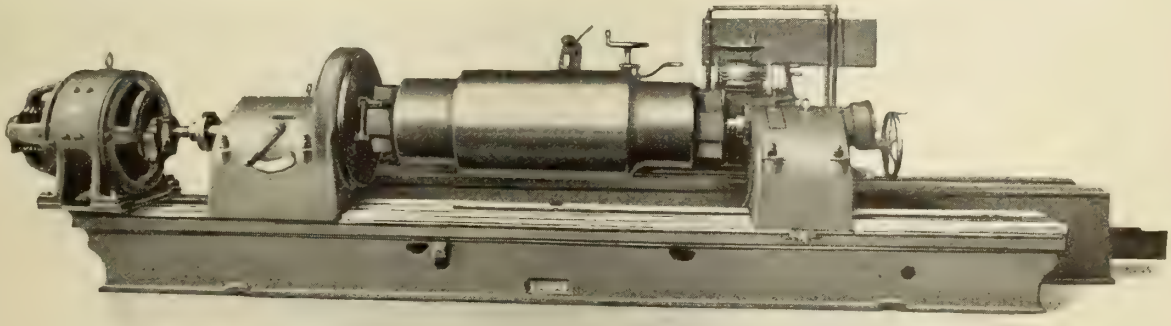
Cylinder Grinding Machines are designed particularly for use in garages and repair shops. They will accommodate any size or type of cylinder blocks.

REPRESENTATIVE "LANDIS" GRINDING MACHINES

Correct Design, Superior Workmanship and Constant Service —points of advantage which maintain leadership for Landis grinding machines.



Crankshaft Regrinding Machines are practically invaluable in service stations, repair shops and garages for all classes of grinding—pistons, piston pins, transmission gears, crankshafts and valves.



Heavy Roll Grinding Machines have a capacity for grinding rolls varying in weight from 500 to 50,000 pounds. The principle feature is the crowning mechanism for grinding either convex, concave, straight or taper.

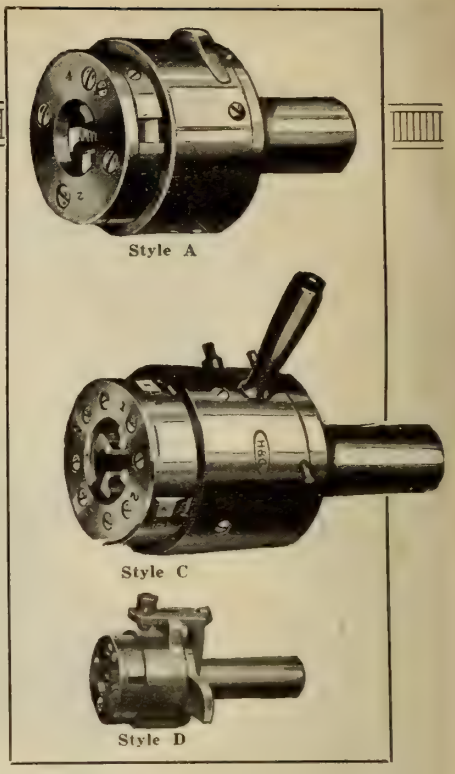
H&G



—the name of the Die-Head that has REVOLUTIONIZED THREAD-CUTTING throughout the world

Approximately 75% of the threads cut in the automotive industry are cut with H. & G. Die Heads. This has been accomplished within the short period of a few years, with a class of executives who are influenced only by these two requirements in their purchase of tools:

1. *Most efficient production*
2. *Highest degree of accuracy possible*

This record is silent tribute to the mechanical superiority of the tool and to the policy of the organization which produces it.

If you do any thread-cutting, H & G Die Heads will reduce your costs and give you better threads.

Our new ninety-six page catalog contains much valuable information gathered from original sources and presented for constant reference by operators.

You are invited to send for a copy.

H & G Die Heads are made in three standard styles and several sizes and are adaptable to all machines on which threading is done.

Style A is for Automatic Screw Machines like the Cone, Gridley, National Acme, and threading machines and bolt cutters in which the die head ROTATES.

Style C is for turret lathes, hand screw machines and similar machines in which the die head is held stationary. Style CC is for Cleveland Automatics.

Style D is a recent development and has met with great success. It is especially designed for Brown & Sharpe automatics but can be used on other machines cutting small work.

THE NEW *Little Giant* PIPE WRENCH

(TURN THE SHEET)

GTD

Introducing the — *Little Giant* PIPE WRENCH

On the Job

It gets into the holes and corners that the conventional pipe wrench can't touch. Look at the *end opening* jaws. They reach into cramped places just like a pair of pliers. They grip instantly and independently of springs.

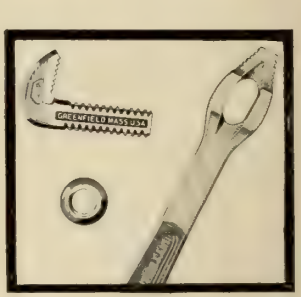
This *"Little Giant"* Wrench *takes hold* and *lets go* quicker than any other wrench you ever used, and we can guarantee that.

The Wrench Itself

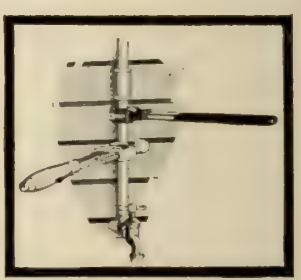
It has just three parts. Two powerful drop forged jaws and a nut, all three carefully heat treated. No cumbersome frame, no springs, no rivets. The new patented design gives extreme strength. (The 14 inch size, for example, has repeatedly withstood stresses in excess of 4700 inch pounds—2800 is Uncle Sam's test.) Finally, it has *double* the life of an ordinary wrench, because the moveable jaw can be engaged with teeth on both sides of the solid jaw. (See illustration)

The *"Little Giant"* Wrench will be made in 8", 10", 14", 18", and 24" sizes. The three smaller sizes are now in stock for immediate delivery. Hundreds of users are daily expressing their satisfaction with this new wrench.

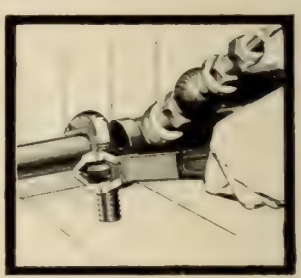
Let us tell you more about it.



ONLY THREE PARTS
Practically Indestructible
(Note teeth on both sides of jaw)



Showing the greater effective swing of the *"Little Giant"* Wrench when pipe is close to wall.



The *"Little Giant"* Wrench being used in a corner.

Mr. Reader:—
This is not a "trick" wrench. Hundreds of users have written us that it is the best pipe wrench they ever handled—from every point of view.

You want to know about a tool that lasts twice as long, and takes twice as much punishment—and we want to tell you.

[illegible] your letter head will bring you [illegible] and prices by return mail.

1923

A Year of Promise
A Year of Opportunity
Put Your House in Order!

AMERICAN metal working industries are promised a year of sound prosperity.

Business once again rides on an even keel.

Let us, one and all, steer our business craft into wider markets "full steam ahead!"

Let every metal working plant replace old equipment with new—wisely but fearlessly—in preparation for a long period of steadily-improving business!

Let old methods of cleaning metal surfaces give way to the modern, the better, way—**"Flint Shotting"**—the most advanced method of sand-blasting.

"Preparedness for Prosperity"
is a mighty fine watchword for '23.

We have prepared
We are prepared

Betterments in our plant have nearly **doubled** our capacity for producing Flint Shot Sand Blast Abrasive.

Send in your orders and we'll take care of you

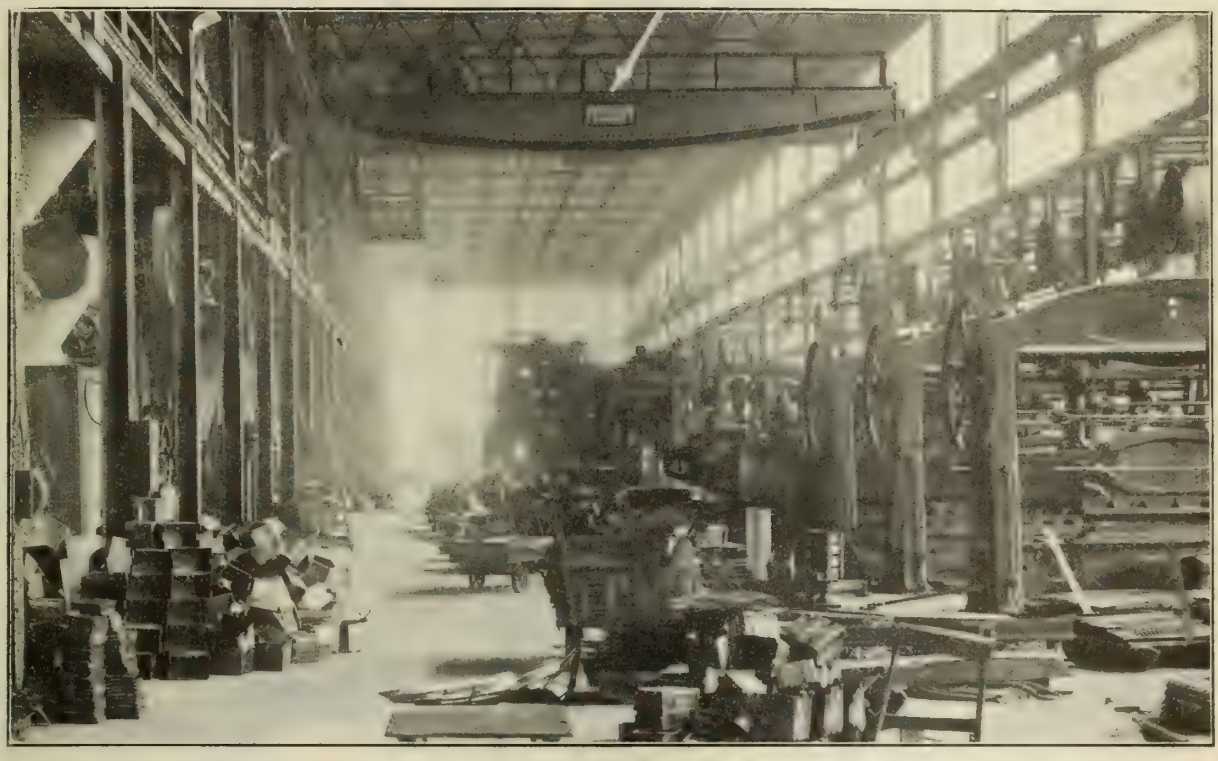
NORTHERN CRANES

NORTHERN CRANE WORKS LIMITED
WALKERVILLE, ONTARIO

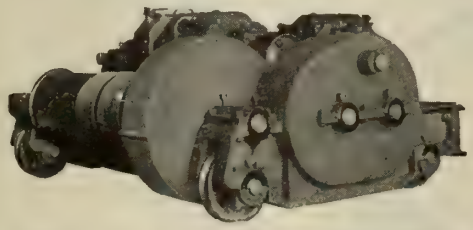


A Northern Crane at the Works of The Pedlar People, Oshawa, Ont.

Why Buy Imported Cranes?

For many years we have been meeting the definite requirements of Canadian manufacturers in the manufacture of reliable Cranes and Hoists for all purposes. ½ to 150 tons capacity.
Our Modern Crane plant at Walkerville can take care of your needs.

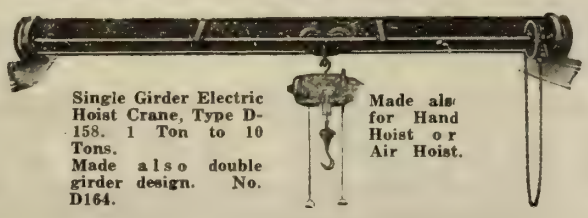
Type D. Electric Hoists —¼ to 10 Tons.



Northern Type E. Crane Trolley, Rigid, Enclosed Construction. Patented in Canada. All gears enclosed, and non-overhung. Used on our standard traveling cranes.

Northern Cranes are designed and made by men of long experience and are modern in every detail. Our line includes:

Electric and Hand Cranes, Electric Hoists, Air Hoists, and Foundry Equipment of all kinds—all "Canadian Made."



Single Girder Electric Hoist Crane, Type D-158. 1 Ton to 10 Tons. Made also double girder design. No. D164.

Made also for Hand Hoist or Air Hoist.

THE PYROMETER

From the Standpoint of The User*

"A pyrometer system arranged so that couples can be made up at the plant is probably more economical in operation than the one in which the couples can be purchased, must be purchased, completely assembled. The different parts, including the time of the operator to make up and check the new couples, do not cost nearly as much as new couples—and new couples must be checked also. The 'heads' can be used repeatedly and then, again, the couples can be shortened a few inches when the ends become burned off."

**From Trans. of Am. Soc'y for Steel Treating, August 1921. From Canadian Machinery, Vol. XXVIII, No. 16, October 1922.*

WHEN Mr. Armitage wrote the above he probably was thinking about Hoskins Chromel-Alumel couple alloys. We asked him his opinion about their accuracy and durability and he said: "Certainly the Chromel-Alumel Couple is accurate or we would not use it. As for durability, I personally think that the Chromel-Alumel couple will stand up in hard service longer than any other base metal couple that I have used."

Your pyrometer equipment also would be cheaper to maintain if you used Chromel-Alumel couples. Install Hoskins Pyrometers and get all the advantages of these alloys. Then you can make your own couples at any length, at any time, whenever you need them. Send for Catalog 31 to-day.

HIRAM WALKER & SONS METAL PRODUCTS, Limited

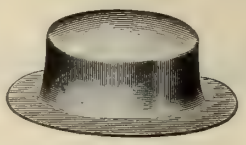
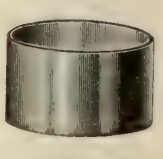
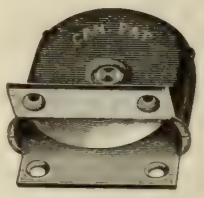
Tools and Stampings







Consider This Advice:

It is often good practice to change castings to stampings. Stampings are lighter, stronger and easier to finish — they are more profitable.

Send us your blueprints or sample of parts. We will then let you know if it would be to your advantage to make a change. Reliable advice given promptly.

We not only make Sheet Metal Stampings, but Dies and Tools for completing such work.

How may we serve you?

Your Ideal of Service Is Our Everyday Practice

THE service which you would consider ideal is prompt shipments to satisfy steady consumption and ample stock to take care of larger quantities demanded by emergencies.

This is the service Dominion Oxygen Company Limited offers to you for your oxygen and dissolved acetylene supply—plus:

A contract based on generous terms and friendly relations.
The latest type of cylinders, safe, light in weight and strong.
A liberal policy of cylinder loans.
A desire to meet your requirements.
Oxygen and dissolved acetylene of a higher standard of purity than is usual for commercial use.

We will appreciate an opportunity of placing our proposition before you and quoting prices, whether for small or large quantities, before you make arrangements for the year's supply.

A WINNING COMBINATION

VOORHEES RUB-STEEL VALVES

"The valve with a backbone"

A 4-inch valve under 100 pounds pressure has to support a load of over half a ton. Ordinary rubber valves under these conditions will crush out of shape and squeeze down between the bridges of the seat in a short time, even under the most favorable conditions and if made of the very best materials.

The steel center of RUB-STEEL Valves totally eliminates this difficulty. It provides a rigid and true surface support for the rubber envelope, insuring a dead tight joint under the highest pressure and it will retain its shape until it is worn out. Extremely light, exceptionally thin, and offers a minimum resistance to the fluid flow.

They will set a new standard for your pump performance.

VOORHEES RUBBER MFG. CO. *Jersey City, New Jersey*

CANADIAN AGENTS: CANADIAN FAIRBANKS-MORSE CO., LTD.

EVERY INDUSTRIAL PLANT MILL
and Factory must have PACKINGS

Rod and Sheet Packings are vital to every engine room, and the successful operation of all plants rests very materially on the quality of packing used. P.P.P. and EBONITE have long been recognized by engineers everywhere as the most economical and satisfactory packings on the market.

P. P. P.
ROD PACKING

Unequalled for the packing against steam, water, air, ammonia and other fluids. To meet the various conditions where rod packings are used, P.P.P. is made in Regular Form for pressures under 100 lbs., Special Form for pressures 100 lbs. and over, and Marine Form when superheated or dry steam is used.

EBONITE
SHEET PACKING

Used exclusively in many of the largest power houses, factories and machine shops, for high pressures, superheated steam, hot water, ammonia, oils, acids and all other kinds of joints requiring packing.

To secure best results in your Engine Room insist on P.P.P. and EBONITE.

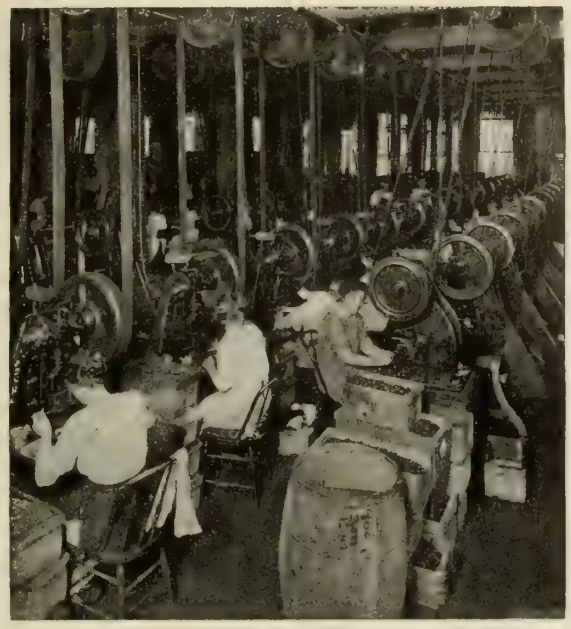
A Better Product at a Lower Cost —

The result of Bliss Presses in making Electric Fixtures



THIS BATTERY of BLISS Presses shown above means only one thing—that BLISS equipment has unquestionably earned its position as a primary production factor in this shop.

These BLISS Presses turn out electric light fixtures by the thousand, all accurate, uniform, interchangeable, and perfectly formed—at a cost far lower than by any other method.

Look over *your* list of sheet metal operations. You may consider that they are being done as economically as possible, but it's worth while consulting us to make sure.

BUSINESS ON THE

Business is coming back—not with any great momentum but a gradual improvement is evident. Inquiries are more numerous than for some time past which indicates a general revival in trade conditions.

If others are finding a need for more new equipment no doubt you will share in the coming activity. If so, we would ask you to bear in mind that we are prepared to serve you as heretofore and to furnish you with such machine tool requirements as may be called for.

C.M.C. Machine Tools are of the most modern design constructed from the highest grade material by skilled workmen. The three essentials that have made them the Standard of Quality.

We manufacture: ENGINE LATHES, GAP LATHES, BREAK LATHES, EXTENSION BED LATHES, RADIAL DRILLS, PLANERS, CRANK SHAPERS, TRAVERSING HEADSHAPERS, SLOTTERS, PUNCHES AND SHEARS.

If interested we would be pleased to send you one of our catalogs or furnish you with information on any machine in particular.

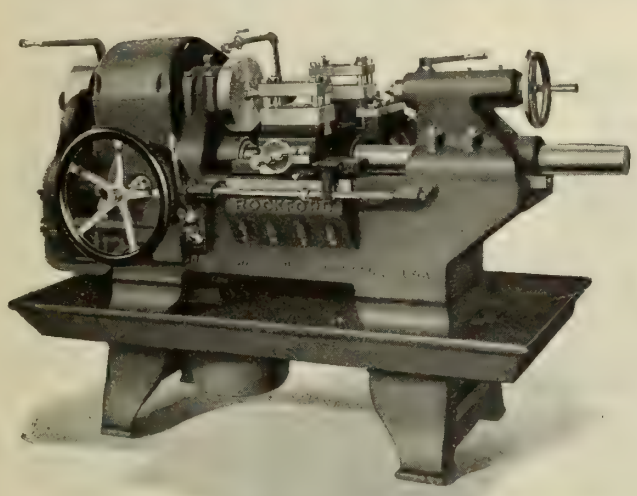
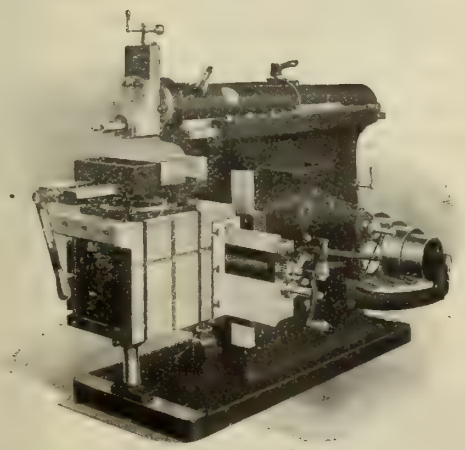
ROCKFORD
AUTOMATIC LATHE



No matter how efficient your plans there is a point beyond which out-of-date equipment cannot go. The only way to insure the highest production and the lowest cost is to pick machine tools which will give you the utmost return from your investment.

The ROCKFORD Automatic lathe has the weight massed in the important places thereby giving necessary rigidity that must back up multiple tools turning and facing steel forgings or iron castings. It provides an even steady drive to the front and rear tools, absorbing vibration under the heaviest cuts. An anchored support directly below rear cutting tools. The headstock is all helical gear drive, running in a bath of oil. Heat treated speed gears. Lathe accommodates work 18″ between centers, and has a swing of 14″ over carriage bar and 10½″ over cross carriage. Net weight 4,000 lbs. Conservative production estimates given upon request.

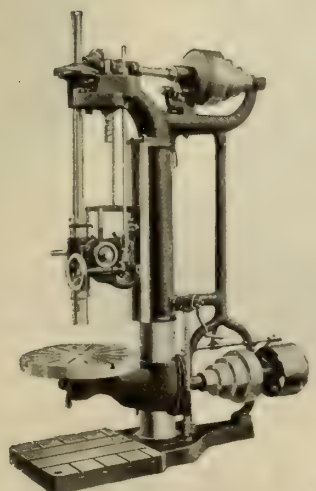


24″ Back Geared Shaper

OTHER ROCKFORD PRODUCTS

ROCKFORD PLANERS are heavy, powerful tools specially designed and constructed to meet the severe conditions which the extensive use of high speed steel has created. They are designed for rigidity, durability, convenience of operation and adaptability for all classes of work. It will pay you to investigate the many features of this planer.

ROCKFORD SHAPERS. If you are looking for a machine which is always on the job and equal to anything you wish to do, investigate the Rockford Shaper. It is powerful, rigid, accurate and convenient to handle and has a range of cutting speeds and feeds that adapt it to all classes of work.



32″ Sliding Head Drill

ROCKFORD "MECHANICS' " DRILLS. The efficiency of these drills is best appreciated by their many users. Sizes range from 14″ to 36″ and all sizes are provided with adjustment for taking up wear on spindle sleeve; have four step cone pulleys; improved enclosed back gears and a correctly cut crown gear and pinion. Positive geared feeds are instantly available and can be changed while machine is running.

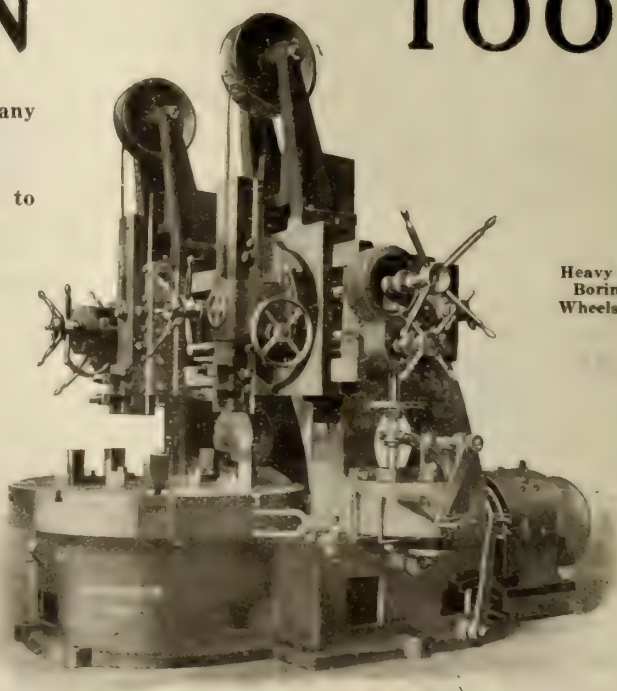
SLOTTING MACHINES, 12 in. to 60 in. stroke.

SHEARING MACHINES up to the largest sizes of Plates, Blooms, or Bars.

BORING MACHINES, all sizes.

TESTING MACHINES, for Tension, Compression, Deflection, Torsion, and Shearing Tests.



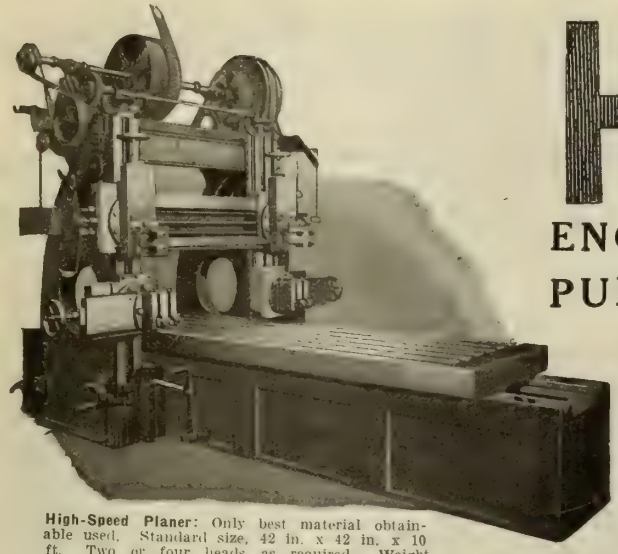
Heavy Turning and Boring Mill for Wheels and Tyres.

Special Machine Tools For Turbine Locomotive and Marine Engine Builders Steel Works and Forges

Joshua Buckton & Co., Ltd., Well House Foundry, Leeds, England

ESTABLISHED 1843. INCORPORATED 1886

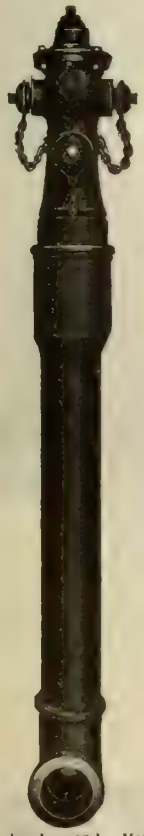
Cable Address—"BUCKTONS, LEEDS." Codes:—A.B.C., 4th & 5th Edition. A. 1, New Business, Bentley's Complete Phrase.



High-Speed Planer: Only best material obtainable used. Standard size, 42 in. x 42 in. x 10 ft. Two or four heads as required. Weight 22,000 lbs.

HEPBURN

ENGINES—PLANERS—PRESSES PUMPS—CRANES—DERRICKS WINCHES—CUT GEARS—SPINNING LATHES—GREY IRON CASTINGS—VALVES—HYDRANTS—Etc.



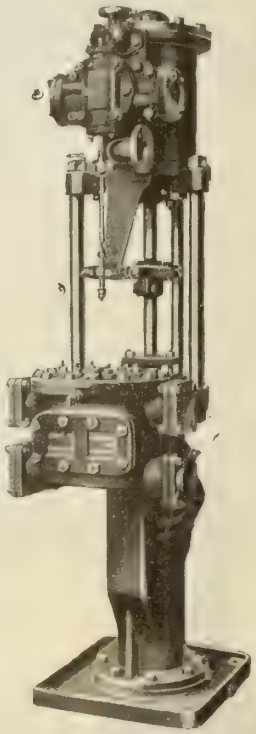
Hydrants and Valves: built to specification

These are but a few products of the HEPBURN shops.

A powerfully constructed POWER PRESS designed for long and hard service. Cranks are made from solid forgings. Long strokes. Exceptionally good finish.

Up-to-the-minute in design, made of carefully selected material and built by workmen who are experts in their line, Hepburn products are appreciated throughout Canada for their top-notch quality and reliability even under adverse circumstances. Tell us your requirements and we will send you some interesting particulars.

Hepburn Centrifugal Pumps for all services. They are of the most modern design and embody many excellent features.



Hepburn Special Vertical Ram Feed Pump: A high pressure type with only one gland to require packing. Operates with positive Lever Valve Motion. Minimum floor space required.

HEPBURN SCOTCH DERRICKS

For Hand and Power, from 1-2 Ton to 8 Ton capacity

JOHN T. HEPBURN, LTD.

Engineers and Iron Founders

Dickow's NEW IMPROVED Index Centres

The Highest Degree of Accuracy Guaranteed in Every Respect

In our many years of experience and specializing on Index Centres, we have developed many special machines, fixtures and testing tools for making Index Centres with the highest degree of accuracy obtainable.

The Index Centres are Dickow's original design, which were designed for heavy and very accurate milling, simple in construction, convenient and durable.

Some of our Accuracy Tests of this 10-Inch Universal

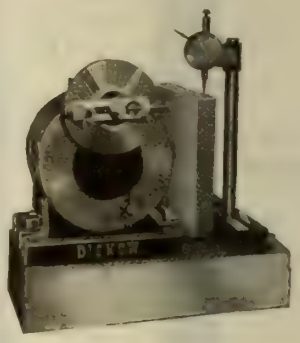

Fig. 4

Figure 4 shows the method used in testing the accuracy of the worm gear in every tooth, by which we are able to get a very accurate test of every tooth, and the accumulative error reading to .0001. The accumulative error allowed in spacing of the entire circumference of the worm gear is .0005; the average is .00025.

Fig. 5

Figure 5 shows the testing of tail stock center parallel alignment with sides of tail stock block; error allowed, .0002.

Figure 6 shows testing of spindle alignment with base, spindle alignment with T slot. Spindle alignment with base error allowed .00025, using 16 inch test bar. Spindle alignment with T slot error allowed .00075, using 16 inch test bar. Spindle test error allowed .0005 at the end of 16 inch test bar. The average ones are perfect.

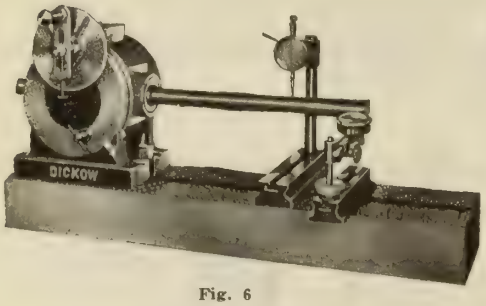

Fig. 6

Figure 7 shows testing of alignments of tail stock centre with head centre, using 12 inch test bar. Error allowed, .0005; most are perfect.

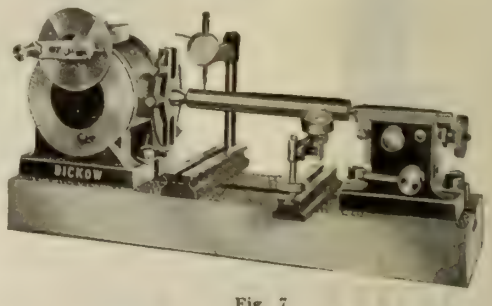

Fig. 7

DEALERS NOTE—Dickow's New Improved Ten Inch Universal Index Centres have been reduced to rock-bottom price. Dealers guaranteed against any further decline for a period of six months.

Types of "Illinois" Formed Cutters

MANUFACTURED IN CANADA

Illustrated above are some of the various types of formed cutters we manufacture. Materials and workmanship are of the very highest grade and every cutter is absolutely guaranteed to be accurate and thoroughly dependable in every respect. No matter what types of cutters you need, we have the facilities and the experience to produce just exactly what you require.

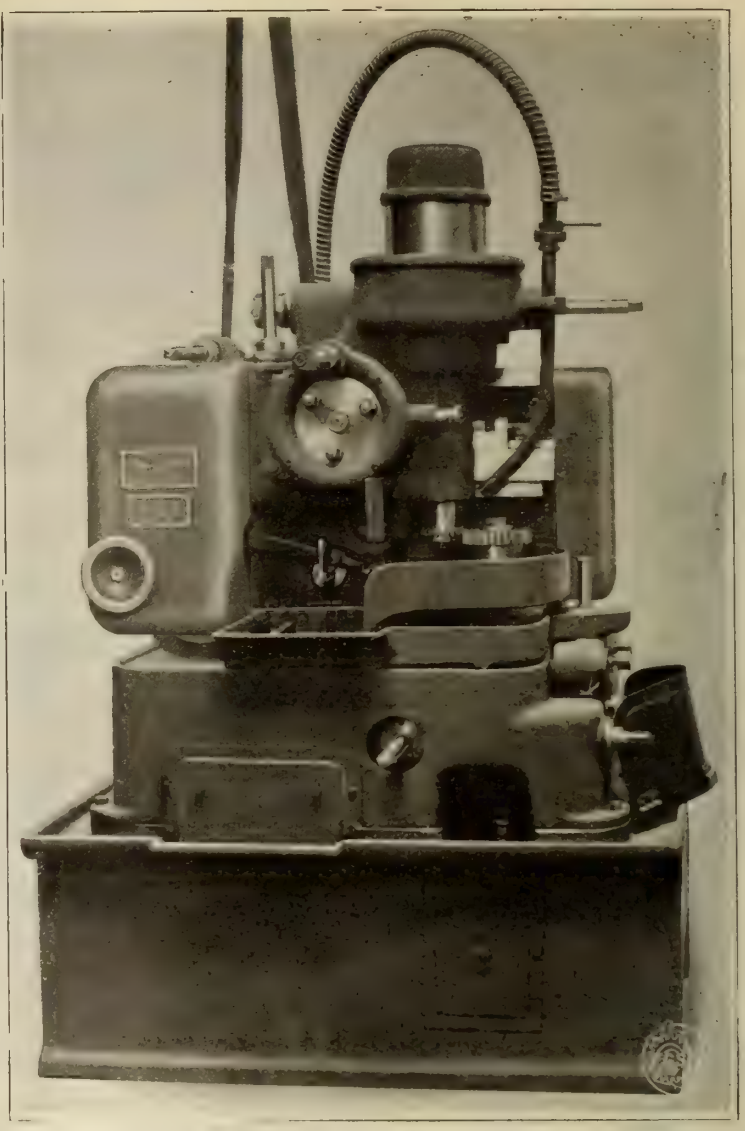
What Users of The New High-Speed Gear Shaper are Saying—

"Just the Machine I have been Looking for."



The New High-Speed Gear Shaper—the Machine You Are Looking For

When this Works Manager was asked to express his opinion on the new High-Speed Gear Shaper, he used the words quoted.

He went on further to say that this machine had cut their costs on various parts, the savings resulting in some cases being beyond his wildest expectations.

The first machine has been followed by a battery of ten machines.

It is results that count.

Write for catalog describing this machine.

It gives you the Actual Elapsed Time any Job has required

The International Elapsed Time Recorder prints the time a job is started. When the job is finished it prints the time again—and then it also computes and prints the ACTUAL TIME spent on the job.

See what that means? You get a machine that cannot make mistakes, that PRINTS in unchangeable figures the time any job or process has taken.

No illegible or erasible lead pencil records. No guess work or mistakes in figuring elapsed time. No forcing of a time balance. The printing is in plain clear figures—not symbols.

For day work, it gives the correct basis for the labor charge and the proper burden rate. For piece-work it gives a close check on pay rates and a basis for changing the rates when necessary.

A wonderful machine. Write for complete details.

Read the figures on the partial shop order card above.

INTERNATIONAL BUSINESS MACHINES CO., Limited

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

VOL. NO. XXVIII No. 26 DECEMBER 28, 1922

Opportunity — Responsibility

IT HAS been stated that the difference between opportunity and responsibility is that the latter is aggressive and always present, while the former is passive and on best terms with those who invite its acquaintance. Recognition of the one, however, leads with confidence and courage, to development of the other.

Canada, as a nation, is assuming increasingly important world position. Rich endowment in a nation, as in an individual, should be a relative condition, finding its best expression in breadth of contact. It entails an interpretive vision and its proper development requires untiring industry, and a poise that will correctly reflect national status and aspiration.

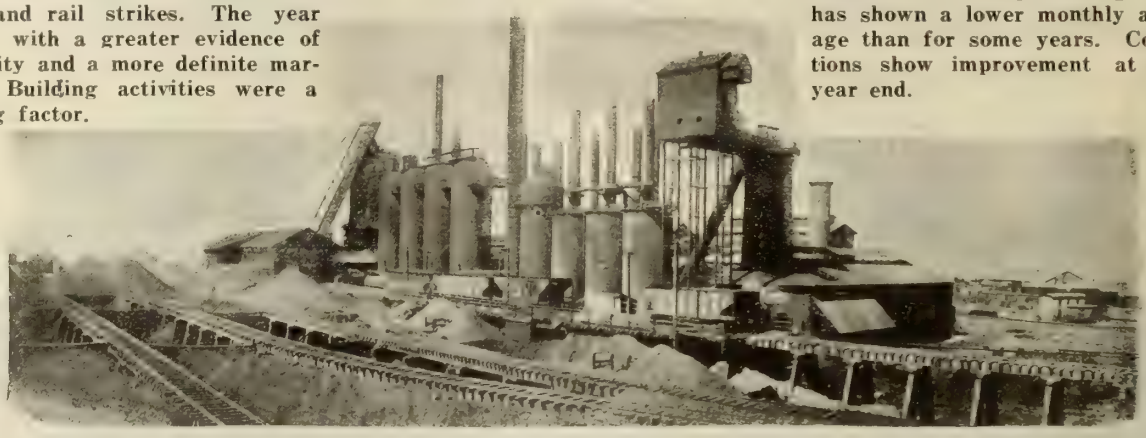
Canadian industry is on the threshold of another year. Looking backward, the fact that stands out is that the past twelve-month has demanded, in many instances, the most of courage and the best of every resource. In the iron and steel and machinery industries, results have not been lacking, although production and sales have not been altogether comparable with some records in recent years. These, for the most part, had behind them the impetus created by unusual circumstance. The task of the present has to do with normal growth. Much that has a relative bearing is a trifle out of tune, but there must be a response to well applied effort.

Though imbued with immense responsibility, the new year will be richly endowed with opportunity. An attitude that brings the two into proper alignment is necessary to an optimistic outlook. May the year warrant the fullest confidence, and brings a full measure of prosperity.

Progress in Steel Industry

Pig iron and steel prices during 1922 were influenced upward by coal and rail strikes. The year closes with a greater evidence of stability and a more definite market. Building activities were a strong factor.

Typical Blast Furnace



Total production of pig iron, steel ingots and castings during 1922 has shown a lower monthly average than for some years. Conditions show improvement at the year end.

Iron and Steel Strong Base for Industrial Growth

Year Closes With Reason for Optimism Because of Industry's Past Record—Inspiration From 1920—All Divisions Made Great Showing—Outlook Encouraging—Some Interesting Comparisons

HOW CLOSELY iron and steel are associated with the great industrial fabric of the country, and the extent to which they contribute to general prosperity, may best be ascertained by a review of their different divisions. When it is stated that the maximum year from the viewpoint of production was 1918, with a total value of $789,000,000, the significance of the fact is affected in that these figures represented abnormal war conditions. However, it did set a new record for the country's capacity production. Then came 1919, notable because it brought with it what was referred to as a "relaxation of the sinews of war," or a reduction in values of $300,000,000.

In 1920, regarded as the banner year — one worthy of the industrial aspirations of 1923 — the country devoted itself to rehabilitation, iron and steel production again reached a level of $640,000,000. It was in this year that work in car shops reached a value of $75,000,000, a figure which indicates what this field of activity must mean to business in general. Toward the end of 1920 a depression set in which continued during 1921 and well into 1922, for many of the divisions making up the whole. The three years referred to from what has been called the "return-to-normalcy cycle," made up of, first, a sharp break, then a strong recovery and finally a decline to very low levels in production with high cost averages. The end of 1922 brings every indication that the chart will reveal steadily climbing tendencies.

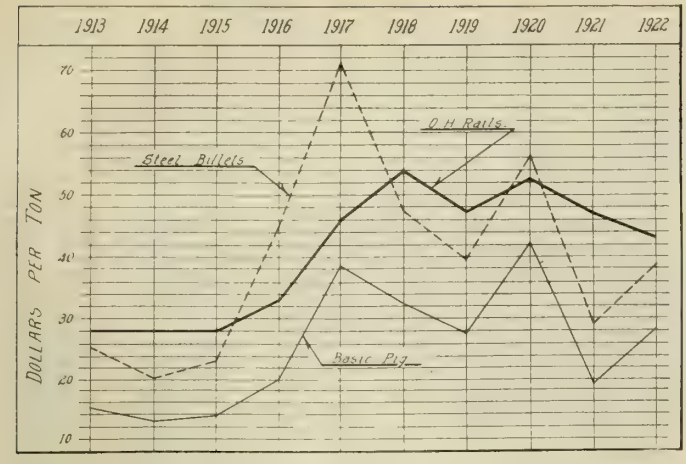
How have wage-earners been effected in the period under review? Employment statistics show the number engaged in iron and steel in 1918 to have averaged 128,125; in 1919, this declined to 88,300; 1920 saw an increase to 102,661. Taking 100 as a base, 1920 averaged 104 per cent.; 1921 declined to 76.6, while the first four months of 1922 saw an index of 68.1 with a minimum of 64.5 in January. There has been steady improvement in employment during the year. Of the amount paid in wages and salaries in 1920, a total of $158,504,947, the wage-earners received 83.8 per cent.

An interesting fact is revealed by official statistics in that the year 1870 is credited with 4,000 establishments in the iron and steel series. This, of course, included a large number of very small shops. The total number employed was 27,666; the wages amounted to $5,119,414, and the value of products, $28,158,189. Compare this with 1920, confining the compilation to 1,475 establishments, the average number of wage earners was 102,661; wages, $132,885,132, and products valued at $640,233,785, or practically thirty times greater than the record of fifty years ago, although the number of wage earners employed was hardly five times as great. Every period has its standards of industrial production, and there is here an interesting commentary upon the development that has taken place in machine tools and equipment for facilitating business.

Machinery Production Develops

Of the iron and steel commodities produced in Canada, the figures pertaining to 1920 are particularly interesting. This year, let it be understood, is regarded as a standard representing industry on the whole as functioning at its best. Production of machinery by, and to serve, important industries was valued as follows:

Autos, passenger No. 83,974	$80,558,204
Autos, freight, No. 10,174	8,153,517
Bicycles, No. 34,418	1,484,833
Railway cars, No. 5,174	21,947,175
Car and locomotive repairs performed by entire car and repair works	85,903,830
Pig iron production, net tons $1,000,396, value	27,912,147
Castings, net tons, $67,285, value	12,918,000
Blooms, billets, slabs, net tons 737,720, value	15,781,687
Pulp and paper	4,739,763
Mining and engineering	1,191,336
Saw and shingle mill	1,175,031
Special	1,948,258
Transmission	1,542,466
Woodworking	1,305,896
Sewing machines, No. 72,949	2,553,072
Scales, No. 22,489	1,739,468
Elevators, No. 542	1,101,979



Price trend on steel billets, open hearth rails and basic pig iron for period 1913—1922.

Price trend on galvanized sheets, tank plates, and steel bars during period 1913—1922.

Value of imports of iron and its products from 1917 to 1921 averaged $16,861,596, while the first six months of 1922 was 67.65 of the five-year average. The highest import value during the present year was in May when it reached $12,803,074.

According to compilations by the Employment Service of Canada, the average monthly employment in 1920 was indexed at 104 per cent. In 1920 this fell to 76.6, while the monthly average for the first six months of 1922 was 68.1 per cent. There was an increase in employees engaged in May over those of January, the former being 109,329, with 734 firms, and the latter 100,294, with 700 firms.

In the metal and engineering group the aggregate duration in man days of all strikes and lockouts averaged as follows: 1918, 10,571 days; 1919, 52,442 days; 1920, 29,108 days; 1921, 5,471 days; average four years, 24,398 days; Jan., 1922, 4,357 days.

Primary power employed by the iron and steel trade in 1920, according to Dominion Bureau of Statistics, was 266,454 horse power. Rented electric power was 55.4 per cent. of total elementary power. Capacity of operating plants was 28,864 units with a rating of 301,265 horse power. Boiler capacity of operating plants was 773 units, with a rating of 125,285 boiler horse power. Power actually used during the year was 98,615 horse power. Blast furnaces and steel mills, with an equipment of 249 boilers, rated at 60,036 horse power, led all other groups in this respect. The foundry and machine shop group came second with 126 boilers rated at 10,369 horse power. Fuel requirements of iron and steel trades amounted to 1,386,032 tons of bituminous, valued at $9,753,156. This was 53.2 per cent. of the total fuel cost. The chief remaining items listed in order of value were fuel oil, 20.2 per cent., coke, 12.5 per cent. and hard coal 6.1 per cent.

Total capital employed in foundries and machine shops amounted to $68,346,628 for 581 plants; boilers and engines, $32,662,552 for 55 plants; machinery, $52,066,936 for 156 plants; agricultural implements, $110,868,713 for 99 plants, and hardware and tools, $32,798,513 for 152 plants. The cost of materials entering into the operations of all plants engaged in iron and steel and products in 1920 was $321,298,396; value of products was $640,233,785.

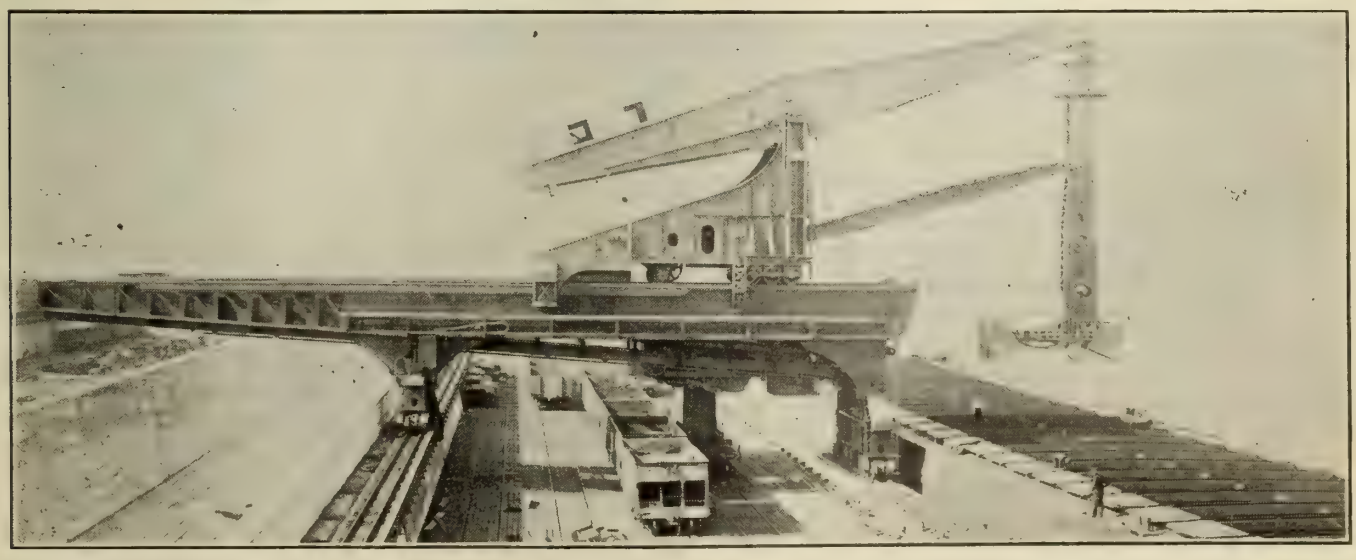
Leading Position of Ontario

Ontario leads other provinces in the manufacture of iron and its products. Of the total amount of $642,904,322, 65.9 per cent. was invested in Ontario, while 61.8 per cent. of unemployment and 66.3 per cent. of production is credited to the same source. Quebec, second, represented 20.5 per cent. of capital invested.

* * * *

BLAST FURNACES AND STEEL MILLS SHOW HIGH RECORD OF AVERAGE

PIG IRON and ferro-alloy plants in 1920 numbered 9; steel furnace plants, 17; rolling mills, 18; combined steel mills, 6. The average monthly output of pig iron and ferro-alloys in 1920, reported as 90,866 net tons, was 118.8 per cent. of monthly production of 1919; 163.8 per cent. of the record for 1921 and 25.3 per cent. of average monthly output of first four months of the present year. The monthly output of steel ingots and castings in 1920, given as 102,725 net tons, was 119.6 per cent. of the monthly production in 1919; 164.8 per



Conveyor bridge and unloader such as used in removing ore from the holds of lake freighters. Some such equipment as this is proposed for the Canadian Steel Corporation at Ojibway.

cent. of that for 1921 and 322.8 per cent. of average monthly output during the first four months of 1922. The average annual and monthly production of iron and steel in Canada from 1913 to 1922 is as follows:

	1913	1917	1918	1919	1920	1921	1922
Iron Products	1,128,967	1,170,480	1,195,551	917,781	1,091,396	665,676	
Monthly Average	94,081	97,540	99,629	76,482	90,865	55,473	35,914
Steel Products							
Monthly Average	97,416	145,178	156,142	85,862	102,725	62,296	31,810

Imports to Canada of iron ore from United States:

	1920	1921
Quantity	1,300,647 tons	514,651 tons
Value	$4,866,644	$1,885,494

From Newfoundland:

	1920	1921
Quantity	616,287 tons	139,394 tons
Value	$861,432	$184,851

Imports of various iron and steel products from United States into Canada, 1913-1921:

	Short tons	Value	Value per ton
Sheets and Plates			
1913	356,344	$12,364,721	$34.70
1921	180,428	11,950,255	66.28
Steel Rails for Railways			
1913	18,408	4,791,559	26.41
1921	25,796	1,057,752	41.00
Billets, Ingots and Blooms			
1913	45,568	964,373	21.16
1921	8,079	264,386	32.73

Interesting Comparison

The output of foundries and machine shops in 1920 was valued at $76,766,903, of which $23,972,550 or 31.2 per cent. was the production of combined machine shops and foundries, and $21,997,839 or 28.7 per cent. was the output of plants engaged in production of iron pipe and fittings. There were, on an average, 161,345 wage earners employed. The year opened with a payroll of 15,786, increased to 16,803 by April and in December this had decreased to 15,007.

An interesting comparison as between 1870 and 1919 in foundry development is shown in the fact that in 1870, the plants numbered 430, while by 1919 this had increased to 731; 7,653 wage earners in 1870 increased to 21,680 in 1919. Value of products in 1870 was $7,325,531, while in 1919 the amount was $81,710,215. Cost of materials in 1870 was $2,477,423; 1919 it amounted to $26,301,761.

Import and Export Items

Large import items of foundry and machine shop products in 1920 and 1921 were the following:

	1920	1921
Seamless steel or wrought iron boiler tubes, including flues and corrugated tubes for marine boilers	$2,591,452	$807,364
Seamless steel tubing, valued at not less than 3½ cents per lb.	480,517	100,424
Wrought or seamless tubing, 4 in. or less in diameter	460,903	344,698
Wrought or seamless tubing not over 10 in. in diameter	642,270	217,651
Screws, nuts, rivets and bolts	614,309	305,291
Axles and axle parts	3,190,403	1,474,450
Fittings of iron and steel	1,082,655	683,954
Chains	1,294,736	684,370
Fittings, iron or steel for iron or steel pipe of every description	1,082,655	683,954
Springs	622,305	263,668
Valves, iron and steel	868,109	609,210
Brass valves	562,153	186,036

Financial summary of the foundry and machine shop group, 1920.

Total capital employed	$68,346,128
Salaries and wages	24,941,887
Cost of fuel	2,967,121
Cost of Material	52,603,268
Miscellaneous expenses	8,310,814
Total expenditure	68,823,090
Value of products	76,766,903

Exports from Canada of the principal foundry and machine shop products, 1920-1921:

	Canadian Products		Foreign products re-exported	
	1920	1921	1920	1921
Castings	$ 895,650	$ 289,968	$ 32,070	$23,278
Forgings	1,108,980	43,061	207,427	1,721
Bolts and nuts	265,970	164,387	26,127	2,483
Brass valves	325,974	156,804	2,167	4,797
Tubing and pipe	2,614,154	2,019,860	53,609	22,331

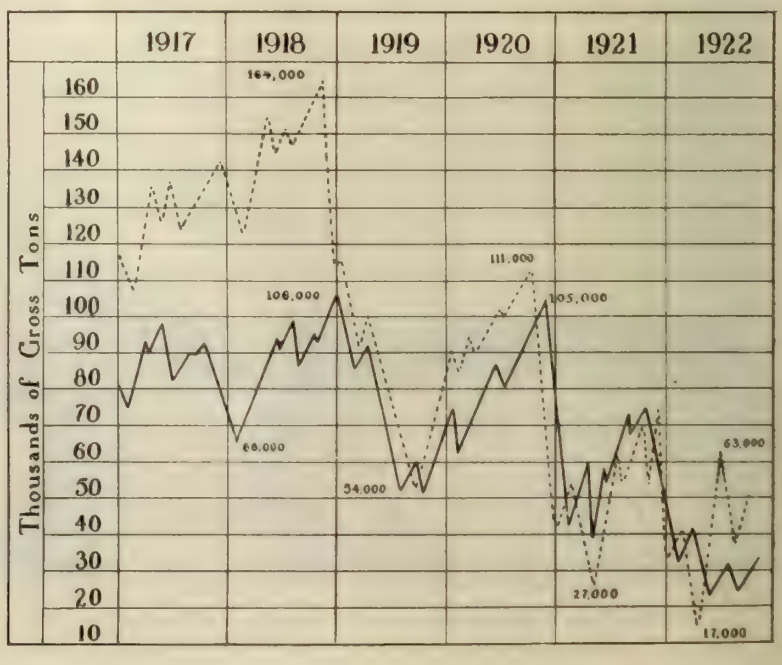
Fabrication of Iron and Steel

This group includes metal furniture, safes, railway track equipment, architectural and structural iron and steel.

Fifty plants in 1920 produced goods to the value of $14,318,685, of which $8,030,218 was the value added by the manufacturer. The 19 establishments fabricating structural iron and steel had a production of $5,897,467. The average monthly payroll carried 2,511 wage earners, as compared with a minimum employment of 2,341 in December and a maximum of 2,627 in August.

Financial summary of iron and steel fabrication group, 1920.

A study of pig iron and steel production in Canada during the past six years. The record for 1922 reached unusually low levels but an upturn is in evidence. Steel Company of Canada will start the year 1923 by blowing in their second furnace; Algoma Steel Corporation, it is reported, are preparing for greater activities, after running one furnace only for some months; and the British Empire Steel Corporation are also equipped for larger output. Foundries report that business is improving. Radiator plants have ordered large tonnages of pig iron recently, and it is evident that the building industry is to continue active the coming year. Pig iron markets are showing more strength than for some months.



Number of establishments	55
Capital	$12,355,869
Salaries and wages	4,101,094
Cost of fuel	116,562
Cost of materials	2,216,846
Miscellaneous expenses	2,216,846
Total expenditure	12,722,969
Value of products	14,318,685

ENGINE SHOPS HAD HIGH AVERAGE

OF THE production in this group during 1920, valued at $22,614,951, the boiler and tank industry contributed $5,265,913, or 23.3 per cent. Products of the engine and locomotive industry were valued at $17,349,038 or 76.7 per cent. of the output of the group. Average employment was 4,660, and the amount paid in wages was $5,904,352.

Financial Summary of Boiler and Engine Group

Establishments	55
Capital	$32,662,552
Salaries and wages	7,113,052
Cost of fuel	668,560
Cost of material	9,891,832
Miscellaneous expenses	2,545,829
Total Expenditure	20,219,273

AUTO IMPORTS INCREASE—PRICES DOWN

For the twelve months ended September, 1922, Canada imported iron and its products to the value of $119,297,888, as against $165,439,295 in 1921 and $237,541,838 in 1920. The amount in pigs, ingots, blooms and billets was $1,381,860, as against $3,384,855 in 1920. Rolling mill products imported for the year ending September, 1922, were valued at $26,372,403, as against $56,644,372 in 1920. Passenger autos imported for the same period were valued at $11,015,689, for 10,088 cars, as against $11,728,008 in 1920 for 8,884 cars. These figures are significant of the drop in auto prices.

Imports Curtailed in 1922

That buying in certain lines was very much curtailed this year is shown in the fact that for the year ending September, 1922, the importation of tubes, pipes and fittings amounted to $2,281,978, against $5,565,188 in 1920. Machinery imported was valued at $22,498,264, against $44,558,184 in 1920; engines and boilers were imported to the value of $5,644,117, as against $13,471,818 in 1920; farm implements imported, $7,670,605, as against $22,613,938 in 1920.

Export Trade Declined

Canada exported, year ending September, 1922, iron and products valued at $35,647,293; against $82,742,384 in 1920. Notable items were: Farm implements, 1922, $4,590,332; 1920, $11,715,339. Hardware and cutlery, $1,240,730; 1920, $9,041,919. Passenger autos, 1922, $15,370,858 for 26,909 cars; 1920, $14,674,190 for 21,286 cars. Pigs, ingots, blooms and billets, 1922, $1,184,279; 1920, $8,994,613. Iron ore 1922, $1,013,283 for 105,643 tons; 1920, $5,723,828 for 435,540 tons. Gold ore exported year ending September, 1922, was $3,542,908, against $4,816,041 in 1920; scrap metal, 1922, $1,025,184 for 94,286 tons; 1920, $3,320,070 for 185,058 tons; rails, $511,395 for 17,093 tons in 1922, against $2,544,263 for 59,232 tons; machinery, $2,106,176, against $6,326,547 in 1920.

MANY PLANTS BUILDING MACHINES

THIS GROUP includes establishments engaged in manufacture of machinery. Thirteen plants were employed in the making of household machinery, including sewing machines, washing machines and wringers; 21 were employed in production of business machinery, including typewriters, computing machines and scales, and 122 firms were engaged in building industrial machinery and elevators.

Total production of $40,535,474 in 1920 was divided as follows: Sewing machines, 7.2 per cent.; washing machines and wringers, 5.2 per cent.; office machinery, 14.2 per cent.; scales, 3.8 per cent.; industrial machinery, 65.1 per cent., and elevators 4.5 per cent. The cost of materials was $13,605,268, leaving a value added by manufacturers of $26,930,206. The net output computed in a similar way for the industrial machinery industry was $17,741,194. The value of production for the industry was $26,380,284, while the cost of materials was $8,639,000.

The maximum employment for the year was in May, when 9,842 wage earners were engaged. The year opened with a payroll of 9,006 and noteworthy increases were recorded until May. A declining trend set in until the end of the year when 8,822 wage earners were reported. During 1921 the industry confronted a steady uphill climb. There was little improvement in the forepart of 1922, but the end of the year shows an improvement of from 40 to 50 per cent. over January of this year.

Notable among the imports for 1921 were the following:

Steam shovels and electric shovels	$ 332,697
Mining and metallurgical machinery	1,488,386
Typecasting and typesetting machines	975,255
Other printing and bookbinding machinery	1,566,773
Air compressing machines	220,772
Coal handling machines	182,428
Power lathes (1920—$848,800)	162,249
Machine drills (1920—$1,274,993)	324,897
Paper mill machines (1920—$1,550,476)	1,993,222
Rolling mill machinery (1920—$721,044)	260,802
Saw mill machinery (1920—$310,809)	148,049
Textile machinery (1920—$5,745,802)	3,366,850
All other machinery (1920—$2,315,210)	12,385,370

Total production of principal items, 1920, amounted to $26,387,804. The following are notable:

Hoisting equipment	$ 682,762
Boring and turning machinery	111,206
Grinding	114,714
Other	890,440
Lathes	479,496
Pulp and paper machinery	4,739,765
Mining and engineering	1,101,336
Saw and shingle mill	1,175,031
Transmission	1,948,258
Woodworking, N. E. S.	1,305,896
Scales	1,739,468
Sewing machines	2,253,072
Freight elevators	1,101,385

STRENGTH OF AGRICULTURAL IMPLEMENTS

Production in the agricultural implement group in 1920 was mainly divided as follows:

Horse and power implements	$28,783,424
Hand implements and tools	1,173,130
Dairy equipment	2,421,843
Power units and machinery	3,488,451
Miscellaneous products	14,434,434
Materials used amounted to	$22,588,390

The number of employees receiving salaries and wages in 1920 was 12,838; salaries and wages amounted to $16,941,987.

* * * *

ACTIVITIES IN RAILWAY SHOPS

THE CAR group, including railway cars and parts, as well as repair shops, made progress in 1920. The value in production and repair was in excess of $135,590,000, of which the steam railway car repair shops was credited with $70,568,913 or 52 per cent. The electric car repairs were valued at $4,661,706 or 3.4 per cent. The output of 11 car works was $53,313,260. The car wheel and parts industry, comprising seven plants, produced $6,535,000 and the three firms chiefly engaged in the manufacture of brakes and brakeshoes reported a production of $511,251.

The increase in the value of repair work on steam cars over the record of 1919 was 45.1 per cent. and the production of brakes and brakeshoes industry increased by 39 per cent. The output of the car works, on the other hand, decreased by $6,649,059, or 11.08 per cent. from 1919, reported as $59,962,319.

The employment indicated that payrolls in January carried 41,254 wage earners. An improving tendency was maintained in November when the peak was reached with 46,190 wage earners. The year closed with 43,870 under employment as composed with an average of 43,305.

An improvement in this branch of the industry is confidently expected in 1923. It is claimed that the railways can no longer ignore necessities in rolling stock repairs and replacements and important activities are looked for.

* * * *

STRENGTH IN SHEET METAL INDUSTRY

IN SHEET metal products there were 122 establishments; twenty were employed in enamel ware and tinware; seven in making metal dress fasteners; ten in metallic roofing, siding and flooring, and 85 plants in other sheet metal products. Value of production was $37,369,576, of which $19,823,986 or 53 per cent. was in sheet metal products not otherwise classified; and $16,360,723 or 43.8 per cent. was the output of the enamelware and tinware plants. The value added by manufacturers in all plants was $17,108,756, of which the net output in the enamelware and tinware industry was $7,647,946, or 44.7 per cent. The net output in the metal dress fasteners industry was $225,741, or 1.5 per cent. The net production of the metal roofing, siding and flooring industry was $251,617, or 1.5 per cent. and the net output of those engaged in other sheet metal products was $8,959,452 or 52.3 per cent.

Employment increased from 6,366 wage earners in January to 6,650 in April. The decreases after July, when 6,610 were employed, were steady, excepting October when the employment of 6,374 equalled that of September. The year ended with a payroll of 5,818 as compared with 6,366, the average for the year.

* * * *

HARDWARE IMPORTS DECLINED

OF THE value of output in the hardware and tool group of $22,556,316, 27.6 per cent. was the production of edge tools and cutlery. The value added by manufacturers, obtained by deducting cost of materials from volume of products, was $15,356,314 for the group, of which 30.1 per cent. was the net output of the edge tool and cutlery industry.

Among the imports the following items are notable:

	1920	1921
Hand tools	$2,005,126	$1,025,171
Knives and forks of steel	720,932	674,643
Files and rasps	226,769	132,060
Saws	201,172	78,857
Locks of all kinds	742,287	388,267
Builders' hardware, carriage hardware, saddlers', etc.	1,071,100	706,062
Edge tools and cutlery	$6,232,128	
Tools and implements	4,496,248	
Builders' hardware	4,100,000	
Screws	2,511,710	
Saws	2,183,240	
Dies and taps	1,417,564	
Needles and pins	728,337	
Hardware N. Q. S.	717,278	
Skates	79,040	

For year ending September, 1922, hardware and cutlery importations amounted to $3,299,684, as against $5,545,331 in 1920; tools, 1922, $1,258,858; 1920, $2,581,591; clocks and watches, 1922, $1,615,478; 1920, $3,803,912; pneumatic tires, 1922, $1,145,831; 1920, $2,034,087.

Canadian exports in hardware lines in 1922 included the following: Binder twine, $566,226; 1919, $1,660,387. Paints and varnish, $456,401; 1919, $852,773. Tubing and pipe, $1,173,515; 1919, $2,674,413. Hardware and cutlery, $1,240,730; 1919, $3,364,062. Tires, pneumatic, $3,664,604; 1919, $4,067,669. Activity in this industry at end of 1922 shows steady growth, with encouraging outlook.

* * * *

PRODUCTION OF WIRE PRODUCTS

The wire group comprises wire, wire rope and nails, wire fencing, etc. Following are statistics for 1920:

Capital	$18,339,020
Salaries and wages	4,731,717
Cost of fuel	490,387
Cost of materials	14,219,338
Miscellaneous expenses	2,215,359
Total expenditure	21,056,801
Value of products	30,251,349

Experts Investigating Ontario's Ore

By HON. E. C. DRURY,
Premier of Ontario.

THE position of Canada is fortunate in many respects at the present time. We have been blessed with a good harvest. Our financial situation as compared with that of other countries is excellent, although it presents serious problems. The industrial development of Ontario is intimately associated with our mineral production. In the matter of precious metals, we have gained an enviable position. Gold production has made great strides and new discoveries and new camps are being developed. The production of silver has been well maintained, and we are also making substantial advance. The nickel and copper industry is now being revived after a temporary depression, and the mines and smelters are again in operation, although on a reduced scale.

The iron and steel industry in Ontario has been hampered in the past by the fact that we are almost entirely dependent upon imported ore. We realize fully that if we were able to use ore from Ontario mines more extensively it would be of great advantage to this industry. There are extensive low-grade iron deposits in Ontario, and at the present time a committee of experts is investigating the problem of the utilization of these ores in the manufacture of pig iron and steel.

The extension of the Temiskaming and Northern Ontario Railway may have an important bearing on the iron industry. The Legislature has authorized the construction of the railway through to James Bay. Contracts have been entered into which will carry the road one-half the distance in the next two years, and when this has been done we will probably be in a position to complete the undertaking.

Eventually, we may look for the discovery and the development of important iron deposits in the North. I feel that in this and in other ways the Province is building well for the future.

"Besco" Operates Modern Wire Products Plant

Many Problems Confronted British Empire Steel Co. During Year —Miners Scarce and Coal Output Down—Production Costs Up— Union Opposition—Good Demand for Certain Steel Products— Market for Wabana Ore

By F. W. GRAY, M.E.
British Empire Steel, Nova Scotia.

COMMENCEMENT of iron and steel manufacture in Cape Breton Island, now not far from twenty-five years ago, gave to the coal mining industry the stimulus to which is traceable most of the remarkable expansion in coal outputs that culminated in 1913.

In Bulletin 14 of the Mines Branch at Ottawa, written in 1916, the writer showed that coal production in Nova Scotia had increased in the period between 1830 and 1910 in a geometrical progression of 78 per cent. per decade, and stated: "The war which commenced in 1914, and the resultant dis- "organization, first of trade conditions, and afterwards of the "labor supply by reason of the needs of the army, has caused a "lessened rate of production that will in all probability persist "over several years to come." ....."it seems probable, for "many reasons, that the large output of 1913 will not again "be materially exceeded within the current decade, and that "for several years to come at least, the coal production of "Nova Scotia will not be greater than seven million tons per "annum."

The following table of annual outputs in Nova Scotia will show serious recession in coal production since 1913:

	Gross Tons (Estimated)		Gross Tons (Estimated)
1913	7,263,485	1918	5,211,000
1914	6,650,031	1919	5,160,000
1915	6,709,951	1920	5,800,000
1916	6,171,434	1921	5,100,000
1917	5,665,477	1922	4,700,000

In the period 1914 to 1918 inclusive the decline in production was caused by army enlistments, and the outputs attained represented the maximum capacity of the workmen at the collieries. Since the conclusion of the war the decline in production is the combined result of shortage of skilled miners and the prostrated state of the steel industry.

Production Down

The production for the year 1922 promises to be the smallest since 1902, which last-named year was about the date when the consumption of coal in steel-making commenced to exert a decided effect on coal production in the province.

As compared with the year 1913 there exists at the present time a shortage of approximately 1,500 skilled faceworkers at the collieries, or, put in another way, the men who actually dig coal in the province have been reduced to two-thirds of their numbers in 1913, and it is of course inevitable that a reduction in output exactly proportionate to the reduction of coal diggers should occur.

With full-time production from the number of miners available in the province, an output of a little short of six million tons per year should come from the collieries of Nova Scotia, and the difference between this figure and the estimated quantity of 4,700,000 tons for 1922 represents the absence of any demand for coal for steel-making purposes in the first half of the year, coupled with a loss of from 250,000 to 300,000 tons consequent upon the two weeks strike of the United Mine Workers in August.

The public is generally unaware of the price paid by the coal industry of Nova Scotia for the assistance in men and ships that it gave to the prosecution of the war. The enlistments from among the coal-mining population were, to the extent of ninety per cent. of the total enlistment from the collieries, taken from the faceworkers. The number of men actually producing coal was thereby diminished, while the ranks of the non-producing laborers and auxiliary workmen remained but little lessened. Immigration since 1914 into Nova Scotia has been negligible. The existing population cannot provide the miners required to replace the deficiency caused by enlistments, and, unless miners are brought in from abroad, this deficiency must persist for a generation or so. Paradoxically maybe, but nevertheless quite logically, this shortage of coal diggers exists alongside a surplus of other classes of workmen, and has been accompanied by serious unemployment of coal diggers and auxiliary workmen alike.

Increased Production Costs

Combination of high wages (or a high rate of wages) with the unbalanced condition of mine organizations due to shortage of coal diggers, has raised the cost of producing coal to a point which has made it difficult for Nova Scotia coal operators to sell coal in competition with outside fields, and this has caused unemployment. The replenishing of the ranks of the coal diggers would cheapen the cost of coal and create greater opportunities for employment, but it is difficult to make unemployed men see any advantage in bringing new men in from the outside. The opposition of the unions to the employment of new men is probably not a smaller difficulty than the virtual impossibility of obtaining skilled miners, for precisely the same situation exists in Britain and those European coal-mining centres that were drained of men by the wastage of war.

Recovery From Depression

Following the customary lag in relation to the trade conditions of the United States, the steel industry in Nova Scotia did not feel the full effect of the depression in steel demand

General view of the Sydney Steel Mills in Nova Scotia.

until almost a year after steel plants in the United States had closed down on a wholesale scale, and, correspondingly, the recovery from this memorable depression is only just setting in in Nova Scotia, although in the United States steel plants have been operating at seventy per cent. of capacity, and more, since the spring of the year.

The Dominion Iron and Steel Company's plant at Sydney has two blast furnaces in operation, and is making all the products for which the plant is equipped except steel rails and plates. The demand for wire products is especially good, and the Steel Company is reaping benefit from its modern and well equipped nail and wire mills. There is a fair demand for billets, most of the shipments being sent to the Scotia plant at Trenton, where the mills are quite busily engaged in the manufacture of small plates, angles, rail fastenings, and the general line of small steel products for which the Trenton plant is so well equipped, and because of which this plant fits in well with the Sydney plant, generally designed for large tonnages of large-sized steel products.

Ready for Rail Demand

The Sydney Mines Plant of the Scotia Company has been idle since the autumn of 1920, and it is unlikely to be operated until such time as a demand arises for steel rails and plates, in which event the blast furnaces and open-hearth plant at Sydney Mines will function as a convenient supplement to the Sydney plant.

The Sydney Plant is now, with the exception of the open-hearths, a well-balanced and modern unit, having coke-oven capacity of the most modern kind for a sufficient blast-furnace output, combined with adequate and up-to-date power plants. The rail, billet, wire and rod, nail and plate-mills are in good shape, able to produce good tonnages at economical expenditures, but the open-hearths are capable of much improvement, although very satisfactory performances are being obtained from the existing furnaces, considering the age of the installation.

Wabana Ore Operations

The consolidation of the iron-ore properties at Wabana, Bell Island, has put under one management an ore property capable of producing ore to any desired annual quantity, and there are now no hindrances to selective mining of ore or technical operation of the mines, the property being entirely at the disposal of one management. In a property where the leases and holdings of two companies are so intimately connected as is the case at Wabana, the advantages and economies resulting from unity of management are very great. All questions of management and transportation have been simplified by consolidation, and matters of sale policy also. The export of iron ore to Europe, which before the war was largely carried on from Wabana, has been resumed on a large scale, and there is little doubt that in years to come the export trade in iron ore will exceed in extent the use of iron ore in the steel plants in Nova Scotia.

The iron ore reserve at Wabana constitutes the largest and most accessible body of ore, commercially available, in the North Temperate Zone, and owing to the steady depletion of the Lake Superior reserves and the never very great European reserves, Wabana will in years to come be looked to to provide iron ore for the needs of the steel industry on both sides of the Atlantic. The iron ore deposit off Bell Island is probably the outstanding asset of the British Empire Steel Corporation.

Busy on Car Repairs

The Eastern Car Co. at New Glasgow, which has for some time been without orders, is now busy on repairs to Grand Trunk Railway cars. This plant can produce cars at prices which give it a wide competitive range, and its ability to manufacture cars and allied products has been largely increased by the affiliation with the British Empire subsidiaries and the not inconsiderable amount of work that the Corporation itself needs to be carried out on railway and mine-car equipment.

The equipment needs of the Canadian railways, as is well known, have been delayed about as long as they can be, and activity at the Eastern Car Plant should be expected to continue.

While there is no reason to expect a demand for steel products such as was witnessed in the war years, it seems very probable that a real improvement in steel demand has set in and will continue for some years. Optimism for the near future is fully justified in regard to the steel industry in Nova Scotia.

HON. W. E. FOSTER.

New Brunswick on Forward March

By HON. W. E. FOSTER,
Premier of New Brunswick.

NEW BRUNSWICK, let me tell your readers and the rest of the world, is on the forward march. One of the most important basic industries of the Province, that of lumber, is again functioning with considerable activity. The pulp situation is likewise showing improvement. Advances are being made in coal mining, also in the production of lime and gypsum.

With the utilization of the hydro plant which has just been completed by the Provincial Power Commission at Musquash, industrial expansion along broad lines is expected. From an agricultural standpoint, as far as crop yields are concerned, the Province has made marked progress this year, but unfortunately market conditions at the present moment are not up to the anticipated standard. This situation, however, should show early improvement. New Brunswick, with its extensive coastal area, is the producer of great varieties of splendid fish, but in this line, too, there is not the activity that the quality of the product is deserving of.

The Province is the possessor of many natural resources outside of those above indicated which offer great possibilities. With its fertile farm lands, beautiful orchards, great sporting opportunities, wonderful scenic attractions, healthful climate, good roads, active open ocean ports and its many other advantages, New Brunswick undoubtedly offers one of the finest home-making and industrial opportunities that is to be found on the North American continent. It is also a Mecca for tourists from all points of Canada and from all States of the Union. The Provincial Government, co-operating with the governments of the other Maritime Provinces, is endeavoring to do its share toward building up this important area of the Dominion and is getting good results. Further objectives are now being planned.

Loading grain for the United Kingdom at the Government elevator, Vancouver.

Export Equipment Must Be Well Organized

Much Being Done to Co-operate With Manufacturers—How Intelligence Service is Being Used—Actual Cases in Which Buyers and Sellers Have Been Brought Together—Details of Export Market

IN ORDER to ascertain the extent to which the service of the Commercial Intelligence Service of the Department of Trade and Commerce is being employed by manufacturers, Canadian Machinery has been making enquiries. In reply, some very interesting material is made available by C. H. Payne, secretary of the Service.

Export business has had increasing attractions for Canadian producers. Empire trade has its advantages, and, realizing this, one thousand American plants, representing large investments, have located here. This number is increasing by 200 a year. The coming year will augment the number and it is becoming increasingly evident that manufacturers are interesting themselves in every essential entering into the growth of this business.

Canadian trade commissioners are showing keen appreciation of the fullest co-operation with manufacturers. Much is being done and much remains to be done in the broadcasting of information calculated to be of service to buyers and sellers, to the end that Canadian trade may be developed.

Following the series of questions and answers referred to, several enlightening instances are given in which manufacturers and prospects have been brought together and actual transactions closed.

Another feature of the article deals with the import requirements of the countries in which Canada is represented by a trade commissioner, the amounts purchased from Canada and exports to this country. Many of these items were subjects of enquiry during the past year.

Value of the Service

Question.—Do Canadian manufacturers, while abroad, make use of the offices of Canadian trade commissioners?

Answer.—The weekly diaries forwarded by trade commissioners to the department contain a record of all visitors to their offices, from which it would appear that representatives of Canadian firms travelling abroad do make considerable use of the service. Many firms, of course, have their own permanent offices in foreign countries and do not to the same extent use the trade commissioner's.

Q.—Do Canadian manufacturers, returning from abroad, make available to the department any useful information obtained by them?

A.—Generally speaking, exporters returning from abroad do not communicate to the department the results of their investigations. As a rule, business men prefer to keep private their own affairs. Occasionally, however, on their return to Canada we write to manufacturers, of whose visits we have been advised by own trade commissioners, and ask them for their impressions.

Q.—To what extent are Canadian manufacturers making use of the information available in the department?

A.—Interviews by trade commissioners during their visits to Canada, and by junior trade commissioners during the course of their tours for training indicate that the information furnished is very highly appreciated in a great many cases.

Q.—What kind of information seems to be most in demand?

A.—This is an extremely difficult question to answer, as the information in demand covers a very wide range, but generally speaking it can be stated that it relates to the products of this country for which there is a market in foreign countries. It might also be added that many specific inquiries are received in regard to the following: (a) Names of importers in foreign countries. (b) Appointment of suitable agents abroad. (c) Trade statistics for particular commodidies. (d) Customs duties in foreign countries and tariff rulings. (e) Proper forms of invoice, etc.

Q.—Do manufacturers extend co-operation of any kind to the department? Is it desirable?

A.—Manufacturers, who are familiar with the service co-operate to the fullest extent. They are always willing to give information, and are exceedingly glad to have visits from trade commissioners, junior trade commissioners and officers of the Department. In the majority of cases, where a Canadian exporter has received assistance from a Canadian trade commissioner, he voluntarily notifies the department of the facts, and expresses his appreciation of what has been accomplished.

Q.—Instances in which the services of the department have been of distinct benefit.

A.—Choosing certain instances which have been reported in the last few months, the following might be instanced:

(a) In September a vessel reached Buenos Aires and according to our information, 80 per cent. of the total values of the ship's manifest was due to the efforts of our trade commissioner directly or indirectly. There were 30 shipments listed from Canada including the following items: malt, cloth, paper, adding machines, tire chains, paint, steel wire, maple skewers, printing paper, nail wire.

(b) Within the past few months a Canadian firm has secured, through the efforts of our trade commissioner in Australia, orders for 8,000 telephones.

(c) A few years ago, a firm manufacturing carriage wheels, etc., entered the South African market, and our trade commissioner there recommended the appointment of a suitable agent. According to the testimony of the manager of this firm, last year, when the domestic market was dead, this factory was able to run for 48 hours per week on their export orders to South Africa alone.

(d) Another instance was that in which 90,000 tons of wire were diverted from an United States manufacturing plant to a Canadian branch, owing to the efforts of a trade commissioner.

(e) In a very small way, a man in Canada undertook to market a product which he had patented, and to-day, largely through the advice and assistance of Canadian trade commissioners, he is exporting to practically every country in the world, or at least to those countries in which the Commercial Intelligence Service is represented.

(f) A firm in Ontario was producing a certain type of table. When the demand in the domestic market appeared to be satisfied, he was advised by this department to undertake exportation. As a beginning, he enlisted the services of a trade commissioner in Great Britain and today his export trade is regarded by him as entirely satisfactory.

(g) The export manager of one of Toronto's large exporting houses stated in an interview recently, "I would feel just as confident in placing my business in the hauds of our trade commissioner ..... as I would if I were on the ground myself. He has the happy faculty of grasping just what is required and backs this up with a thorough knowledge of his territory, its requirements, and Canada's ability to supply them."

(h) A small manufacturing company in Toronto who desired to cultivate an export market, shipped samples to the trade commissioner abroad and reports, "As a direct result of his activities, I am doing a substantial business now, and hope to sell $25,000 annually there."

(i) A trade commissioner in South Africa represented to the municipal engineers of a South American city, the ability of a certain Canadian firm to supply material for a large civic contract. This Canadian firm, on the advice of the trade commissioner, appointed an agent and secured an initial order for $20,000 worth of material. Previous to this a Scotch company, known the world over, had practically a monopoly.

In addition to the above, according to our records, there are many instances in which manufacturers have voluntarily notified the department that they have been enabled to work up a profitable business owing to the direct assistance of our trade commissioners abroad.

WHERE CANADA BUYS AND SELLS

Australia, D. H. Ross, Melbourne.—Imports fiscal year ending June last—£101,063,661, decrease £62,267,479. Exports, £127,949,455 decrease £3,975,636. Stocks of merchandise have since become somewhat depleted, hence with the continuance of a prospective good season, and the present purchasing power of the Australian people, imports should soon indicate considerable expansion in value. Imports in metal and metal products included agricultural implements, electrical and gas appliances, hardware lines, electrical cable and wire, iron and steel bars, rods, pig, scrap, pipe fittings, rails, fishplates, etc., machinery, alloys, motor bodies, chassis and cycles, tinplates, vehicles and parts, motor cars, footwear. Direct imports from Canada in 1920-21 are given at £4,646,352. Imports of agricultural implements in that period amounted to £917,920 of which £425,435 represented Canadian products. Factories for agricultural implements, however, are in operation in all of the States, and some export business has developed. The shipbuilding industry at Sydney is important. The Commonwealth has greatly increased in wealth in the past two decades.

In 1901, production was valued at £114,585,000; of recent years this has increased to £350,000,000. A recent report states, "Importers selling certain classes of machinery on the usual time payment system, report that their collections this year have been above the average and that farmers and dairymen are enjoying a period of prosperity."

Imports from Canada, year ending September, 1922, £14,251,011. Exports to Canada, $1,377,922. Canadian sales included large items under the heading of wood products, including paper, and iron and products.

* * * *

Argentine Republic, B. S. Webb, Buenos Aires.—Requirements of seven million population in manufactured products are all filled from abroad. Canadian agricultural implements are sold in quantity, binder twine, newsprint, edge tools, autos, auto tires, wall paper and lumber of Canadian make find ready market. Some steel products are being sold at lower prices than those quoted by the United States and Europe. There is a growing market for electrical material, the imports in 1920 under that head being $4,700,000. It is estimated that 40 per cent. of fixtures and 70 per cent. of appliances used are of local manufacture. Much material such as wire, cable, motors, dynamos, conduits, lamp sockets, dry cells, etc., are imported from U. S., United Kingdom, Germany and Italy. Though highly competitive in this respect, the market is not without opportunity for Canadian manufacturers. The shoe industry has grown so that only the better classes of shoes are imported. Total trade amounted to $1,250,000,000 in 1921. Chief products are grain, wool, hides, sheepskins, frozen and chilled beef, and frozen mutton.

Canada exported, 12 months ending September 1922, products valued at $3,850,953, largest item being iron and its products, wood and wood products. Canada imported goods to value of $2,516,497 chiefly animal products.

* * * *

Belgium, A Stuart Bleakney, Brussels.—Exports for past year were 17,160,355 metric tons, valued at 17,160,355 thousand francs; imports, 175,110,863 metric tons valued at 10,054,583 thousand francs. Countries from which Belgium has purchased goods to greatest value are France, Great Britain, Germany, Holland, United States. For twelve months ending January, 1921, the total Canadian exports to Belgium were $12,642,495 as compared with $47,717,448 in 1920. Exchange rates and high prices in general are given as a reason for the slump. There has never been a decided improvement in the outlook for Belgian business, however. There is a market for Canadian hardware, hand tools such as forks, rakes, hoes, shears, lawn mowers, sprayers and agricultural goods, which have to be stocked in Belgium during January or February and offers should be made well in advance of this period. Canadian firms can either make direct offers to firms or send samples and full data to Trade Commissioner's office whence effort will be made to interest suitable firms and exporters should specify conditions of sale.

Canada exported to Belgium year ending September 1922, products to value of $12,041,221; imported from Belgium, $3,817,931. The largest export from Canada was in vegetable products.

* * * *

Brazil, Major E. L. McColl, Rio de Janeiro.—Market featured by highly developed sales organizations. Firms represented can quote on goods delivered at buyers' warehouse. The edge tool trade is keenly contested. Carpenters', cabinet mak-

In the accompanying article instances are given where Canadian manufacturers and prospective buyers abroad were brought much closer together, and business actually closed, through the agency of the trade commissioners.

ers' and bench tools are required for the building trade. The exchange situation has caused weakening in Brazilian trade and importers have been cutting down stocks in many commodities. There is, however, a slight improvement. Much electrical equipment had been imported by Brazil in connection with hydro-power development.

Canada exported, year ending September, 1922, $1,306,825, chiefly animal products, and iron products. Canada imported $1,657,147, chiefly vegetable products.

* * * *

British West Indies, E. H. S. Flood, Bridgetown, Barbados, also for British Guiana.—Canadian imports by Trinidad include flour, cornmeal, oatmeal, cheese, pickled fish, undressed and dressed white pine lumber, box shooks. These lines are also imported by Barbados together with birch staves for molasses puncheons. Canada, in 1920, exported £14,705 in shoes to the West Indies out of a total of £287,617. The use of motor buses for transport has been developed recently in Bermuda. There is a demand for edge tools, agricultural implements and tools, machinists', coopers', farmer's, blacksmith's, shipwrights' tools and other hardware lines. Canadian trunks and valises, brooms and brushes, chemical manures, iron and steel manufacturers, paper, wood and timber, paints and colors, have been increasing in demand in British Guiana. While the demand for motor vehicles is dependent upon the prosperity of these colonies, there is steady growth although the possible market is comparatively small. For the first six months of 1921, Jamaica imported tires and tubes to the value of £32,000 of which four fifths were from United States. British Honduras also imports food products, condensed and evaporated milk, confectionery, wearing apparel, grocery specialties, beverages, textiles and bicycles. Canadian goods, exported, for year ending September, 1922, $9,514,785; large items of vegetable and animal products, iron and wood products. Canada imported $12,360,627, mostly vegetable products.

* * * *

China, J. W. Ross, Shanghai.—Canadian goods which can be sold in China include soft wood timber, railway sleepers, paper, fish, fruits, flour, bacon and dairy products, rubber goods, woollen textiles, boots and shoes, typewriters, electric lighting and heating fixtures, enameled and aluminum ware, small hardware, finest drills and files, iron beds, lawn mowers, felt hats, machinery and engineering materials. During 1921, 41,000,000 square feet of Douglas fir were exported from Canada to China.

Canada exported, year ending September, 1922, $2,266,747, chiefly wood, wood products and paper and iron and non-ferrous metals and products. Canada imported $1,516,946, chiefly vegetable and animal products, fibres and textiles.

* * * *

Cuba, J. L. Gonzales, Hoyela, Havana.—Canadian goods marketable here are wheat flour, potatoes, codfish. Yellow pine, white pine and spruce are used here, much of the pine and spruce coming from Canada. Canada exported, year ending September, 1922, $4,337,497, chiefly vegetable products. Canada imported $9,346,437, chiefly vegetable products.

* * * *

Norway and Sweden, C. E. Sontum, Christiania, Norway.—Hides, skins, leather and leather goods, coal, fertilizers, tanning exports, Douglas fir, whitewood, deck planks, mining machinery, asbestos fibre and asbestos products, chemicals, asphalt, paints, colors, varnishes.

Canada exported year ending September, 1922, $3,150,972, chiefly vegetable products, Canada imported $745,956, large items being animal products and iron and its products.

* * * *

Straits Settlements, P. W. Ward, Singapore.—Newsprint, canned fruit, chemicals, foodstuffs, electrical goods, machinery, building materials, dredging equipment.

Canada exported, year ending March, 1922, $608,294, chiefly wood, wood products and paper. Canada imported $1,445,774, largely in vegetable products.

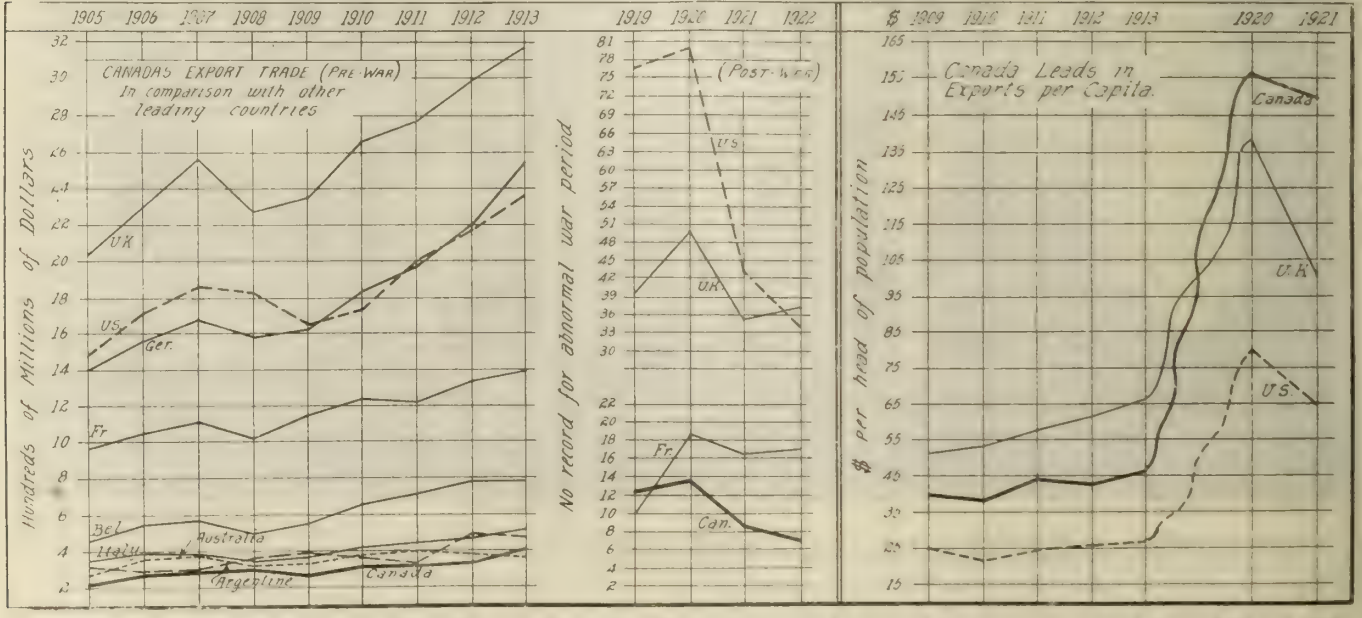
* * * *

South Africa, W. J. Egan, Cape Town.—Metal products, barbed wire, cement, cabinet makers' metal fixtures, cements, doors, mouldings, furniture, carpets, linoleums, stoves, plumbing materials, engineering equipment, sporting goods, printing machinery, motor cars and accessories, agricultural implements, are required here.

Canada exported, year ending September, 1922, $4,612,015, largely in vegetable products, wood, wood products and paper, iron and products. Canada imported $228,512, largely in vegetable products, fibres, textile and textile products.

* * *

New Zealand, W. A. Beddor, Auckland.—Parchment papers, hardware, hollow ware and ironmongery, wrought iron, wire and wire fencing, bare copper, agricultural implements, cement, paper hangings, newsprint, wrapping paper, calcium carbide, stationery, foodstuffs, wearing apparel, motor cars and accessories, fruit, grass and clover seed, insulated cable and wire, japanned and enameled leather, lorries, trucks, vans and buses, fur and fur trimmings are imported. The total value of imports into New Zealand from Canada for



Charts showing the comparative extent of Canada's export trade since 1905. No record is made of the abnormal period between 1914 and 1918. The centre chart shows that Canada now has fourth place in the volume of export business.

the year ending December 31, 1921, was $7,911,290, a decrease from the previous year of $4,023,285.

Canada exported, year ending September, 1922, $5,226,932, large items being wood and iron products. Canada imported $1,790,856, largely vegetable products.

* * * *

United Kingdom: Harrison Watson, London; J. E. Ray, Manchester; J. Forsyth Smith, Liverpool; A. B. Muddiman, Bristol; Major Gordon B. Johnson, (Scotland and Ireland), Glasgow, Scotland.—Dairy and agricultural products, grains, cereals, flour, hams and bacon, household goods, brushes and toilet materials, calcium carbide, mouldings, condensed milk, canned salmon, textile, machines, rivets, nuts, bolts, galvanized link wire, tinned mattress wire, rivet and screw wire, hollow ware, baby carriage fittings of aluminum, pneumatic drills, artesian well pumps, ecclesiastical woodenware, cement, hay mixtures, galvanized products, steel bars and sections, kraft and wrapping papers, proprietary articles, sugar, grocery lines are imported.

Canada exported, year ending September, 1922, $311,294,751, large items being vegetable, animal, wood and iron products. Canada imported, $127,437,704, large items being in vegetable, animal and metal products, fibres and textiles.

* * * *

Holland, Norman D. Johnston, Rotterdam.—Canned goods, dried apples, chemicals, surgical and rubber goods, wallpaper, linseed oil cakes, asbestos, mica, beeswax, agricultural implements, are imported.

Canada imported from Netherlands, year ending September, 1922, $4,599,284, large items being vegetable products and non-metallic minerals and chemicals. Canada exported, $9,547,512.

* * * *

United States, Frederick Hudd, New York City.—Enamelware, glassware, rye, corn, glucose, durum, wheat, poultry, cattle, fish, food products; raw materials such as metals, chemicals, etc.; manufactures for further use in manufacturing, wallpaper, newsprint, pulp and pulpwood, furs, fertilizers, are imported.

For the twelvemonths ending September, 1922, the imports into United States from Canada amounted to $322,624,068; outstanding items being wood products and paper, non-ferrous metals and products, animal and vegetable products, non-metallic minerals and chemicals. Canada imported $492,965,967, large items being iron and iron products, vegetable and animal products, fibres and textiles, non-metallic minerals and products and chemicals.

* * * *

France, Lieut.-Col. Hercule Barre, Paris.—Canadian goods in demand include boots and canoes for recreation purposes, agricultural implements, grains, flour, tractors, tinned fruits, jams, lumber, wood pulp, sulphite, acetone, cobalt salts, fish glue, salmon, lobster, lumber and wood products.

Canadian products imported for twelve months ending September, 1922, were $11,307,042, largely consisting of vegetable and animal products, wood and iron products. Canada imported $12,342,753, in which large items were fibres and textiles, chemicals, vegetable and animal products.

CANADIAN EXPORTS

1922 Year Ending October	$815,530,510
1921	926,654,122
To United Kingdom	193,755,967
1921	166,746,900
To United States	200,812,638
1921	166,654,122

In total exports, October showed an increase of $22,733,665 over the same month of 1921.

CANADIAN IMPORTS

1922, Year Ending October	$740,261,771
1921	859,710,152
From United Kingdom	77,914,841
1921	63,349,105
From United States	282,534,114
1921	304,882,272

In total imports, October showed an increase of $7,356,953 over the same month of 1921.

Jamaica, G. R. Stevens, Kingston.—Flour and feed, vegetable and animal products, refrigerators, stationery, carriages, canned goods, beverages, metal products, are imported. Imports of Canadian goods for twelve months ending March, 1922, were $2,215,164, a large item being animal products. Canada imported goods to value of $2,213,873, chiefly vegetable products.

* * * *

Italy, W. McL. Clarke, Milan.—Footwear, cordage, vegetable products, grain, hides, skins, wheat, agricultural implements, metal products, are imported. Purchases from Canada, year ending September, 1922, were $12,097,798, largely in vegetable products. Canada bought from Italy produce valued at $1,674,353. Large items were vegetable fibre and textile products.

* * * *

Japan, A. E. Bryan, Yokohama.—Rubber footwear, cullulose acetate, dairy cattle, leather, Douglas fir, newsprint, flaxseed, steel strips for bicycle tubing, textiles, umbrellas, agricultural machinery, motor trailers, glasine paper, canned fruits and jams, dairy products, are imported.

Canada exported, year ending September, 1922, $16,599,444. Canada imported $7,449,636. Large export items were non-ferrous metals and products, wood, wood products and paper, vegetable products. Canadian imports were largely made up of fibre, textile and textile products, vegetable products and non-metallic minerals.

* * * *

India and Ceylon, Major H. A. Chisholm, Calcutta. Agricultural implements, tractors, sugar, wheat, motor cars and carriages, are imported. During the fiscal year 1920-21, 1938 motor cars, out of 15,432 imported, were from Canada. Machinery importations have been large. Other import lines are iron and steel goods, paper, pasteboard and stationery, pressed steel wheels, railway plant and rolling stock, yarns and textile fabrics, wire fencing, rivets, bolts, nuts, packing house products and galvanized goods.

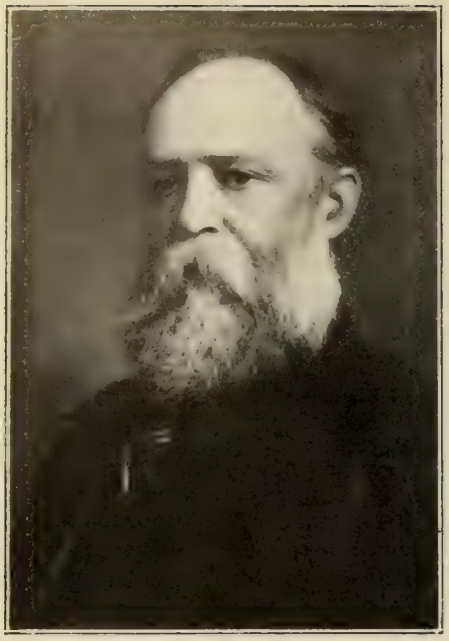
Canada exported in twelve months ending September, 1922, $2,430,253, chiefly in iron and products. Canada imported, $10,307,427, largely in vegetable, fibre and textile products.

* * * *

Germany.—Canada exported to this market goods valued at $5,729,213, in year ending September, 1922, large items being vegetable and animal products, non-ferrous metals and products, and non-metallic minerals. Canada imported $1,304,827, a large item being chemicals.

* * * *

Greece.—Canada sold to this market products valued at $6,003,424, chiefly in vegetable products. Under the same heading Greece sold to Canada, products worth $921,191.



The Future of Canada

"Optimism must be ballasted with common sense. Without optimism we can ruin Canada or any other country."

By Sir EDMUND WALKER.
President of The Canadian Bank of Commerce.

IN EUROPE they are holding one conference after another in order to wrestle with the most difficult problems the world has ever faced. They seem not to accomplish anything except endless talk, but they are really passing through processes of education, and at least it may be said that each conference kills some new scheme by proving it to be impracticable and to this extent the air is clearer.

In Canada we have our own very serious problems to face but, because there are so many brights spots in our future as compared with Europe, we are in danger of some day finding ourselves in that paradise of fools in which national destruction finds its root.

Trustees of Largest Country

By confederation we became the trustees of the third largest country in the world. We had no conception of its fertility, nor have we yet for that matter. We know that its winters bred strong men and that its summers were beautiful beyond praise, but we feared the north all the same, and only experience has taught us how good for man and beast our north country is.

We know that our people were British and French, the latter already tried out for over two hundred years, and we faced a future of great uncertainty with the spirit of Samuel Chapdelaine and of the prairie schooner.

As a country we are not isolated like Australia and New Zealand, but we have to make our experience alongside the great and prosperous people to the South. This propinquity should never be forgotten when we consider our relation to the Empire. We cannot escape the powers of attraction of 110 millions speaking the same tongue, nearer the warm latitudes, with great cities, further advanced powers of production, and possessing the clearing-house of North America in all financial transactions with the outside world, New York. Because of this we grow in population slowly and retain our sons and those who come to us from abroad, with difficulty in the East, while in the West, the land-seekers leave the United States and come to us.

Transportation Great Problem

When we faced the difficulties of confederation we realized that the greatest problem was transportation and although we have overbuilt for the moment in railroads, it is still our greatest problem. Let us see how we managed this problem so far as railways are concerned. We first accomplished as part of the understanding in confederation, the Canadian Pacific and the Intercolonial railways. I need not recall the moments of doubt and despair over these ventures. The one, the Canadian Pacific Railway was eventually a surprising success, the other remains a railroad built for political reasons and although under the recent improved encouragement, it is doing much better, it should not be considered from a purely business point of view.

After years of struggle the time came when the power and prosperity of the Canadian Pacific Railway seemed to demand that a second transcontinental railway should be built and the Canadian Northern Railway system was the result. *Had no other transcontinental system been built we should today be in a condition nearly perfect for our time in Canada's history.* The second transcontinental system was the result in the selection of routes, in material, engineering and cost the result of what we had learned in the construction of the Canadian Pacific Railway, and of itself it would have afforded that competition with the Canadian Pacific which the country demanded. In grades and cost it was an accomplishment so great that some day the Canadian people will praise instead of criticise the two men who built it.

But for some reason, not I am sure understood by any Canadian who has not been admitted to the secrecies of politics, a third transcontinental system was planned. Some of us thought that the government of the day was stark mad and today we know that this was true, but perhaps it was thought that the men who were building the Canadian Northern Railway would stop half way in their undertaking and capitulate. Whatever should have been the outcome, the fact is that we have three complete transcontinental systems instead of two. And while no private company would have built the Intercolonial or that vast sinkhole of money, the Transcontinental, and the government has therefore always been the owners, the state has also been obliged, mainly because of the overbuilding, to take over both the Canadian Northern Railway and the Grand Trunk Pacific, and because it was completely involved in the fortunes of the Grand Trunk Pacific, the old system in the East of the Grand Trunk Railway has also fallen into the hands of the state.

My purpose in recalling what must be well known to all of you is to cause you to bear in mind as you watch the fortunes of the government railways and compare the whole results with the Canadian Pacific Railway that a vast mileage of the government system should never have been built and much more of it, say the Grand Trunk Pacific has been built a generation or more before it could be expected to pay. Long after portions of the government system have justified their existence by handsome profits, other portions will be showing large losses, only in many districts to be avoided by scrapping the road.

Settlement and Production

Whether any government can give the system its only chance of success: administration by officers selected purely for their ability as railroad managers, and freedom from political interference, or not, the duty of the country as a

MUST HAVE FREE HAND

"Given a strong, fearless and efficient organization, and with the free hand which all officers of successful enterprises enjoy, there is no reason why the transportation problems of the two systems should not be handled as effectively and as fairly as if they were privately owned and operated."—E. W. Beatty, president, C. P. R., at banquet to Sir Henry Thornton.

whole is clear. *We must so manage as to build our country up to the railroad mileage where that is possible. This means land settlement and industrial production generally.* We have obtained immigrants heretofore largely by the North American plan; an invitation to all so-called white people to come and share our fortunes, and as the land-worker is always hard to get, we have given away 160 acres to any settler and have so allowed him to select it as to be the cause in part of our present railway overbuilding.

We need a new immigration policy very badly indeed. We want land settlement almost alone at the moment and Europe has no land-workers to spare, but she has millions of the kind we do not want. We can no longer afford to give 160 acres away for nothing, even if the policy was ever a good one, and we must force Western settlement on the unworked lands, largely privately owned, within the areas provided with railroad facilities. What is needed in land settlement in the prairie provinces is needed also in every other province.

I am not able to suggest how this is to be accomplished. The work of our Soldiers' Settlement Commission shows that it can be accomplished if both the Dominion and the Provincial Governments will bend to the task. Great Britain is probably willing to join in the financing of some types of settlers. Mr. Noxon, our own agent-general has just made most interesting and practical suggestions. Quebec is exploiting its plan and there are many other suggestions.

Call of Dominions

When in London a few months ago one could not pass the day without evidence on every hand of Australia's needs and New Zealand and South Africa were not far behind in their alluring statements and offers to those who desired to leave Great Britain and venture in the outlying parts of the Empire. Offices in splendid buildings, exploitation on a large scale of products, cinemas every day, advertising of a lavish character, the names of these Dominions in every mouth, made one feel that Canada had allowed herself to be forgotten and that in any event she seemed to be clearly intimating that she did not want what the others so fiercely demanded. It is true that in this depressing time certain of our agents-general are fighting most vigorously against such odds for their provinces but they are having a hard time.

It is not numbers that we need but land-settlers. We can afford to spend more money and more effort on one real settler than on a score or more of mere immigrants. The one we should search for in the agricultural districts of Great Britain and of Europe and elsewhere if he is a good type and is willing to be taught farming. The other will be at our gates trying by every device to get in. We have filled our cities and our factories with the other and have nearly lost the social conditions which once made us sure that we could build up a law-abiding and even a high minded democracy. The problem of placing men without capital but with agricultural experience, or even willing to be taught first, on land with necessary improvements to be paid for by annual amortizations over twenty or thirty years is not new, and our Dominion and Provincial legislature must develop schemes to this, or some such, and immediately if we are to avoid large annual increases to our national debt caused by deficits in working our national railroads.

Problem of Taxation

Apart from these deficits we can balance our national budget and perhaps in a time not far off our new requirements for provincial, municipal and industrial growth, but it is certainly only by continually increased production that we can possibly prosper as a nation. And as only half of our people are devoted to agriculture we must increase our manufactures in at least a like proportion. This brings me to the point of next importance to land settlement in our future, that is, the incidence of taxation. We do not need to be told

A SOLVENT ENTERPRISE

"It will be necessary for Parliament to provide further sums needed for capital expenditures whereby the National System of Railways will be established as a solvent enterprise. Happily we seem to have passed the first milestone. There will be no operating loss during the current year. The combined revenues of the National and Grand Trunk Systems will meet the combined operating charges, and will leave a substantial surplus to be applied toward the fixed charges."—Sir Joseph Flavelle, retiring chairman of the board of the Grand Trunk Railway System.

TO STOP DRAIN ON TAXPAYERS

"Let it be emphatically understood, now—once and for all—that there is to be no political interference, direct or indirect, in the administration and working of the Canadian National Railways. There are four factors which constitute the sum of successful railway administration: First—Adequate net receipts. Second—The development of the property to meet the requirements of future traffic. Third—The relations between the railways and its men. Fourth—The relations between the railway and its clientele. Our national railways must earn, roughly, $40,000,000 net annually, to stop any further advances from the government; that is to say, to stop the drain on the taxpayer. How soon this can be brought about, I hesitate to say: but I will go so far as to indicate that it may not be so far distant as most people might imagine." — Sir Henry Thornton, newly-appointed president of Canadian National Railways.

MUST BE LAND SETTLEMENT

"Administered by officers selected purely for their ability as railroad managers, and freedom from political interference, or not, the duty of the country as a whole is clear. We must so manage as to build our country up to our railroad mileage where it is possible. This means landed settlement and industrial production generally. We need a new immigration policy very badly indeed. We can no longer afford to give 160 acres away for nothing, even if the policy was ever a good one, and we must force Western settlement on the unworked lands, largely privately owned, within the areas provided with railroad facilities. It is not numbers we need, but land-settlers. We can afford to spend more money and more effort on one real settler than on a score or more of mere immigrants."—Sir Edmund Walker, president, Canadian Bank of Commerce.

that if we borrow for private or public needs in another country we can only pay interest or principal by creating and shipping more goods to a relative value. We know how anxiously we watched to see how far we could absorb our own war bonds knowing what it would mean to owe that much more to the United States. Why is our dollar at par and why are we in so different a position from the allied nations of Europe and our enemies? It is because we found the cost of the war mainly at home.

It used to be an accepted view that a nation could not be ruined by a debt due to its own people, but super-taxes and other expedients for relieving the bulk of the people, and levying taxation as far as possible upon a few citizens or a few business ventures had not then been carried to such extremes.

We are often told that the business of the modern politician is to bribe the poor with the money of the rich and Robin Hood has always been so popular that if the injustice went no further than it sounds we might not hope to avert it. *But what we cannot afford to do is to cripple industry by the absence of fresh capital, and what is worse, to kill the desire for enterprise.* As we have not arrived at socialism and the state does not support all of our hospitals, asylums, churches, universities, art galleries, museums or other institutions for the good of the people, what do we think will become of these institutions for social well-being when we have completed the ruin of those who possessed a surplus out of which to give?

Result of Super Taxes

Doubtless many will think I am exaggerating the result of super-taxes but I am sure, at least, that I am not exaggerating the result of such extreme taxes as are now being levied in Great Britain, the United States and Canada. The empty consulting room in Harley Street may not stir you nor the empty seats in the theatres in London. The bitter exclamation of the British taxpayer that the tax collector "seems determined to leave us nothing but our brains" touches us nearer, but I heard nothing more conclusive than the quiet but emphatic statement of one large landowner that with the present income and death taxes the families in Great Britain who have no income from trade or outside sources, would not last longer than three generations. It there are any here who think that it matters little if such people are forced to what is termed work, I have no time to deal in full with them, but I will give you one example of what is already happening.

In mid-summer in London every newspaper, every hoarding, every mail disclosed the appeal "Save our hospitals" and with the King's personal letter urging everybody to help in one of the direst emergencies London had ever faced, a great campaign was being carried on. When I left England the subscriptions were pathetically inadequate and many hospitals had closed. That sign on countless London buildings, "Supported by Voluntary Subscriptions," the splendid evidence that people in Great Britain with a margin in income remember their social duties, may as well be obliterated. The people cannot have it both ways. The super-tax has absorbed the surplus out of which the "voluntary subscriptions" for the public good were made.

Debts Will be Paid

Our war debts must, of course, be paid. *Great Britain will pay the United States if it breaks her back and we too are debt-payers and don't understand anything else.* Even if we could prevent the terrible waste of money by governments we must levy taxes that hurt if we are to pay our debts. We are proud of our share in the war. We are now a nation and a member of the League of Nations and our voice in its councils is listened to with respect.

Do any of us really wish to escape whatever may be our fair share of the cost of the war? I refuse to believe that there are such Canadians. We can levy certain taxes which will not hurt production, will not hurt any individual materially and will raise what is needed for the war debt. Even with such taxes we should still have graded income taxes that will hurt, but would not positively crush, and men with a surplus would not as many do now, refuse to invest in industrial stocks in which the government proposes to share the profits and leave the investor to bear the losses. If you doubt this consider the dealings in tax-free bonds in the United States. I leave this subject with the warning that our system of taxation will set Canada back for years, while a reasonable system would demonstrate that no nation need be ruined by a debt to its own people.

Canada's Great Opportunity

I think it very hard to speak in what may seem a doubtful vein about Canada. I am by nature an optimist and when I survey the future of other nations my heart leaps at the possibilities of Canada. We have the greatest opportunity of any country in the world. But optimism must be ballasted with common sense and without common sense we can ruin Canada or any other country.

The conditions of life in Canada have in the last quarter of a century improved beyond our highest hopes. Our farms, despite some lean years, are better cultivated, better stocked with animals as to number and far better as to quality, less in debt down to two years or so ago, than any prophecy we had made. Our cities are a surprise to all visitors. In our universities, colleges, schools, conservatories of music, art galleries, museums and in most of the things which make life worth while, and which give us a place among world's leaders of opinion, we have arrested the attention of outsiders who come in numbers to be convinced that such a growth has really taken place.

Pulling Together

We have done this by pulling together. The so-called rich have given millions beyond estimate to bring this about and down to three years ago it was comparatively easy to get money for any cause which would better life in Canada. Just now the fountains are drying up rapidly. It will be better for all of us if we conclude to be fair to each other and pull together again in our vast task of the future of Canada.

SHERBROOKE PLANTS ACTIVE; METAL TRADES DOING WELL

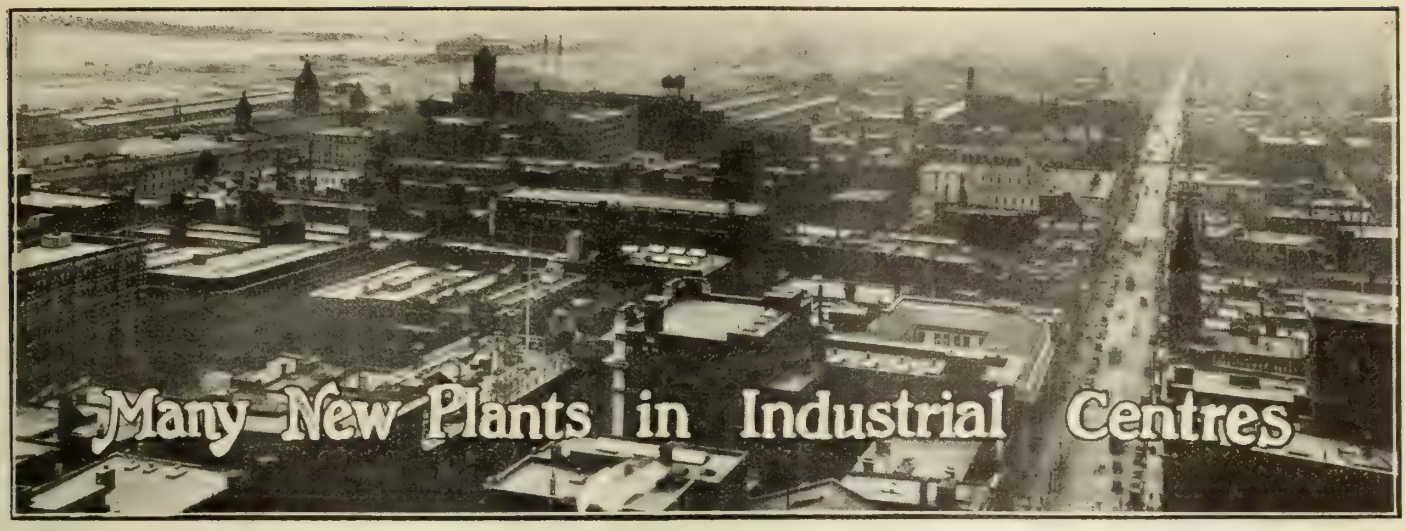
By J. H. BROSSEAU,
Secretary-Treasurer Board of Trade.

ONE OF THE most important industrial developments of the year is the decision made by the Johns-Manvile Co., Ltd. to erect a large factory at Asbestos, Que., for the manufacturing of finished asbestos products. Work on the new plant is expected to start early in the coming spring. The cost of erecting this plant, together with its equipment, will be in the neighborhood of $1,500,000. This big concern has been doing extensive underground development this last year, so that a sufficient quantity of raw material can be assured in order to supply the new plant. It is claimed that this will be the first manufacturing concern in Canada which will turn out a complete line of finished products such as roofing, insulations, packings, etc., and the elimination of duties and freight rates should have a decided effect in reducing the cost of many of the products now being secured through the United States.

Here in the Eastern Townships conditions are generally good and the mills have been operating at a high degree of capacity except for a few exceptions. Conditions in the paper industry are relatively good, prices were firm during the past month. Paper productions during September were 27 per cent. larger than in the same month last year. Manufacturers' stocks are lower than last year, while shipments are larger.

There was little change in the activity of the metal trades between September and October and, in fact, dealers reported during November that their sales had fallen off. The metal trade, however, are nevertheless operating at a higher rate than they did in the fall of 1921, or, in fact, at any time since the business depression started.

As to labor conditions, unemployment has practically ceased in this section of the country.



View of downtown Toronto looking west from Board of Trade Building. To the left is Toronto Bay, on which extensive reclamation work is being carried out in connection with an elaborate waterfront scheme.

Sturdy Growth Rather Than Speculative Prospect

Increases in Industrial Activities Throughout Canada—American Branch Factories to Make Most of Opportunities—Western Cities Also Make Gains—Cheap Power Strong Factor

Information given below epitomizes, to a large extent, the annual reports of Industrial Commissioners, Secretaries of Boards of Trade, or other officials in close contact with equipment employed in the expansion of their respective towns and cities.

INDUSTRIAL centres report, on the whole, a very encouraging year with reference to new plant location. Some have made more pronounced gains than others, reflecting recognition of some particular advantage in available facilities. There is apparent a reasonably conservative attitude on the part of municipalities toward new propositions. The tendency is to eliminate bonuses or any inducement that seems to encourage purely speculative propositions. It is generally felt that thorough investigation and sound business-like conditions will be sufficiently attractive to any concern that is serious in its intentions.

Those municipalities that are best organized to draw prospective manufacturers make gratifying reports as to the past year, and all view the coming year with optimism. American branch factories have been well represented. Expansion of export trade with the British Empire has been a strong inducement to these concerns, and there is a growing feeling that the future will show very material development in this respect. Discussing reasons why American enterprises are turning their eyes toward Canada as a base for branch operations, a publication circulating largely among United States manufacturers recently pointed out:

"The most marked development of the trade of Canada in 1921 was the decline in the value of operations with the United States. In 1920 the total value of this trade was $1,512,000,000; in 1921 was a drop to approximately $930,000,000. Imports from the United States suffered most; in 1920 they were $921,625,000, whereas in 1921 they were approximately $574,000,000. At the end of the year trade with the United States was found to be in a much sounder and better balanced condition than it was at the end of 1920. At that time the balance of trade against Canada in favor of the United States was $347,000,000; on the operations of 1921 it was only about $230,000,000. All of which emphasizes the need of a branch factory in Canada to supply that country and the other units of the British Empire.

"In the task of making herself self-sustaining, Canada is being helped by the course of events. Canada is an exporting nation of importance and this development is making it increasingly possible for Canadian manufacturers to produce commodities in quantity and bring down initial costs. The development of Canada's export trade has stimulated the imagination of the Canadian manufacturer; he sees more clearly his opportunities in the world's markets and he is filled with an ambition to make the most of these opportunities. The inevitable outcome will of course be greater ability on the part of the Canadian manufacturer to hold his own domestic markets against outside competition; even the competition which he has most to fear—American competition. This will mean less buying in the United States as time goes on, and increase to a still greater degree the urgent need of the American manufacturer going to Canada; and through the instrumentality of a branch factory, answering the demand for domestic-made wares."

One of the most important features of the year, as regards industrial relations between Canada and the United States, was the return of the Canadian dollar to par, and the approach of the pound sterling to within close range of a like position. Thus, it may be said, an important factor in the alignment of English-speaking countries for commercial intercourse has been re-established, and the coming year should see a great improvement.

Following are statements from industrial centres, describing the past year's record:

BRANTFORD HAS RECORD YEAR DECIDEDLY HOPEFUL FUTURE

By W. H. WOOD, Manager Chamber of Commerce

BRANTFORD.—Competition between the hundreds of Canadian communities for the few industries of merit seeking a desirable location is very keen. Inspired by Brantford's success, sister cities have been stimulated to action. Canada will reap the benefit.

No city of Brantford's size in Canada has over the past four years had as many industries established within its borders. Included in this statement are those factories whose managements established them without the aid of any community organization. The city is the greater benefited thereby:

From the United States: J. & J. Cash Inc.; Robbins & Myers; S. C. Johnson & Son, Ltd.

Other gains: Brantford Brass Foundry Ltd.; Brant Foun-

dries Ltd.; Thermo Electric Co. Ltd.; Happy Thought Co. Ltd; Schuler Button Co. Ltd.; Lockwood Mfg. Co. Ltd.; D. J. Hanna Co.; Parisian Knitting Mills Ltd.; Bradley's Machine Shop; Ruddy Mfg. Co. Ltd.; Crown Electrical Mfg. Co. Ltd.; Dominion Dress Co.; Ontario Gypsum Co.; Brantford Computing Scales Ltd.; Bluebird Corporation, Ltd.; Kanadda Biscuit Co.

Extended their plants: In addition to this, long-established firms have built additions to their plants. Included in this number are: Slingsby Mfg. Co. Ltd; Massey-Harris Co. Ltd.; Sterne & Sons, Ltd.; Cockshutt Plow Co.; Dominion Flour Mills, Ltd.; S. C. Johnson & Son, Ltd.

The splendid efforts of men responsible for the development and increasing of Brantford's industries bear striking testimony to the principles of the modern chamber of commerce that service to establish industries is not the least important part of a community program of industrial development. Thus the Brantford Chamber of Commerce, while putting forth persistent efforts through the Industrial Commission to interest basic and diversified industries to locate in Brantford, has endeavored to render every possible service to encourage and expand home industries.

It is realized that every factory is a great potential source of wealth to our community and to Canada, and that they are of greatest actual value only as they are running to fullest capacity. A recent survey of 216 cities in connection with industrial development shows their citizens consider the greatest industrial expansion to have been due to the enlargement and growth of existing plants.

To assist local manufacturing plants is, therefore, sound economics. Included in chamber of commerce activities for established industries are much appreciated features including: Domestic and foreign trade promotion; employment bureau; trade commissioner services; trade enquiries; home products exposition; trade information and data; aid in insuring adequate service to industries by public utilities; transportation problems; directories, codes, etc., and community advertising so that the city's products may find a ready market.

Protecting the Public

Many propositions have been investigated with the result that Brantford has been protected against questionable stock selling campaigns. This phase of the program of industrial development is universally recognized by chambers of commerce and industrial commissions as being proper and scientific. This policy safeguards the interests of the whole community and has already saved Brantfordites at least one hundred thousand dollars in three instances where promoters "turned down" here went to other cities and defrauded citizens of those cities out of this amount. The general policy, considered wise and safe, of the Brantford Chamber of Commerce in connection with stock selling propositions is that of not assisting in the promotion or financing of such.

Propositions of this type may be all their promoters claim them to be, or they may not. The Brantford Chamber of Commerce never endorses any. But with the municipal council, the Brantford Chamber of Commerce has the "best" city in Canada in which legitimate industries are encouraged to locate. A city that has all the facilities that make a city a good city in which to locate, work and live. These facilities include a good class of workmen, central location, excellent lines of transportation—steam, electric, highways—homes, schools, churches, parks, playgrounds, etc.

Retail Trade

With the lessening of unemployment through the upward trend of trade and the migration of men to centres where work is assured, a much better condition exists in wholesale and retail trade circles. Purchasers are better able to pay for commodities ordered; there is not the same call for credit; lines of credit having been carried over a number of months are being reduced, with the result that merchants are moving goods and replenishing depleted stocks from the wholesale houses. This movement in the right direction is having a strengthening effect on the mercantile community in particular and all in general.

The outlook for the coming year is decidedly hopeful. Every person desiring work may find employment. Factories are becoming busier and are employing men at standard wages.

* * * *

STEADY INDUSTRIAL GROWTH AT POINT OF POWER PRODUCTION

NIAGARA FALLS.—It is evident that the day has gone by when this city is satisfied with the oft-applied designation, "the city beautiful." It has long ago recovered from that complacency naturally arising from its possession of one of the wonders of the world, and is now emphasizing the fact that, as here is the hub of hydro-electric power production, here should be the scene of greater industrial activity.

Although the American city opposite has preserved its beauty spots, it has not neglected the fact that, grand as nature may be, it is industrial development that contributes immeasurably to the upbuilding of a prosperous community. Many important plants line the river on the American side. It is true that there are stacks and factory buildings in sight on the Canadian side, and there is, in fact, a good showing of industries, but some impetus is working into the movement to make the record one that is more compatible with its location at this strategic point, with its potential electric development of 840,000 horsepower, whence many other thriving towns and cities in Ontario have been receiving their supplies of electric energy.

Already headway has been made. Several new industries have been placed, others are in prospect. Like other border cities, Niagara Falls has the advantage of being within comparatively easy distance of American concerns desirous of locating branch factories in Canada, it is within an hour of Buffalo, and its rail facilities comprise all important Canadian lines with international switching and transferring service. From shipping and marketing viewpoints it is, in general, a gateway to Canada, but a threshold to busy Ontario in particular.

Naturally the city is assured a supply of electric power adequate for all requirements. The present price is about $17.50 per horsepower per annum. It is this abundance of power that practically explains the presence in the Falls' zone of such large concerns as the American Cyanamid Co., the Carborundum Co., the Union Carbide Co., Acheson Graphite Co., the Herbert Morris Crane & Hoist Co., Dominion Chain, Canadian Shredded Wheat, American Can, Ramapo Iron Works, Spirella Corsets, and three silver works—Oneida, William Rogers and McGlashan Clarke, depending to a large extent upon electricity and electrical processes. Among recent additions to the industries of Niagara Falls is Dominion Insulators, Ltd., the Canadian branch of the Ohio Brass Co., making high tension insulators and insulating materials and electrical brass goods.

The Robert Mfg. Co., of Lockport, N. Y., manufacturing knives for paper mills, is an infant industry which has outgrown its first factory and is now building a more substantial one of cement and steel.

Adjacent to the city is the industrial area reserved for factories by the Hydro-Electric Power Commission. This is near the Chippawa-Queenston power canal, and here it is proposed to allocate sites to prospective factories. The layout of the entire district, however, lends itself to good industrial location.

It is not so long ago that the prediction was made that the time would come when this entire peninsular zone from Niagara Falls westward to Hamilton would be practically an unbroken row of industrial plants. Niagara Falls, when that time comes, according to F. C. Clarke, industrial commissioner, will be found to have held up her end.

* * * *

HAMILTON IMPROVES POSITION EIGHTEEN NEW INDUSTRIES

By C. W. KIRKPATRICK, Commissioner of Industries.

HAMILTON.—Taking into account the fact that practically the whole world has been, and still is, passing through a period of reconstruction, Hamilton has no reason to complain of the industrial progress made during the year 1922.

True it has not been a year of unsurpassed activity or prosperity but it has been a year of substantial growth and development and the closing months find conditions greatly improved over the opening months of the year, while the improvement over the corresponding months of the preceding year is even more marked.

To be more explicit, Hamilton has not experienced any boom during the year 1922, but there has been a slow but steady and permanent recovery of industrial and general trade conditions, which gives every promise of being maintained until a condition of normalcy is reached, possibly in the spring of 1923. Confidence—not only on the part of the purchasing public but also on the part of the retailer, wholesaler and manufacturer—which was so badly shaken by the slump of two years ago, is being restored and all classes are beginning to take a more optimistic view of the future than they have been able to take for some considerable time. And, best of all, Hamilton is emerging from the period of business uncertainty and depression without having sustained any very serious scars or wounds. Reverses, some of them quite serious in their nature and extent, have been met and overcome, but there have not been any serious failures and there are many indications that business in general is coming out of the fire of trial in a much more healthy condition and on a much more substantial basis than it went in.

Industries Reduced Forces

During the winter of 1921-22 the unemployment situation was very acute. While few industries were forced to close down entirely, nearly all were forced to greatly reduce their working forces or their hours of operation owing to scarcity of orders and general business stagnation, with the result that many heads of families and others were either thrown out of employment altogether or placed on such short time that they found it impossible to make ends meet, and the city spent a very considerable amount on unemployment relief. But with the approach of spring conditions began to gradually improve.

Slowly but steadily the industries began to absorb the surplus of labor and with the opening of outdoor work the need for unemployment relief disappeared and it was discontinued. Throughout the summer months conditions continued to improve, with some fluctuations. The textile industries in particular continued unusually busy and the steel and iron industries began to pick up. There was little industrial or commercial building, but house building became more active than at any previous time in the city's history, the building permits as a whole exceeding those of the preceding year and almost equaling those of the record-breaking years of 1912 and 1913.

It was feared by some that the improvement might not be permanent and that the fall would again see a return of unemployment conditions as they were a year ago, but such has not been the case. On the contrary, the factories, as a whole, have continued to increase their working forces each month and though many of them are not yet back to normal, indications are that the year will close with but little unemployment and bright prospects ahead for the year 1923. The recovery of the steel industry was somewhat hampered by the long-drawn-out coal strike and even yet some of the larger industries are feeling the effects of the coal shortage, but it is anticipated that this will shortly be overcome.

Conditions Satisfactory

General business conditions continue very satisfactory considering what has gone before. Manufacturers, wholesalers and retailers all report that the confidence of the purchasing public is gradually being restored and that orders are being received in greater volume than for many months past. At the same time it cannot be denied that all classes are purchasing more conservatively than was their wont during the prosperous years immediately following the close of the war. They are buying only for their immediate needs. This is taken as a healthy sign, anticipating, as it does, that the days of skyrocketing and speculation are over and that all classes of business men have settled down to their pre-war policy of doing business strictly on a business basis.

The unusual volume of house building during the first ten months of the year is in itself an indication of a renewed confidence in the continued growth and prosperity of the city. Despite the fact that there has been practically no industrial building this year, the value of the building permits for the first ten months reached a total of $4,421,890 compared with $4,639,450 for the whole of the preceding year. The population, according to a census taken by the assessment department in the early fall, also showed an increase of 1,992 and now numbers 120,235, while the city's assessment is now $140,-854,340, an increase of $4,939,400 over that of 1921. The majority of the homes for which permits were issued were of moderate size and value, such as might be required by the working and middle classes.

Eighteen New Industries

The fact that there was practically no industrial building during the year does not mean that there was not any industrial growth or development. On the contrary, Hamilton improved its industrial position by adding eighteen new industries up till the end of October, while negotiations are pending that should result in several others being secured before the close of the present or early in the new year. Eight of these new industries were of either United States origin or parentage, the most important being the Canadian branch of the Beech-Nut Packing Company, of Canajoharie, N. Y., one of the best-known food products industries in the United States. All of the new industries commenced operations on a modest scale and were able to secure temporary accommodation in existing manufacturing buildings, but many of them give promise of developing in both size and importance just as rapidly as normal conditions are restored throughout Canada. The new industries and their respective lines of manufacture are:

Beech-Nut Packing Co., (Canajoharie, N. Y.), chewing gum, confections and food products; Beacon Electric Co., electric lamps; Beacon Soap Co., castile soap; Canadian By-Products Co., (Scranton), fire brick; Canadian Shell Oil Co., oils; Climax Cleaner Mfg. Co., (Cleveland), wall paper cleaners; Diamond Devices, Ltd., automobile accessories; Devine, J. S., woodenware products; Dexter Lock Co., (Grand Rapids), locks; Gerrard Wire Tying Machine Co., (Chicago), wire ties; Jones, A. C., & Co., hardware; Kismet Co., silk and mull underwear; McColl Bros. Ltd., oils; Pilgrim Product Co., soft drinks; Security Fountain Pen Co., (Chicago), fountain pens; Townsend, Krug & Greaves, (Perry, N. Y.), cutlery; Whistle Bottling Co., (New York), soft drinks; Woods, W. A., & H. S. Johns, crushed colored stone.

Another important industrial development was the commencement of manufacturing operations by the Firestone Tire & Rubber Company, which located in Hamilton about two years ago but whose plans were considerably interfered with by the period of depression. This year the company completed its first manufacturing unit and during the month of September started manufacturing tires. By the end of October it was manufacturing practically all classes and sizes of tires and it is expected that by the end of the year it will be operating to the capacity of the first unit with a working force of not less than 500 and that next year considerable extensions will have to be made.

Outlook Promising

The outlook for the future industrial development of the city was never brighter. During the year the city's department of industries and publicity had correspondence or other negotiations with upward of 500 American and British industries that contemplate establishing Canadian branches as soon as conditions warrant. It was noticeable that early in the year the interest of the outside manufacturer was rather passive—he was interested and glad to receive all the information he could get, but there was little to indicate that he contemplated making a move at an early date. During the fall months, however, a considerable number of those who had carried on negotiations by correspondence earlier in the year sent representatives to personally investigate local and Canadian markets and manufacturing conditions, indicating a more active interest and leading to the belief that in the not distant future they will be ready to act on the information they have been getting during the quiet times. Hamilton, therefore,

looks back on the year 1922 with no small measure of pride and satisfaction and looks forward to the future with every confidence.

* * * *

SARNIA INDUSTRIES EXTEND; FUTURE VIEWED WITH OPTIMISM

By GEORGE P. TRANCE, Manager Chamber of Commerce.

SARNIA:—There have been no new firms commence operations in Sarnia during the past year, and no marked changes in the industrial development of this district during the year. Some of the industries have experienced considerable difficulty in getting in their raw material, which has caused them to abandon plans for increases in output. On the whole, however, practically all the plants have enjoyed a good year.

The John Goodison Thresher Co. are building an addition to their plant, which will enable them to increase their production considerably; the Holmes Foundry Co. increased production this year; the Peninsular Sugar Co. are building a new plant at Petrolia and should be ready for operation next season; the Dominion Alloy Steel Corporation has completed the purchase of plant site adjoining the city limits and the purchase money has been paid; erection of plant has not yet been started.

In summing up the industrial situation, this district has enjoyed a very good year and is very optimistic for the immediate future. Building to date has been very brisk, the number of permits issued for the year to October 31st is 621, with a total value of $752,190. The value of permanent improvements, such as sewers, sidewalks, curbs and water mains, in the city of Sarnia for the past year amounts to $43,300.

Conditions in the building trades are good and no skilled men are out of work here. There will be considerable building carried on here during the winter months. There is very little unemployment and the outlook is good for the coming winter. With reference to encouraging prospective industries, depending upon the industry, its size, and its relationship to other industries, various concessions can be arranged through the city council and the taxpayers.

* * * *

WINNIPEG INDUSTRIAL GROWTH ASSISTED BY CHEAP POWER

By J. M. DAVIDSON.

WINNIPEG, MAN.—Most of Winnipeg's industrial development during the year has been confined to smaller industries, of which no less than 148 have been established. Included in the list are printers and bookbinders, candy manufacturers, sheet metal works, food products, restaurants, brushes, paper boxes, laundries, music publishers, bedding manufacturers, gloves, soft drinks, dyers and cleaners, bakeries, loose-leaf books, washing machines. Both the Coca-Cola and Orange Crush Bottling Company, have enlarged their plants during the year and the following soft drink manufacturers have established factories: Lucerno Co.; Green River, Ltd., and B. B. Bottling Co. A branch of Child's restaurant was established early in the year and is said to be one of the most outstanding successes in their chain of restaurants.

Outlook for the coming year seems to be very favorable. There is no doubt that the immigration plans which are now being formulated will result in benefit to the city of Winnipeg. The $10,000,000 hydro-electric power plant which is rapidly nearing completion will vastly increase the supply of hydro-electric power for manufacturing purposes. The prospects are that an aggressive campaign for industries will be conducted. Indications are that 1923 will be a good building year. Several large undertakings are in prospect and we look for a record year in home building.

The chief encouragement for industries in Winnipeg is the cheap hydro-electric power and unexcelled transportation facilities. No free sites or bonuses of any kind are offered to prospective industries.

Early summer there was very little demand for laborers other than for farm work. During the next three or four months conditions improved very materially. The demand has been decreasing during the past ten days and unemployment has commenced to manifest itself. This is due largely, of course, to the influx of men to the city from the country. Congestion in the city is not nearly as great as during the past two years. Heavier demand for bushmen than corresponding period in 1920 and 1921.

Men engaged in building trades are finding steady employment and will continue to do so as long as fine weather lasts.

Wages for mechanics average fifty cents per hour; unskilled help forty-two and a half cents per hour. Bush workers $35 per month, including board and room. Pulp-wood cutters $4 per double cord. Tiemakers from twelve and a half cents to fifteen cents per tie.

Men going to farms for winter, work for average wage of $15 to $20, a number receiving as high as $25 per month, but others getting only $10 per month.

* * * *

FORT WILLIAM ADDS NEW INDUSTRIES

By W. WEBSTER, Secretary Board of Trade.

FORT WILLIAM.—The several industries that were initiated this year include a tannery for which a site has been acquired and machinery is being selected; expected to be in operation in the spring of 1923; a small factory now in operation, making any kind of string instrument; a plant manufacturing small ornamental statuary from composition resembling marble. Another small industry in the embryo stage is the Swanson Ornamental and Structural Iron Works, which has a commodious site at the west end of the city and is away to a good start. Additional equipment is being installed as required.

A good deal of grain elevator construction has been done, notably the additions to the Northwestern and Paterson elevators.

The Canadian National Railways are at present constructing a large railway terminal to be known as the Mount Terminal; this is situated close to the western boundary of the city, and entails the construction of two and one-half miles of main track and about ninety miles of terminal track.

Present plans call for a twenty-four stall roundhouse, provision is made for an additional twenty-four stalls which shall be added as required. Industries generally have enjoyed a good year; there have been no industrial disputes.

* * * *

BROOM FACTORY FOR OWEN SOUND

By R. D. LITTLE, Secretary-Treasurer, Board of Trade

OWEN SOUND.—One industry commenced operation here during the past year, namely, J. F. Jeffcott, broom maker.

We give tax exemption for a period of ten years if approved by the ratepayers, by way of assistance to prospective industries.

There is not much unemployment here, though some industries were running only four days per week. Laborers are receiving from 30c to 39c per hour.

* * * *

GUELPH'S INDUSTRIES IMPROVE; GOOD PROSPECTS FOR NEW YEAR

By H. WESTOBY, Guelph Chamber of Commerce.

GUELPH:—The industrial situation in this city is very much better today than it showed prospects of doing at the beginning of the current year. The basic industries of Guelph are the iron and steel, rubber, woodworking and textiles. The iron and steel trade, which began the year at very low ebb, has gradually improved throughout the year, and practically all of the Guelph iron industries are now on full time, with prospects of continuing so throughout the winter. The woodworking, rubber and textiles industries, are all running overtime, and report very large orders on their books.

The outlook for the coming year is therefore viewed with complacency by practically all of the Guelph manufacturers.

Three new firms have located in Guelph during the current year: Lander Bros., Ltd., from Buffalo, N.Y. They established a silk hosiery industry in this city. J. T. Arnold & Sons have erected a new factory in which they will manufacture excelsior. The McArthur Construction and Engineering Co. have acquired property and have now a large equipment incidental to such a business.

Guelph has been in times past willing to grant fixed assessments to new industries of merit, and I think it is very likely that such a policy will be continued. Through the kindness of a local resident there is a large acreage of manufacturing ground available, which will be given free of charge under certain obligations.

The building trade for Guelph reports $900,000 worth of new buildings under construction for the current year, and in addition to this, several very large new buildings are just being completed for the Ontario Agricultural College, which is outside of the city limits.

The civic officials have carried out a very extensive paving program, and have laid nearly 7 miles of new concrete highway this year, whilst the Suburban Road Commissioners are just completing the eighth mile of new concrete paving from the city limits. The radial railway has been completely overhauled, and new rails and track laid, involving an expenditure of very close to $300,000. The result of all this work has been that we have had a dearth of unemployment, and on the contrary laborers have been difficult to secure in many instances.

* * * *

CALGARY'S NEW OIL REFINERY WILL BRING OTHER INDUSTRIES

By J. H. HANNA, Secretary Board of Trade.

CALGARY, ALTA.—In connection with Calgary's industrial development the principal feature of the year was the location of the new refinery of the Imperial Oil Company in this city. After a thorough investigation Calgary was selected as the most suitable site in this Province for the plant in question. The present plans provide for a plant to cost at least $2,500,000 and will have a capacity of 3,500 barrels per day. This will provide steady employment for at least 250 men, but there is no doubt a much larger number will be required, as in addition to the manufacture, the distribution of the Imperial Oil Co., will be centered in this city. Other contingent industries will follow.

Another new industry is the Rocky Mountain Paint Co., which has been started this year, and which is developing our natural resources, as most of the raw material in connection with this industry is found within a short distance of Calgary.

In connection with industries already established here, the Ford Company are putting up, at a cost of $150,000, a new building to take care of their increased business. The plans make provision for further extensions as required.

Another Telephone Exchange, to take care of the rapidly expanding telephone business, was built in the north-west part of the city at a cost of $115,000, including equipment. Calgary has now five telephone exchange buildings located in different parts of the city. These take care of 16,000 subscribers.

The Riverside Iron Works have improved and enlarged their plant at a cost of $25,000 in order to take care of their increasing business. The D. V. Cope Co., wholesale furniture dealers, have extended their business and are now manufacturing a number of lines of furniture here. There has also been an extension to the Totem Manufacturing Co., who handle gum vending machines and store fixtures.

Other industries in Calgary, including the C. P. R. car shops which employ on an average of 1,125 men; the P. Burns Packing Plant with 400 men and women employed; the soap works, flour mills and sash and door factory, etc., have all been pretty fully employed throughout the year.

In connection with the retail trade, the new Arcade Building just opened, formerly the Pantages Theatre Block, leading from 8th Ave. through to 7th Ave., is attracting considerable attention. In this building are housed fifteen different lines of trade.

Under the laws of Alberta municipalities are not permitted to give bonuses or financial assistance to prospective industries. The city, however, agreed to make a fixed assessment on the new plant of the Imperial Oil Co., and assurance was given by the Provincial Government, that if a plebiscite on the question was submitted to the people and carried by a large majority, the necessary legislation would be passed confirming this agreement. The matter was submitted to the electors and carried by a large majority, in fact there was scarcely any opposition whatever.

The crops have not turned out as well as was anticipated some months ago, and this, of course, has some effect on business. There is not much change in the unemployment situation, and it is anticipated that the city will have to take care of quite a number during the winter months.

* * * *

RECORD BUILDING IN STRATFORD

By A. W. DEACON, Secretary-Manager Chamber of Commerce.

STRATFORD:—There has been a strong, steady, general improvement in industrial conditions in this city during the past year. Our furniture factories are working well up to strength and full hours, and in some cases overtime. The Stratford Frames & Novelties, Ltd., purpose establishing a plant in this city, commencing building operations as early in the new year as possible. Plans and specifications are now out, and work will be rushed along. During the past summer building operations have by far exceeded that of any other year in the city's history. This, together with a great deal of permanent road work done by the city, has amply taken care of any unemployment, and, at the present time, unemployment is at a minimum.

VICTORIA HAS LARGE ADDITIONS

By GEO. I. WARREN, Industrial Commissioner.

VICTORIA, B. C.—There have been approximately one hundred and sixty new businesses established in Victoria during the past year. The business prospects for the coming year are exceedingly bright. Not since the years of 1910 and 1911 have the indications been as favorable as now.

The city assists prospective industries in the matter of leasing city lands, and granting certain concessions in regard to water rates, etc. Laborers' wages are governed here by union laws, and are the same as elsewhere in Canada. The employment conditions are rather better than during the previous winter.

WOODSTOCK MAKES PROGRESS; INDUSTRIES APPROACH NORMAL

By H. SYKES, Secretary Board of Trade.

WOODSTOCK, ONT.—At the close of 1922, the industrial activity of Woodstock has seen a decided improvement over the early part of the year. At the present there is a spirit of optimism throughout Woodstock and district, generated by the increased business which has come to our industries. The furniture industry is well pleased with present business coming in and prospects for the future. There has been a marked increase during the past three months. The textile industries are very busy in some departments and steady business is certain until spring. The stove industry and foundries are all very busy and report that they have sufficient business in process to keep them going for several months. The music industries report that at present there is a marked improvement over the same period last year. These industries would be very busy if they had even a reasonable amount of the foreign trade they had previous to the war, but they report it is impossible to secure this owing to the high cost of delivery charges and the tariff against Canadian instruments in Great Britain and the colonies. This splendid foreign business is being diverted to Germany owing to these obstacles. Wood-working industries, including the wagon factories, report business about the same, with prospects of a slight increase. There is very little business com-

ing from the West to these industries and they report collections much behind.

A high record has been made in our local customs. The returns for October are the highest in the history of the Woodstock office. The figures show that local trade has grown tremendously. For the month of October the total collections amounted to $38,174, which were the highest ever registered in one month since records were kept in Woodstock. Compared with last year, the collections for October were almost double. The sales tax amounted to $26,000. In 1921 these were only $7,931. This shows the extent to which business has grown in the city and district since a year ago.

Building activities are well maintained. Permits for this year continue to show a satisfactory increase over last year's figures. The total for the ten months of this year is more than double the amount for the corresponding period in 1921.

Two very important industries have been established in Woodstock during this year. The Woodstock Pipe Organ Builders, Ltd., report business excellent. This new industry has recently made shipment of four large pipe organs and have many prospects for early business.

The Oxford Milk Products Company is now operating. The capital of this company is placed at $150,000. The plant which was recently installed cost $80,000. The plant is now receiving five thousand pounds of milk a day and expects in a short while, to be using double this quantity. Should this plant operate to capacity, it is capable of using thirty thousand pounds of milk per day. Shipments were recently made abroad, to different parts of the British Empire.

The Bell Telephone Company has erected a new building on Graham street. It is a three story building of red tapestry brick, with white stone trimmings; of fire proof construction and will be equipped with the latest switch boards of the common battery type. The cost is estimated at $130,000. As an evidence of how the Bell Telephone service is appreciated in Woodstock, it is interesting to note that under the able management of Mr. Davidson, the number of telephones has increased from five hundred and three in 1910 to fourteen hundred and ninety-eight at the present time. This is considered a wonderful increase, especially when considering that the population of Woodstock has not greatly increased during this period.

At present, several of our industries are advertising for skilled mechanics. The general consensus of opinion among our business men is that as prospects now seem, our industries should be running almost to normal during 1923.

STRONG RECOVERY OF ST. JOHN FROM AFTER-WAR PARALYSIS

R. E. ARMSTRONG, Secretary Board of Trade.

ST. JOHN, N. B.—New Brunswick, whose open ocean ports and varied natural resources in agriculture, fish, timber, lime, gypsum, coal, oil shales, hydro power, and minerals offer such splendid opportunities for the development and expansion of Canada's world trade, has begun this year to show marked symptoms of recovery from the after-war business paralysis which has affected so many countries.

St. John is sharing in the progress of other sections of the province. The lumber industry is improving and several mills are operating actively here. One of these mills, belonging to Stetson, Cutler & Company, known as the Jordan mill, was suddenly wiped out of existence by fire, as well as a large quantity of lumber.

The Stephens Brick Company's plant (formerly the Lee Bros.' plant) which was only established a few months ago, was also burned recently. While all the wood-work in the buildings was reduced to ashes, the machinery was only slightly injured, and the plant, it is expected, will soon be re-established again.

The Nashwaak Pulp Company's pulp mill is in active operation, and throughout the province there is a general improvement in pulp conditions. At Bathurst, the pulp mill there proposed carrying on the manufacture of news-print paper. No other mill in the province is engaged in paper-making.

The Simms Brush Factory, the Cornwall and York Cotton Mills, and the several nail factories of the city are quite busy at present; so also is the Atlantic Sugar Refinery, which has been doing a large export trade this year.

There have been few new industrial enterprises started in recent times, although several are being considered, among them a marine railway dock plant, and a cooperage factory. With the effective functioning of the new hydro-power system, which has just been installed at Musquash, the outlook for the new year is very favorable. The assistance that is usually extended by the city to new industries consists in a reduced valuation for assessment purposes, or in the lowering of water rates or other charges.

The port outlook for the coming winter is very bright. The grain elevators are being filled up and a large increase in grain shipments is anticipated.

With the lumber mills operating, a large winter cut of timber is looked for, building conditions improving and a busy harbor season expected, there should be very little unemployment at St. John this season.

CHATHAM REPORTS FAIR OUTLOOK

By W. R. LANDON, Manager Chatham Chamber of Commerce.

CHATHAM.—There have been no new manufacturing firms located in Chatham this year. The prospects for next year are fair.

We do not assist by bonus, loan or guarantee. Other concessions of importance, however, are given to thoroughly reliable concerns.

There is no unemployment just now. The weather has been mild and consequently labor has been very well employed. Ordinary labor runs from 30c to 40c per hour.

HISTORICAL SUMMARY OF THE AUTOMOBILE INDUSTRY IN CANADA
1910-1921

	Year	Establishments No.	Capital $	No. of Employees	Wages Paid $	Cost of Materials $	Value of Products $
Automobile Manufacturing	1910	8	4,699,256	2,204	733,558	3,808,139	6,251,885
	1915	8	14,019,455	3,619	2,669,333	16,739,643	24,357,627

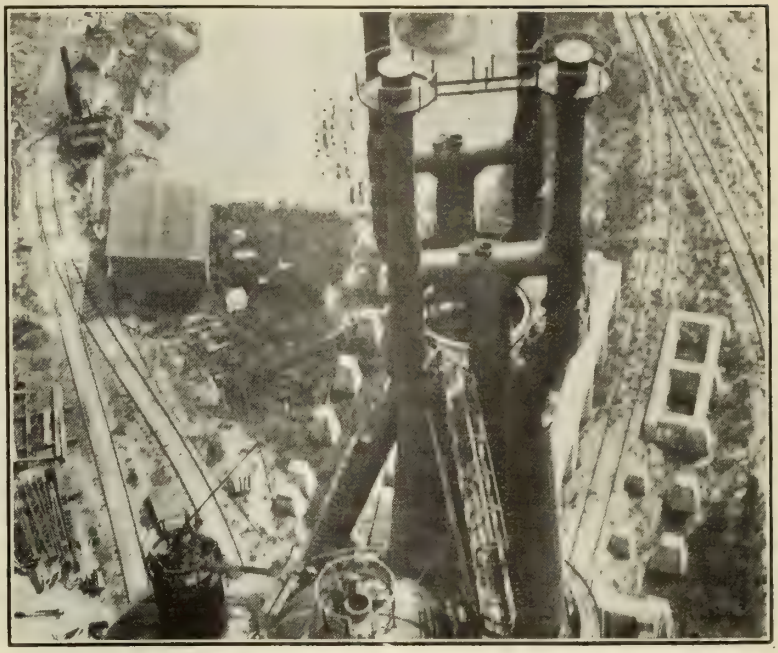
	1919	42	8,364,991	1,378	1,462,144	5,221,439	8,571,890
	1920	62	15,332,887	2,764	3,747,149	10,603,632	19,361,882
	1921	64	15,700,288	1,824	2,254,636	8,229,855	14,783,017
Automobile Repairs	1910	11	361,272	109	55,332	40,893	170,930
	1915	120	3,540,441	1,233	944,561	2,434,197	4,329,938
	1917	497	4,431,926	1,542	1,200,958	1,961,773	5,091,066
	1918	675	5,832,710	2,022	1,853,450	1,835,989	6,461,262
	1919	1,236	13,628,288	3,375	3,389,794	4,368,810	12,004,970
	1920	2,503	19,943,913	4,688	4,932,203	6,671,767	16,592,623

In the year 1915 the returns for Automobile Accessories and Repairs were not separately reported.

Visioning Canada's Future Steel Market

Canada Steel Corporation Has Expended, to Date, Seven Millions at Ojibway, Ont., in Preparation for the Country's Development—Location Favorable to Larger Export Trade.



View from top of 250 ft. stack, looking down on No. 2 blast furnace. To left are seen group of piles for additional furnace foundations. Plans call for 14 furnaces in all.

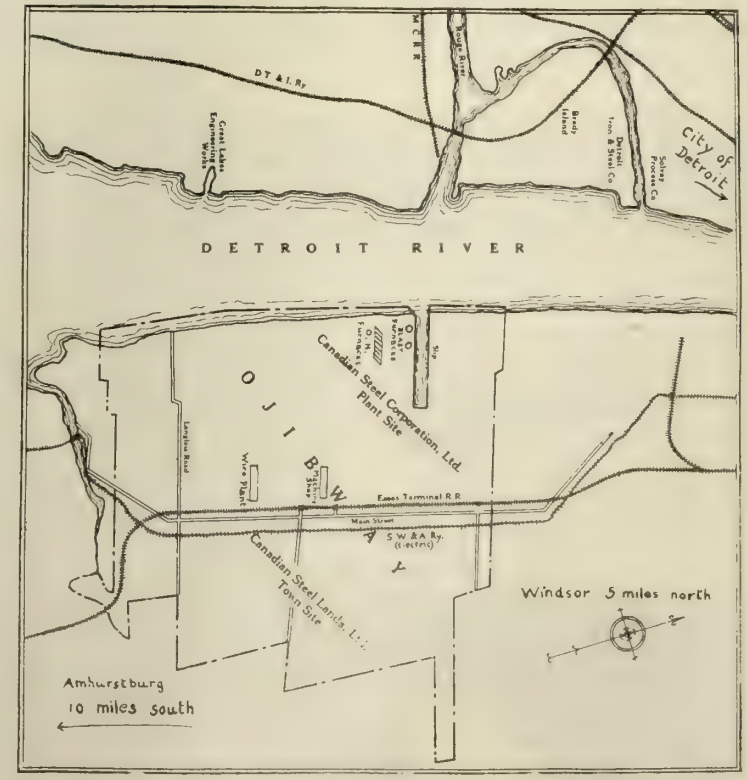
IN the work that is being done by Canadian Steel Corporation, Limited, (subsidiary of the United States Steel Corporation) at Ojibway, five miles south of Windsor, Ont., one must appreciate the vision represented in the scope of the proposed undertaking. It involves ultimately, the expenditure of millions, but it appraises the industrial future of Canada. It glimpses in the perspective a potential market for iron and steel. The proposition seems to develop the fact that, as a first prospect, Canada encourages confidence and presents advantages. Certain facts afford explanation. In the year 1920, for example, Canada displayed unpredecented industrial vigor. Steel production values amounted to $640,233,785; steel imports, $245,625,703 of which $178,661 606 were from the United States. Now, give proper bearing to the country's ownership of great national resources, not the least of which is evident in electrical power, and all of the elements upon which industrial expansion thrives and develops world-wide importance, and the background of the picture is complete. It is the purpose of the Corporation to parallel the future, to make their growth coincident rather than a matter of sudden entry after the forward movement has developed headway.

Property Two Miles Square

Comprising two thousand acres, the property extends two miles along the Detroit river, and practically two miles back. The highway between Amherstburg and Windsor forms a dividing line. To the east is the Ojibway townsite, to the west the site of the proposed steel plant. When the Corporation took over the area some years ago, the post office of Ojibway was included.

Thus, to-day, for all practical purposes, geological or otherwise, the Corporation is Ojibway and Ojibway is the Corporation. The town has a government charter, and is, in every respect, conducted as a municipality with a mayor, and board of commissioners These are appointed by the crown and will so act until an electorate is established. Their duties at present have to do with those matters that relate it to other municipalities. A uniformed police force is maintained on the property.

As planned, the townsite has capacity for a population of 22,000. It should be explained that this property is under the control of a subsidiary corporation—Canadian Steel Lands Limited—that none of it has ever been sold, and that there is none for sale. Operation of the proposed plant will call for homes for employees. It is for this object that



Plan of the Canadian Steel Corporation, property at Ojibway, showing relation of townsite, with capacity for 20,000 people, to that of the steel plant. The property is five miles below Windsor on Detroit River, and is served by electric and steam railways.

this section is being reserved. A plan they have in view is an attractive town layout with a large square, 750 feet long, for municipal or other notable buildings. For some distance surrounding the Corporation property, lots have been laid out by real estate agencies who have done a veritable "land office" business. In these operations, however, the Corporation has had absolutely no part. Dwellings now on the property were there when it was taken over; no new ones have been erected.

When the area was acquired it became advisable, in working out plans, to divert the Windsor-Amherst road, practically one-half mile to the east. Here the Corporation gave new for old. A concrete highway was built, with roads north and south and with the tracks of the Sandwich, Windsor and Amherstburg electric line between, forming a modern boulevard. This work, with all necessary changes in services, was carried out by the Corporation and handed over to the municipalities interested. The road, so diverted, passes through the centre of the property and adds an important link to a thirteen-mile stretch of concrete extending north beyond Ford, Ont. It is now proposed to carry it still further to the south and eventually to Amherstburg on Lake Erie.

Important Work Carried On

Although none of the units as constructed on the steel site immediately west of the town, are equipped or ready for operation, a large amount of work has been done. Most important is the unloading slip, 200 feet wide, 23 feet deep and extending 2,400 feet from the Detroit river; the two blast furnaces, each having daily capacity of 600 tons, the first of fourteen (possible;) the wire plant 162 x 364 and the machine shop, 142 x 340, built to handle repairs in connection with the works. Both buildings are of steel and concrete. In normal season, there are, on an average, about 300 men regularly employed. Large tonnages of steel, water and drainage pipe are stacked on the townsite for proposed services, and large concrete trunk sewer sections have been built on the property. Canadian workmen, industrial institutions and business generally have benefited from the expenditure, to date, of about seven million dollars.

It is an interesting fact that the unloading slip is the first of its kind on the Canadian side north of Lake Erie. As at present constructed it will accommodate six of the largest type of lake freighters—three on each side with sufficient room for a ship to pass between. As the operations of the corporation extend, it will be possible to double the length of this slip. The entrance expands to a width of 400 feet. Massive concrete side portals or lips, on piles of Douglas fir, 75 or 80 feet to the rock, have been built and these have rear ties or braces of concrete on piling. This will be filled in with slag from the furnaces, and other materials. A detail that indicates the corporation's belief in safety first, is the setting of steel ladders in the concrete work at intervals of 120 feet at the entrance and for the entire length of the slip connected by festoons of chain hung at the water's edge in the intersections.

Reaching in from the Detroit River the slip makes it possible for navigators to use the current of the river to advantage in arriving or departing. Coming down, a boat may make the turn and enter the slip head on with plenty of steerage way and without tug assistance. Departing if upward bound the current may be used to swing the stern downstream thus giving clearance with minimum effort.

Modern Automatic Equipment

How important this slip and water carrying service is in relation to the operation of the steel plant is strikingly evident. On the north side will be

WORLD'S BUSIEST WATERWAY

Volume of water-borne freight traffic passing through Detroit River—the "Straits"—affords interesting comparison with that of other famous waterways, and also indicates the extent to which lake and river routes are serving the behest of business. The net registered tonnage passing through in 1919 was 53,664,745 or 10,000,000 tons less than in 1918. The estimated value of this tonnage was $979,423,795. Of the 928 vessels, 113 were Canadian. This does not take into account the passenger boats, tugs or sand scows. One vessel passed every 13.2 minutes. The tonnage through Panama Canal in 1918, a notable year, was 6,131,675, and through the Suez, 9,251,601. One of the earliest and most notable flotillas that entered "The Straits," was that of de la Mothe Cadillac, founder of Detroit, who, in 1701, made the perilous detour by way of Ottawa River, Georgian Bay and Lake Huron, arriving in small boats before the site of the future Auto City, 49 days after leaving Montreal. Danger from the Iroquois made the longer trip advisable.

Bird's-eye view of slip entrance on Canadian Steel Corporation's property at Ojibway. The slip will accommodate six of the largest lake carriers. It is 202 feet wide and 23 feet deep. This view was taken from the top of a 250 foot chimney and shows location of important industries on the American side of the Detroit River.

the coke oven location and here the coal will be unloaded. On the south, provision has been made for the installation of ore unloading equipment. The concrete sub-struction for the massive ore unloaders has its base on the rock and extends the full length of the slip. With a span of 658 feet, the ore bridges serving the ore storage yard will probably be the longest of their kind in the world.

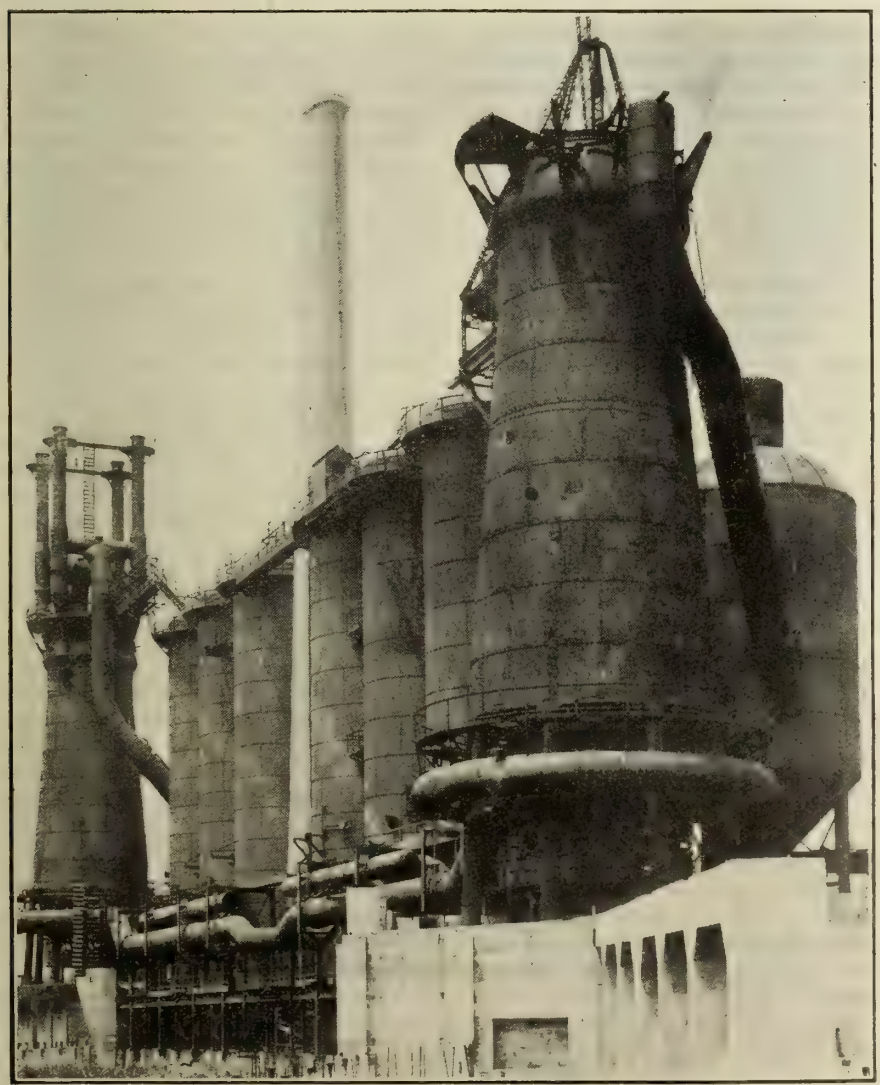
By-product coke ovens, on the north side of the slip, will be served by the Essex terminal railroad, owned and operated by the corporation, and the product thus carried to the furnaces. The entire equipment in connection with the plant is as fully automatic as it is possible to secure, representing the last word in modern practice. The two blast furnaces and seven stoves were fabricated and built by the Canadian Bridge Co., Ltd., Walkerville, a subsidiary of the corporation. They also had charge of the steel construction on the two buildings.

Plans, therefore, show that materials, unloaded on the north, pass southward to the furnaces. Beyond this again, it is proposed to locate the open hearth furnaces and their varied activities. Toward the river there is an area of low-lying land which may be reclaimed and made valuable when built up by the slag and refuse emerging from the plant.

Building of steel and concrete to be occupied by Canadian Steel & Wire Co., Limited, Hamilton, for manufacture of field fence wire. This building will equip this industry to double its capacity.

Accessory Plants

Located toward the eastern side of the steel property, the machine shop, wire plant and so-called accessory buildings appear somewhat apart from the central zone at present. There was good purpose in this, however, the desire being to make these units easily accessible to workmen from the town and to avoid over-proximity to base operations. At present, the layout seems somewhat disconnected but the very extensive plans as proposed will bring all units into proper relationship with the idea of most economic operation. The accompanyng plan reveals this idea. There are also comprehended in the accessory grouping a forge plant, a foundry equipped with electric furnace, pattern shop and storage brick sheds, oil houses, boiler plate shop, electric repair depot, car repair shop and locomotive sheds. Again there is a safety provision in a subway under the highway from the town to the plant grounds.



Two blast furnaces and seven stoves have already been built. The first of fourteen possible. The chimney in the centre is of reinforced concrete 250 feet high. The furnaces have a capacity of 600 tons of pig iron each per day.

An Aerial View

Recently a concrete chimney 250 feet high was built to carry off the combustion products from the furnace plant. Two of the illustrations in this article are from the top of this chimney. One gives a view of the mouth of the slip, the concrete walls bounding the ore storage area on the north, while to the west is the American shore. Here is shown the mouth of the River Rouge, converted into a slip or channel to the Ford blast furnaces and tractor plant. It was here, during the war, that the building of the eagle boats for the United States navy was carried on. Other plants on the American side, directly opposite, are those of the Solway Process Co., Detroit Iron and Steel Co. and the Great Lakes Engineering Co. To the north of the corporation plant on the Canadian side is the plant of the Canadian Salt Co. The underlying rock formation of this section is limestone, and underneath this are extensive salt beds.

Another view, taken from the top of stack eastward, looks down on No. 2 blast furnace, shows also the tops of one of the stoves and of the dust accumulator. Slightly to the right may be noticed a cluster of piles preparatory to the erection of furnace foundations and bases for other structures are nearby.

Built of reinforced concrete, by the Rust Engineering Works of Pittsburg, Pa., the chimney has a diameter of 11 ft. 0 in. inside of lining. The shell will be 15 ft. 6 in. inside diameter at the bottom and of 11 ft. 6 in. at the top. At the base, the thickness is 24 in. and at the top 5 in. It is built upon the same foundation as the stoves and furnaces which consists of concrete on piles driven to rock.

Served by Railway

Railway tracks noticed in these views, are spur lines from the Essex Terminal Railway. This road now runs from

General view of machine shop, which will be equipped to take care of repairs in connection with steel plant.

Ford City to Amherstburg, the corporation having extended it 12 miles from Sandwich to Amherstburg. The road crosses and has connections with the five trunk railway lines serving this busy industrial section. These are the C. P. R., Canadian National, M. C. R., Wabash and Pere Marquette. The E. T. R. is in contact with 120 industrial plants and is self supporting. As the district develops, this line will become a still more important shipping artery.

Frequently questions are arising as to the why and when of the Canadian Steel Corporation's activities. The answer may be said to represent 50 per cent. interpretative vision and 50 per cent. recognition of practical industrial economics. On the one hand is confidence in the future of the Canadian market; on the other there is conviction that such confidence must carry with it preparedness. The growth and development of the country means the increasing importance of the steel industry.

It is felt that the day will come when it may prove to be unsound, economically, to import huge tonnages of finished steel product. The output of the plant as proposed will consist of rails, plates, structural steel, bars, sheet steel, tin plate and tubes. The wire plant will eventually house a subsidiary, the Canadian Steel & Wire Co. of Hamilton, manufacturers of fence wire, and here they will be enabled to double their capacity. Other units and finishing plants will be added as the market requires. There is at present an import duty on such products as the corporation would manufacture, ranging all the way from 15 to 35 per cent. Location in Canada with an assured market has "ground floor" advantages, and then there is the matter of preferential tariffs, with British Colonies as a factor in development of export trade. The corporation is served by its own line of lake steamers under the name of the Pittsburgh Steamship Company, and by an ocean fleet, the Isthmian Steamship Company. It is equipped, therefore, to improve its position relative to the Canadian market and, through the same productive activities, to extend its contact with world markets.

Location of the plant has exceptional advantages as regards supplies of raw materials such as American hematite ores and of metallurgical limestone. The former enter duty free but there is still a duty of 17½ per cent. on limestone due evidently to some misunderstanding of industrial requirements on the part of those who framed the tariff. Importation of coking coal does not constitute a problem because of 99 per cent. refund when used for purposes of Canadian production.

To adjust itself to the future Canadian market is, then, the object behind the proposals of the corporation. When those plans may become directly operative, depends upon pressure of demand and upon attendant circumstances.

Judge Elbert H. Gary, chairman of the United States Steel Corporation, is president of the Canadian Steel Corporation, Limited. Ward B. Perley, vice-president, is in charge of operations on the property. W. H. Baltzell, formerly with the engineering department of American Steel & Wire Co., is chief engineer. E. J. McIntyre is construction engineer. He was formerly with the Republic Iron & Steel Co., Youngstown, Ohio, in similar capacity. W. J. Filbert is secretary and auditor and F. Parrish, purchasing agent. The executive offices occupy one of the large homestead dwellings on the property and this has been remodeled to suit requirements. The location chosen as a site for this great industrial development is, in some sections, one of the most charming along the Canadian shore of the Detroit.

A HISTORIC COUNTRY

Property occupied by the Canadian Steel Corporation at Ojibway, Ont., is located in historic territory. Through it runs the old road between Amherstburg and Windsor. Memories of Brock, Hull, Pontiac and Tecumseh and many others who played prominent parts in pioneer days and passed on, everywhere suggest themselves. The property occupies what was known as Shore Acres, whereon was, at one time, a famous roadhouse. The old building shows the stress of years in spite of its brave showing of massive grey limestone construction. It was evidently built in 1812, as attested by a corner stone bearing a Masonic sign and the legend, "1812, B. C." What the "B. C." means, even the oldest inhabitant refuses to guess, unless it is that the times were so troublous as to suggest that the advent of the second Christian era had been, even then, long overdue. What transformation is the locality to undergo in the next hundred years? The appearance of the American side, with its flourishing mills and factories, might afford a modest idea.

LARGE STEEL PLANT PLANNED FOR WELLAND

WELLAND.—The Electric Steel and Metal plant at Welland, idle these past two years, will be in operation in February, having been purchased by Welland Alloy Steel Company, Limited.

The above announcement which is one of the most important pieces of industrial news of the year, was made by J. Ferguson Black, who has had negotiations for the company in hand for many months. In an interview Mr. Black gave a comprehensive outline of the company, its property, its purposes and its personnel. It is proposed to have rolling mills in operation before the close of 1923, and to employ 2,000 men. It is the intention to increase electric furnace capacity to daily output of 300 tons.

The officers of the company include men who are noted in the steel industry:

G. F. Alderdice, first vice-president of the Brier Hill Steel Company, Youngstown, Ohio. This company operates blast furnaces and open hearths, coke plant, blooming mill, merchant mills and sheet mills. It owns its own coal mines and has a fleet of lake carriers for carrying ores. It employs between five and six thousand men.

W. H. Devlin, for twenty years general superintendent Carnegie Mills, Sharon, Pa. This plant is owned by the United States Steel Corporation and employs upwards of 2,000 men.

H. William Sharpe, first vice-president of the Joliet Forge & Steel Company, of Joliet, Ill. The rolling mills and forge shops are owned by the Sharpe family. The company has reserves in excess of a million dollars.

G. B. Nisbet, M.E.L.C.G., formerly metallurgical engineer for the Brier Hill Steel Co.

H. E. Timmerman, Welland, formerly engineer Hydro Electric Commission.

J. Ferguson Black, mining engineer.

Active management of the industry will be in the hands of Messrs. Devlin, Sharpe, Nisbet and Black.

The company owns 700 acres of nickel lands in Northern Ontario.

The business will consist principally of the manufacture and sale of alloyed and straight carbon steel ingots, billets, rounds, squares, bars and shapes, also high grade electric steel castings. The company owns a patented process for the manufacture of nickel steel. This process has been tested out in commercial production. The reports of the company's engineers have been verified by engineers appointed by interested steel men, and again by engineers appointed by the underwriters.

Solving Problems in Selling Machine Tools

Peculiarities of Demand Must be Studied—Business Cycle in Relation to the Market—Pure Logic to Buy in Times of Depression—Conservatism a State of Mind—Sales Engineers

By ERNEST F. DUBRUL,
General Manager National Machine Tool Builders' Association.

BOTH BUYER and seller of machine tools would profit if they thoroughly realized some peculiarities of the demand for machine tools. The machine tool is an instrument of production whose sole utility lies in saving of time of high priced labor used in producing other goods, or in its making a product of greater accuracy than could be made without it. There is, therefore, no market, no demand for a machine tool at any time or in any place that is not producing or expecting to produce other goods from which the user of the machine tool derives his own income.

Machine tool demand comes from three sources; first, there is wear-out demand, which is quite small because well-made machine tools in actual practice last a long time. The second is expansion demand arising where a new shop is to be started or an old one is to be expanded. Expansion of industry is irregular in extent and in time. The experience of the world shows that while expansion, in the long run, takes place at an increasing rate, this rate is far from regular and goes forward by rapid general movements succeeded by general slow-downs. This condition we have come to call the "business cycle." These movements create much more complicated conditions than if the movement of business were steady. Both buyers and sellers should recognize their existence and the effects they have on the machine tool industry in the various periods of activity and depression.

A third class of demand partakes very largely of the nature of expansion demand. It is obsolescence demand. The machine tool industry is a progressive one, staffed with a corps of inventors who are continually seeking to build machines that will turn out either more work or better work than could be done with an older type of machine. It is a cold fact that the sale of machine tools, whether due to expansion, wear-out, or obsolescence demand, is very largely influenced by the conditions in the purchaser's own establishment at different stages of the business cycle.

PERIODS *of depression in the machine tool business, compared to other businesses are relatively long. Consequently there is a stand-by expense to which the machine tool builder is subject by the nature of his industry. Unless this expense were paid in the long run by its customers, the industry could not exist. He must carry a force of experimenters, designers, inventors, pattern-makers and other similar auxiliaries whose salaries and costs must go to the expense sheet. It is to the interest of both builder and user to minimize as much as may be the costly effects of the marked fluctuation in machine tool demand.*

Effect of the Cycle

In a period of depression, men who have shops full of idle machinery are not very susceptible prospects for a machine tool salesman who attempts to sell them additional machinery. As a matter of pure logic that is precisely the time when the user should buy his machine tools, but as a matter of fact, that is precisely the time when he does not buy them. In times of depression, he has time to plan changes in his methods of production, to look ahead, to revise his costs and get them as low as possible. In such times he could get plenty of labor, working at greater efficiency to do all this sort of preliminary work. The direct costs of labor and material being lower in a time of depression, the machine tool can be and is produced and sold for a lower price. All these would seem to be good and sufficient reasons for the machine tool user to buy his machinery when his own business is depressed.

Since he does not in the mass, make his purchases at such time it is evident that there are some stronger reasons to the contrary. These lie in the financial and mental condition of the buyer himself. His business is depressed and so is his mind. He is filled with a spirit of caution, as well as fear for the future. He does not know how long the depression is going to last and as his financial condition is not the strongest at such times, he holds on to all the cash he can get hold of. Very few business men can so well calculate the future as to be very sure of where they are going to come out.

THE COMPETENT *salesman can be of great value to the sympathetic buyer. Many a time suggestions occur to such a man as he goes through a shop, resulting in cost reduction without additional investment, that has been well worth the time and trouble taken in talking to the salesman. At this particular time, this policy ought to be pursued. "There are many machine tools at work in various shops in Canada and the United States that ought to be sent to the cupola. The buyer pays more by using them than he would pay for new machines."*

Human to Defer

So it is the most human thing in the world to defer purchases of equipment until the prosperity is evident, and one is sure to need the machines, even though he knows he must pay more later on. In every depression it becomes very evident that a low price is not a stimulant to the wide purchase of machine tools. Naturally, the provident, well-informed user, who has both the cash and the courage to make purchases at that time, is able to pick up some very good bargains. If more buyers realized that fact they would benefit themselves by making their purchases in the very depth of depression.

With general improvement in business the machine tool user gains financial strength and gains courage, but it is a human fact that most business men wait to place orders for machinery quite a bit longer than they should. They seem to think that because they could have gotten immediate delivery six months before, they can always get machines just about the next day after placing orders. They wait until their own shops are full of work and even a blind man could see that they need more machinery.

Unfortunately, however, so many do the same that there is a heavy rush of orders into the market just when all the metal working industries are busy. They have about cleaned up the labor market, are probably raising wages; so just when the machine tool orders come in strong, that industry faces the same scarcity of labor to make those machines. The machine tool shop is not a mass production shop; it can make only relatively small quantities of any one thing. Its product requires a high-grade of mechanical skill for proper fabrication. This labor is already at work in the shops of the ma-

chine tool industry's customers. So, the machine tool builder must induce these men to come into his shop at a wage considerably higher than they are getting where they are.

Reason for Higher Costs

The machine tool builder has little alternative but to get his men from the shops of his own customers to make the tools that they require. Only to a small extent can he use unskilled or semi-skilled labor in fabricating machinery of high precision. Even to rebuild the force costs money. A well-knit, well organized force will always produce a given quantity of work in shorter time than a new force. So just when his customers clamor for deliveries the machine tool builder has to rebuild and weld together his labor force with attendant high cost.

The man producing an article in large quantity does not make proper allowance for the higher cost necessarily involved by making similar articles in a small quantity. He compares the price of a machine tool with his own product, and weighs what he thinks were the costs to the machine tool builder compared to the actual cost of his own product. Although he can well afford to pay the price in view of the productivity of the machine, he lets his mind stray away from the earning of his own capital invested in the machine, and worries about the machine tool builder's apparent profit. This attitude is entirely unfair to the machine tool builder. If the user had the contrary idea that the machine tool could not possibly be produced at a profit for the price asked, he would promptly forget the machine's apparent cost and stick to figuring the utility of the machine to himself regardless of its cost. If he could not figure a profit to himself in the purchase of the machine he certainly would not buy it no matter how much it had cost the builder.

Responsibility of Buyers

These are all some human reactions of the buyer that increase the cost to him. If each buyer would act differently machine tools would be cheaper. But few buyers stand off and look to see what they are doing to themselves in the way of increasing the cost of selling and of manufacturing. The operation of machine tool demand with relation to the business cycle involves maintaining a plant large enough to take care of a heavy peak load, and even when the peak of demand is on, the plant may not be large enough to supply immediate wants, and deliveries become more and more deferred. The user himself loses money by being unable to turn out his product, for whose production he has placed his orders for machines. There is a hectic rush all around for a while.

Periods of high activity are relatively short in the machine tool business and periods of depression, compared to other businesses, are relatively long. Consequently, there is a stand-by expense to which the machine tool builder is subject by the nature of his industry. Unless this expense were paid in the long run by its customers the industry could not exist. Because his recurrent demand through wear-out depreciation is so very small the machine tool builder is largely dependent on the expansion and obsolescence demand. He must necessarily carry a force of experimenters, designers, inventors, pattern makers, and other similar auxiliaries whose salaries and costs must go on his expense sheet. All this requires a large capital. Small establishments have not been able to survive as a rule.

It is to the interest of both machine tool builder and machine tool user to minimize as much as may be the costly effects of the marked fluctuations in machine tool demand. The buyer can help himself materially by studying his own conditions, taking advantage of the time when prices are the lowest to place his orders. To do this he will have to anticipate his own requirements as far as he safely can. Certainly the cheaper his machinery the better earnings that machinery will make for him when it gets to work. Buyers have not given as much consideration to this as they fairly could. Long before their own activity develops, buyers should give a sympathetic hearing to the machine tool salesman, provided of course he has something to say.

Salesmen Should Study Conditions

The real machine tool salesman is not a man with a superficial knowledge, but is in the best sense of the term a sales engineer. He should be given the run of the shop especially when times are dull. He should be allowed to study conditions to intelligently recommend new equipment for cost saving production. Of course if the selling agency, whether manufacturer or dealer, puts out salesmen who are not able to offer valuable suggestions along those lines the user will not be bothered with them. The competent salesman can be of great value to the sympathetic buyer. Many a time suggestions occur to such a man as he goes through a shop resulting in cost reduction without additional investment, that has been well worth the time and trouble taken in talking to the salesman. At this particular time this policy ought to be pursued. General business has now reached a stage of improvement that makes it safe to predict continuance for some time to come. Financial conditions are good. While agricultural prices are still somewhat low, continued improvement in European conditions will show improvement in the farmers' purchasing power. Competition is of course keen in every line and the wise manufacturer will use every means to reduce his costs of production. There are many machine tools at work in various shops in the United States and Canada that ought to be sent to the cupola. The buyer pays more by using them than he would pay for new machines. Just because they are still running, however, many machines are kept at work without regard to economy of operation.

The machine tool user should carefully scrutinize his own equipment and at the same time scrutinize the advertising columns of the technical press and pick out what seem to be better machines than what he has. Then he should call in the manufacturer's representative to go over the situation with him. The machine tool industry has always provided machines that made a very good return on the investment, and the present time is no exception.

IN A PERIOD of depression, men who have shops full of idle machinery are not very susceptible prospects for a machine tool salesman who attempts to sell them additional machinery. As a matter of pure logic, that is precisely the time when the user should buy his machine tools, but as a matter of fact, that is precisely the time when he does not buy them.

MOST BUSINESS men want to place orders for machinery quite a bit longer than they should. They seem to think that because they could have gotten immediate delivery six months before, they can always get machines just about the next day after placing orders.

The general increase in building created a much better demand for goods, reports the Port Hope Sanitary. The tendency of prices was lower but then the increased volume more than compensated in the cut in costs. The company had a good year last year and a better one this, while it is generally predicted that the coming year should show another increase.

Manufacture of radio equipment by the Canadian General Electric Company is a new venture which is said to be turning out profitably. While the company, in line with others, had felt the trade depression, prospects were that commercial and municipal construction, continuing to grow, would improve the operations of this concern.

Manufacturers Express Confidence in Future

Individual Reports Are Encouraging—Evidence That Country Has Made Steady Recovery From Adverse Conditions—Lumbering Industry Active—Western Crops Help Create Confidence

REPORTS from Canadian industries as to the past year's operations contain much that is encouraging. There is a pronounced feeling of optimism. In not a single instance is there an evidence of doubt with regard to 1923. Those basic industries that have not been as well employed as they would like, reflect improvement. The iron and steel industry has been one of these. Production during the year reached very low levels, but the year closes with more active markets, and with buyers recognizing that the country's growth cannot be denied.

* * * *

In Quebec, manufacturers report that conditions improve steadily. Here, too, lumbering operations have been extended by reason of liquidation of stocks. Paper production has increased and the market somewhat brighter. Asbestos mines have resumed under more favorable conditions. Furs, hides and leather have had a better year. Firms engaged in iron and steel report a more encouraging prospect. The same may be said of the sugar industry. In textiles the demand has been active, and while the clothing industry has not realized expectations, footwear factories have been well employed.

Industry generally is working courageously out of a period of depression and the prospect is much brighter. There have been bountiful crops and these will prove an important factor in the recovery.

* * * *

Ontario industries, generally, are closing the year in better condition than last year. Lumbering operations are being conducted on a much larger scale. Export and domestic trade will require increased quantities, while the pulp and paper industry will have to meet a strong demand in similar markets.

Development of electric power had an important extension by the completion of the Chippawa enterprise and the installation of three units aggregating 165,000 horsepower. Not only this undertaking, but the equipment of several other important power plants throughout the country indicates an appreciation of industrial requirements. The mining industry has had a record year, and activites have been such as to encourage associated activities, such as the erection of special machinery. The textile industry is also in good position.

Probably the building industry has shown a more remarkable growth than any, and its activities have absorbed not only large amounts of material, but have reduced unemployment to low levels.

Public works by municipalities and provincial government have been carried on extensively. Much highway improvement has marked the year. The Welland ship canal has been proceeded with and large sums have been expended on new schools and other public buildings.

Although farmers have had good crops, prices have been discouraging. It may be said however, that although the year has had its handicaps, industry in Ontario, on the whole, has found reason for viewing the future with sound optimism.

* * * *

Industry in the Maritime Provinces shows tendencies similar to those in other provinces—a steady recovery from adverse conditions which hampered production, impaired markets and made for unemployment. Crops have been good, fisheries had large catches and fairly good market conditions. Old stocks of lumber have been moved and operations assume a more normal aspect, though on a conservative scale. Owing to labor troubles coal output was curtailed but in some departments steel mills are making a better showing. Considerable expenditure has been made on good roads and electric power development.

* * * *

Quantity and quality of crops in the prairie provinces represented a record. The season, with few exceptions, was free from setbacks, and the crop started on its way to market with exceptional speed. Low prices were to a certain extent offset by decreased operating costs and reduced freight rates. The year has demonstrated the importance of high production and of the adoption of means whereby costs may be reduced to a minimum. For the whole of Canada the yield of wheat was not far from 380,000,000 bushels or some 100,000,000 better than last year. Other grains show proportionately greater

gains. Stockmen in the West are encouraged with the prospect of the removal of British cattle embargo.

Mining in Alberta has had some development during the year. Shortage of anthracite has improved the demand for coal, and it is estimated that 75% of the requirements of the prairie provinces will be taken care of from Alberta mines. Six million tons were mined in 1921.

Manitoba is proceeding with important power development. At Great Falls a plant of 168,000 h.p. capacity is being completed.

Western provinces are badly in need of high standard immigration. There are large acreages of untilled land still available.

The good crops came at a time when the money thus placed in circulation will assist in debt liquidation, in the reduction of liabilities and creating more encouraging prospects. Confidence in the recuperative power of the West has been re-established.

British Columbia reports increased lumbering activities, more normal conditions in mining, an exceptional salmon catch, important government works, especially by way of harbor improvements and increasing export trade.

Following are reports from a number of individual industries, nearly all of whom report improvement during 1922 and express confidence in the future:

* * * *

UNDOUBTED QUICKENING IN BUSINESS

By P. FORD-SMITH, President and Manager The Ford-Smith Machine Co.

HAMILTON.—Our total volume of business up to this point of the year is a little larger than last year. The volume of work coming in, however, right now is very much in excess of what was coming in this time last year; the gross volume being about the same because in 1921 we had a fair amount of work not completed at the end of 1920. The machinery business is not good, but there is no comparison between the very dull period at this time last year and the undoubted quickening this Fall.

There have been no extensions to the plant, but we have bought some equipment to cut down the labor cost on our work, particularly on machines for cutting the cost on our large die work. Our only new lines are the extending of our operations on large sheet metal dies and the designing and building of several standard machines which are used in the underwear and hosiery business. We do not pay any bonus plan here, but we gave our employees group life insurance two years ago, on which the company pays the policy entirely.

It is the writer's opinion that business will gradually improve, though it may be two or three years before we are getting all the business we would like. Most of us forget that we enlarged our activities considerably between 1914 and 1920, probably more than the growth of the country in population called for. We have no worries about the future in regard to the machine tool and general machinery business, as long as we can keep ahead in our endeavors to serve our customers and give them satisfaction.

* * * *

DEMAND FOR BALL-BEARING MACHINES

By W. J. MURRAY,
Secretary-Treasurer Preston Woodworking Machinery Company

PRESTON.—This year has been considerably better for us than last year in the matter of volume of business. We have been exceptionally busy in the last three or four months, and have hopes that it will continue. Last year the size of our staff was reduced to about 35 or 40 hands, but we are glad to say now that we are nearing the 60 mark, and propose taking on more if business keeps up. We have made no extensions to our plant, although we hope next year to finish an addition of 100 feet square for which we laid the foundation a few years ago.

We have been concentrating in the last year very considerably on ball bearing machines, with such effect, that in the last few months fully 80 per cent. of our business has been for ball bearing machines. We embody them in all our lines and have hopes that in a few years ball bearings will be standard equipment in woodworking machinery. A couple of years ago we took out group insurance on all our employees, and have continued it. We also have a bonus system in connection with our work, which allows any employee by extra effort to materially add to his wages. Ours is a small shop, and such things as this can't be as well developed as we would like, but the plan we have we find to be of considerable assistance in increasing production.

* * * *

CUSTOMERS SHOULD ANTICIPATE THEIR WANTS

By H.F.E. KENT, President Kinleith Paper Mills.

TORONTO.—The book and writing section of the Canadian Pulp and Paper Association experienced rather quiet business for the early part of the year. It improved gradually up till about midsummer when there was a decided change for the better, and this improvement has held up to the present time. We believe the prospects for the coming year are bright, and while we do not anticipate that it will even come back to what might be called a normal condition after the first of the year, we believe the improvement will be quite noticeable over what we have experienced during the early part of this year.

All mills at the present time are facing the increased cost of production, in view of the fact that the runs are small. Orders are not placed as far ahead as they would be under normal conditions, with the result that the mills cannot lay out the work to advantage. Naturally the frequent changes increase the cost of producing per ton, which, on account of the close competition, means in many cases a loss to the manufacturer. If it were possible for our customers to anticipate their wants well in advance it would enable the mills to not only cut the cost but give a better article.

* * * *

COUNTRY PROSPEROUS —MUCH BETTER OUTLOOK

By E. M. THURBER, Manager Nicholson File Company.

PORT HOPE.—Our business has steadily increased since the low point, reached in the summer of 1921, and we do not see any reason why it should not continue to increase. The country is prosperous and increasing in population, and trade should increase accordingly.

* * * *

EQUIPPED FOR BETTER BUSINESS

By A. T. ENLOW, President Dominion Sheet Metal Corporation

HAMILTON.—In our business the production of Galvanized sheets will run about 2,000 tons excess over 1921 to date and the volume of sales about a quarter of a million dollars beyond the same period last year. We are employing about 100 men this year as compared with sixty-five to seventy last year, the increase beginning in early part of September.

Wages are based on similar rates paid in Pittsburgh-Ohio district and run from about $100 a month for labor to double that amount for an expert workman.

We have added one galvanizing unit to our equipment which will give us when operating steadily a fifty per cent. increase in tonnage, making possible 25,000 ton output per annum.

For three years we have adopted the group system of insurance covering all employees who had been with us six months, beginning with a thousand dollars and going to fifteen hundred as a maximum. One of our staff only has died, being a returned man who had just completed the final payment on his small home and the $1000 was turned over to his widow on Armistice Day, 1921, and came as a total surprise to her.

Fifteen employees hold stock which is fully paid up in every case and cost them about sixty-three dollars per share for $100 par value preferred stock paying 8 per cent dividend.

We have always given a bonus at the end of a year to employees, based upon the value of the individual, in preference to a general or blanket bonus and in addition have assisted about twenty employees to buy or build homes by mak-

ing loans to them which are repaid at stated intervals. We have no securities for these loans and in only one instance has an employee failed to make good in the matter of repayment.

We are all set for a big year 1923 and have every confidence that with our new capacity it will prove the best and biggest year we have ever had and it is our earnest hope that there will be no inflation in either prices or wages.

* * * *

PLANS ADDITION TO FOUNDRY

By H. C. NORRY, Vice-President, The Eureka Planter Company.

WOODSTOCK, ONT.—Our foundry department, during 1921 and 1922 has been kept running to full capacity. We have made an extension during the last few months to our foundry and have plans made for an additional extension as soon as spring opens up in 1923. We have made no reduction in wages in this department since 1920.

Our foundry is run on an open shop basis. We have an up-to-date equipment in every respect which we believe is very essential to obtain the co-operation of our employees; our idea and our aims have been to keep the men satisfied in every way, and as soon as we find an employee otherwise we immediately replace him. At the present time we are running thirty men in this department. A number of these men have been with us since we opened our foundry a number of years ago and as far as we can ascertain every man is well satisfied with his position. We are looking forward to the largest year in our history during 1923.

* * * *

LOOKS FOR GOOD SPRING BUSINESS

By F. H. CROSS, Assistant Manager Hull Iron & Steel Foundries.

HULL, QUE.—The volume of business for the past year shows a decided improvement over the previous year. There has been a considerable advance in the cost of raw materials and in the last few months wages have also risen slightly. We have made no extensions to our plant as our present plant and equipment is large enough to take care of a considerably increased tonnage.

The demand for special heat resisting grate bars, which we originated about three years ago, is increasing rapidly and we look forward to handling a large volume of this special business during the next year. We do not anticipate much improvement in our line of business for some months, but we certainly think that conditions will improve in the early spring.

* * * *

MORE BUSINESS THAN YEAR AGO

By C. H. WATEROUS, Manager The Waterous Engine Works Co.

BRANTFORD.—We have had somewhat more business than a year ago; in that respect there has been an improvement. There has not been any change in the average wage, and there has been no extension to plant or equipment worthy of notice. Neither have we added any new lines, still manufacturing wood pulp machinery and sawmill machinery. With reference to bonus, we only have this in a very moderate degree, and have never had any outside group insurance.

As to the future, it seems to the writer that there will be some improvement unless we have unnecessary government interference, or there is a continuance and extension of the strikes that have taken place, particularly among railway and coal, which would disastrously affect the whole community. The expense of doing business now is so great that a very little addition is liable to throw the whole machinery out of gear.

* * * *

CONFIDENCE IN COUNTRY'S FUTURE

By H. V. HAMILTON, Managing Director Burlington Steel Co.

HAMILTON.—Our business this year has shown a very great improvement over 1921, some of our months being equal to our best in 1920. Recently, however, we have found the demand for steel in general falling off considerably, but we have every confidence that on account of practically no stocks being held by consumers that next year will show a very large improvement over this year. We have all confidence in the future of Canada and look for a gradual increase in business during the next few years. With this in mind we have commenced construction of a number of additions to our mill which will enlarge our output.

* * * *

NEW DESIGNS HELP BUSINESS

"THIS YEAR has been a little improvement over last," states the manager of a large woodworking machinery plant. "The number of hands employed this year is slightly over that of last year. Particularly this last four months. No extensions have been made to plant or equipment. Considerable of the stock that we had manufactured ahead has been disposed of and our stock of finished machines is considerably lower now than it has been for some years and we believe that conditions will gradually improve and we will from now on be gradually increasing the number of employees. We have taken on no new lines, but we have got out a few designs for similar work to those formerly made. These have assisted somewhat in increasing business. We do not adopt any plan of bonus — tried group insurance, but this was not appreciated and was discontinued. We think that conditions generally throughout the country are improving and the future is getting a little brighter."

* * * *

CARBORUNDUM GOOD BAROMETER

By FRANCIS D. BOWMAN,
Advertising Manager Carborundum Company.

NIAGARA FALLS.—We are running 80 per cent. of our normal capacity. Carborundum products are used in practically every known industry. When there is a general depression of business we feel it to a marked degree. In other words, we are pretty good barometers of business conditions. We are now employing 1,800 hands, our normal is 2,000. Wage scale is about 20 per cent. lower than formerly. We predict that business for the first few months of 1923 will be very good indeed. The question of labor shortage should be seriously considered.

* * * *

WILL WANT EQUIPMENT YESTERDAY?

GALT.—Col. A. J. Oliver, secretary manager of R. McDougall Co., discussing conditions during the past year, stated that considerable activity had developed in their pump department. However staff and wages had remained about the same and careful curtailment of overhead expense carried out. No new extensions had been made. It was his opinion that about one year hence, business should make a good showing. As to problems of manufacturing he observed, "You might suggest that in a very short time comparatively many machine operators will be wanting equipment yesterday instead of to-morrow."

* * * *

YEAR'S RECORD INFINITELY BETTER

By CHESTER B. HAMILTON,
President The Hamilton Gear & Machine Co.

TORONTO.—The past twelve months have been just a steady upward grind, infinitely better than the previous twelve because we could see where we were going, which was hardly true before for many firms. Our principal complaint of the previous period was against people afflicted with unreasoning optimism in a slack period. Now we think the reverse is rather true. The volume of business has increased, but what is just as important, it is of a substantial and healthy nature.

The number of men employed has been steadily increased, with wages unchanged. The turnover of employees is very small—practically negligible. We do not have any bonuses or special employees' co-operation systems. Our idea of a factory organization is a hand-picked crew who have been long in the same shop, a fairly high wage rate, and strict standards of quality, production and safety. In the past year we have

had practically no accidents except among new employees, and practically every new man has had to be checked for some kind of recklessness, whether serious accident resulted or not. It seems certain to us that industrial accidents and labor turnover are very closely connected.

You ask for views of the future. The future looks hard, but safe for those who will be careful and work hard enough. It will be a time for nice discrimination both in buying and selling to get service and safety of credit respectively. We do not think it will be a good time for the easy-going, daily-golf-playing executive of "reconstruction" days, who will probably be labeled a bad risk.

We have increased our mechanical equipment substantially, by picking up here and there nearly new machines from firms in financial difficulties. We have not made nor do we contemplate any serious capital investments. A new line which we have taken up is the manufacture of heavy duty motor truck rear axles, of the double reduction type, in sizes from 1½ ton up to 5 ton capacity. Present indications in this line are very favorable. With the prospect of very severe American competition in the cheaper grades, we feel that only in the higher quality lines is the motor truck industry a safe venture.

* * * *

SALES DOUBLED THIRD QUARTER

By H. J. WADDIE, President and Manager Canadian Drawn Steel Co.

HAMILTON.—We found business slow for the first quarter, but it has steadily improved, and in the third quarter, our sales were just double the sales of the third quarter, 1921. As our material goes into a large variety of machines, automobiles, railroad work, etc., we feel confident that trade conditions are much better and will continue to be much better for some time. No one buys our material on speculation as it is all bought for actual consumption.

The price question has been serious and the steady increase in the cost of our raw material has made outside competition heavier; this applies particularly to export orders, but we look for an improvement in this line also and we think that all manufacturers should feel confidence in 1923.

* * * *

BUSY, WITH IMPROVED PROSPECTS

By A. RENDALL, The William Kennedy & Sons.

OWEN SOUND.—We are busier now than we were at this time last year. We have approximately the same number of men employed now as we had a year ago, that is 120. We have not had any noticeable difference in our pay roll, the same averaging about $4,500 for two weeks. We are running nine hours per day six days a week. We have not made any extensions to our plant or equipment nor undertaken the manufacture of any new lines. We have not adopted any plan of bonus or group insurance. The majority of our employees have been with us for years. With reference to our views as to the future, from inquiries received we would expect that business would be better, possibly, than last year.

* * * *

TENDENCY TO LABOR TROUBLES LESS

By W G. SMART, The Smart-Turner Machine Co.

HAMILTON.—The number of men employed has been pretty much the same this year as last but we have not always been able to run full time. There has not been much change in the wage rate.

We have recently absorbed the Hamilton Motor Works and are now manufacturing air compressors, semi-rotary pumps, hand oil pumps and foot valves which were formerly their product. We believe 1923 will show a marked improvement over this year, and we are inclined to think that the tendency towards strikes and labor troubles is less now than it has been for some time. We believe that by an early date the shortage of coal will be remedied and that by spring the shortage of cars will have been overcome. We hope for a great improvement next year.

DOUBLED BUSINESS IN NOVEMBER

By H. POCOCK, President London Concrete & Machinery Co.

LONDON.—Our business during the year 1922 has been about the same as 1921, each of those years being about 20% less in dollars and cents than our business of 1920, which would represent about the same volume. However, we might state that our fiscal year ends on October 31st. To date in the month of November we have done double the business of that of any previous November. We believe that, inasmuch as stocks throughout the country are about all sold out, and building operations are becoming quite active, there will be a revival in our business. We are looking ahead for a big business next year.

* * * *

FIGURES SHOW STEADY ADVANCE

By Malcolm R. Meldrem, President Herbert Morris Crane & Hoist Co.

NIAGARA FALLS.—Our business is showing steady and healthy improvement. Beginning a year ago and taking successive periods of three months, the figures show a steady and gratifying advance. I attribute this satisfactory position to a gradual improvement in general business conditions, coupled with the fact that we have regularly and promptly adjusted ourselves to changing conditions, regulating our prices in accordance with the possible reduction in the cost of our standard manufactures, and aiming always at giving our customer the fullest possible value for money. We are hoping and preparing for a continuance of the improved sales turnover I have already referred to, and I have no reason to doubt that it will be forthcoming. Canada is obviously in the position of the most favored nation today, and the Canadian people should take their courage in both hands and step right forward into normal business.

* * * *

BUILDING LARGE PAPER MACHINES

By G. E. BELL,

Assistant to Vice-President Dominion Engineering Works.

MONTREAL.—Owing to the increased activity in the paper industry, we have been fairly busy during the past year and have under construction several large paper machines for Canadian mills. The outlook in this line of business is good and it is expected that several other machines will be ordered within the next few months, of which we hope to obtain some.

In our hydraulic machinery department, we have also been busy, having obtained the contract for several turbines of varying sizes. The two 28,000 H.P. units for the Manitoba Power Company are now nearly completed, but we have recently obtained the contract for four large units and two exciter units for the Cedars Plant of the Montreal Light, Heat & Power Consolidated, together with several smaller turbines for other customers.

* * * *

NORTON PRODUCTS IMPROVE POSITION

By R. C. DOUGLAS, Manager Norton Company of Canada.

HAMILTON.—Our business this year has shown a great improvement over what we have had for last year, due to the general improvement in the manufacturing conditions, more especially to the automobile trade and in the manufacture of tools for the lumber trade.

We would consider that we are employing slightly under a normal force and that the wages are lower than they have been, but likely to go up rather than down.

The outlook for the coming year is uncertain. We anticipate that the agricultural machinery and allied lines will become quite busy, and if so we look for a very good year.

The principal problem as it appears to us is the question of immigration, which should be actively encouraged if the general conditions are to improve in Canada.

EFFICIENT LABOR REDUCED COSTS

By F. J. CAMPBELL, General Manager Canada Paper Co.

WINDSOR Mills, Que.—Replying to yours of Nov. 24, business has been reasonably active in paper throughout the year, though somewhat erratic at present. Owing to increased efficiency of labor and reduced costs most of the mills have made fair profits. The recent increased cost of raw material necessitating higher prices has reduced the demand and rendered the market very spotty. The market for next year can hardly be considered hopeful until the present state of Europe improves.

* * * *

REPAIRED U.S. FREIGHT EQUIPMENT

HAMILTON.—Referring to activities of the National Steel Car Corporation, an official states:—As no new equipment orders were placed by Canadian Railways during the past two years our ordinary productive volume of business decreased, but this situation was relieved to some extent by our taking on export orders from the United States for repairing United States freight equipment.

No special extensions were made to the plant or equipment as its activities have been practically confined to its general lines, that is, the manufacture of all kinds of freight and passenger railway equipment, motor trucks, drop forgings, etc., for which the plant is equipped in a modern manner.

* * * *

HAVE INTRODUCED ADDITIONAL LINES

By RICHARD CORBETT, Manager Corbett Foundry & Machine Co.

OWEN SOUND.—Regarding our business in general, there is nothing of special mention as business in marine machinery has been exceptionally quiet and we do not expect it to revive along this line for two or three years owing to the market being flooded with ships and owing to strikes, wars, etc., which have a very bad effect on business. However, we are not pessimistic and it is our intention to go into other lines of manufacture. We have just completed a new glue spreader and mixer for veneer work in furniture factories. This is the first machine of its kind manufactured in Canada and is giving satisfaction. We have also installed a new Fox Grinder for re-grinding motor car cylinders and furnishing new pistons and rings. This helps to keep some of the men employed and is developing into quite a business.

* * * *

DEMAND INCREASING SINCE SPRING

By JAS. ARNOLD, General-Manager Canada Foundries & Forgings.

BROCKVILLE.—We have found business very much better during first nine months of 1922 than during the similar period of 1921. Early this spring a change for the better was noticed and this has gone on increasing and we think will be fairly well maintained over the winter months, and we cannot see why business should not be really good by next spring.

At Brockville and at our two Welland plants shipments have materially increased this year and we feel that the country is gradually settling down and developments long held in check are beginning to come to life again. Competition in all lines continues very keen and owing to advancing prices of raw material, revisions of prices are becoming frequently necessary.

* * * *

CONTRACTS RUNNING INTO NEXT YEAR

By C. H. TALLMAN, Manager Tallman Brass & Metal, Limited.

HAMILTON.—Business during 1922 has been gradually improving and the prospects for the balance of the year are much better than former months. 1923 will be decidedly better. We have contracts running well into the year and from reports general trade is much brighter. Our die casting department is very busy and other departments are feeling the effects of the fall improvement. Labor is plentiful.

McCLARY'S APPROACH NORMAL; PROBLEMS DEMAND SOLUTION

By J. M. GUNN,
Assistant General Manager The McClary Mfg. Co.

LONDON, Ont.—The basic raw materials of our industry consist of sheet iron, both black and galvanized; pig iron; copper; spelter; tin and tin plates. It was expected that there would be a general decline in values during 1922, towards pre-war prices, but, on the other hand, there has been a general advance, though not a large one; and we have not advanced our manufactured goods to correspond with these increased values. It is quite possible that this will have to be done in the near future. The reason for this secondary inflation is the increased cost, occasioned by the scarcity of coal, and railway troubles, owing to refusal of the miners and operators to take their share of the liquidation which is going on.

During the year our trade was increased in volume considerably, but the value was not very much greater than the year before, owing to lower prices, and it was done at a narrowing margin of profit. It is hard to say how long the present conditions will prevail but there is not likely to be much change during the first quarter of the year. An advance is predicted in some lines of raw materials which will certainly affect our costs, but if an amicable settlement is made with the labor elements above referred to, this anticipated advance may be avoided.

The conditions of employment were considerably improved during this year, as the first part of the year we were running about 65%; whereas now conditions are more nearly approaching normal.

The elimination of the Marking Act has been detrimental, as imports are coming from European countries and when placed on the market the public are unable to determine the source of manufacture.

We look for good trade in 1923, but before a normal condition is reached the farmer must be able to obtain better prices for his product, and the labor situation must be cleared up; it must take its share of the general liquidation. This refers particularly to the miners and railway operatives.

* * * *

LARGE EXPORT BUSINESS PLANNED

By F. E. MUTTON,
General Manager International Business Machines Limited.

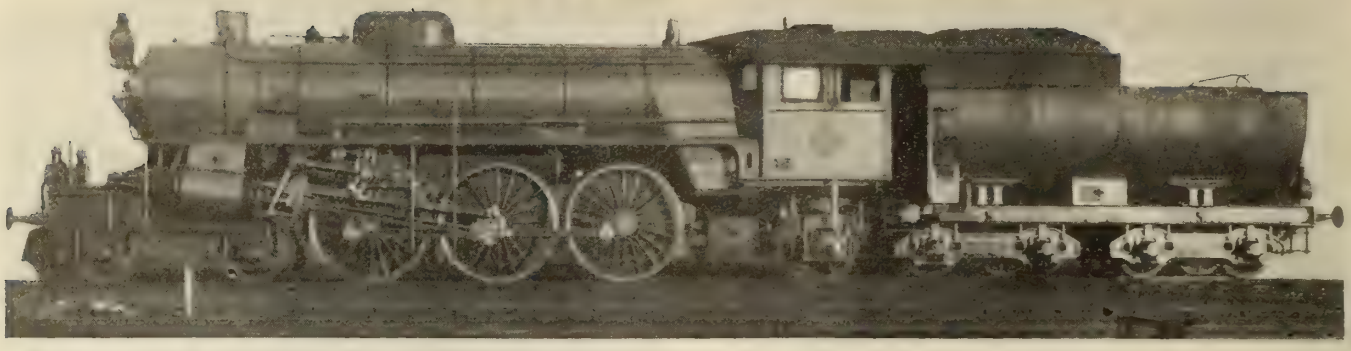
TORONTO.—Our Hollerith tabulating and sorting machine division has had the biggest year in its history, showing an increase of some 20 per cent. against any year and some 30 per cent. increase against 1921, and we have a very large volume of business already in sight for this division for 1923, indicating the large corporations who lease these machines from us have developed the necessity of a greatly increased number of records, which these machines mechanical classify.

The time recorder division has shown quite an increase in school equipments and while the year will show a decrease against 1921, yet the last four or five months of 1922 show a gradual increase against the same month last year and we know of a great many firms that are contemplating installing our equipments.

The Dayton scale division is holding its own against last year and notwithstanding the economic conditions in the retail trade are not as good as they were in 1921. The retail merchants have apparently suffered severely, particularly in the last four or five months, owing to business conditions but notwithstanding that, we have been able to keep our factory running almost normal.

* * * *

Extensive plans are being made in the West against strike trouble anticipated for next spring. Agreement with the United Mine Workers expires March 31, and owners are declaring that they will not enter into another agreement on the same basis. It is claimed that production costs are so high that the price to the consumer is stilting the mining industry.



Strenuous Railroad Year With Prospects Brighter

Economies Observed in Those Departments Which Affect Outside Industries—Revenues Declined Owing to Lower Freight Rates—Cuts Applied to Maintenance Charge—Heavy Grain Traffic—Revenue Ton Miles Increase

RECENT railway statistics throw an interesting light upon a question that is uppermost in the iron and steel industry—that of expenditure in maintenance of way and structures and also of equipment. Now that Sir Henry Thornton, the new head of the Canadian National Railways, has assumed charge, an early announcement with reference to long-deferred activities may be expected. It will likely follow upon his completion of an inspection of terminals and a consideration of available equipment in relation to the requirements of the country. One of the most interesting statements that he has made since his arrival is with reference to electrification of those sections for which electricity may be easily secured. Some comparison with the coal, in these remote parts of the system, will undoubtedly be carried out. It is known that the new head is determined to introduce economies where such are feasible in order to convert the people's lines into a paying proposition—or as close to it as it is possible under present conditions.

It may be taken for granted that the C. P. R. will be one of the interested parties, and that factors of efficiency will be quite as keenly developed in that quarter. The element of competition has been known, before now, to develop phases from which business generally has derived some benefit. Both systems in view of inactivities during the past two years are likely to apply considerable sums in track improvement, and in betterment of rolling stock.

Marked Decline from Peak Year

In the matter of revenue as in that of operating expenses 1920 was the peak year. There was considerable shading off in 1921, while during the present year slightly lower levels have obtained, with a decided improvement during the heavy grain-carrying months from mid-August until November. September is probably the most interesting month in the year so far as railway operations are concerned, as it is then that the results of the country's agricultural effort become evident. Total operating revenues for this month, 1922, amounted to $41,817,612 as against $43,258,401 in the same month last year. Of this amount freight amounted to $29,632,335 which was $713,909 less than the year preceding. Passenger traffic also declined in that month from $8,060,005.29 to $7,746,-015.76. As a whole, the railways showed an increase of $374,-427,779 in revenue ton miles or in the number of tons carried one mile, or 14.2 percent. The decrease in receipts noted above, however, was almost entirely due to lower rates. The average receipt per ton mile in September was .932 cent as against 1.148 cents in September, 1921. This average is greatly affected by the relative amount of grain, coal and other low rate commodities carried. The October record is lower with a heavier movement of grain and coal. Passenger traffic and revenues showed declines and total was $1,-440,789 below those for last year.

Maintenance Expense Cut

It will be interesting to the steel trade to learn that operating expenses showed a reduction of $2,426,888, the cuts being practically all in maintenance expenses. Transportation expenses increased $668,663 or 4 per cent. with the increased traffic and freight train mileage, the latter increasing 9.7 per cent. The average net tons per freight train mile increased from 551.4 tons to 569.9 tons, but the average

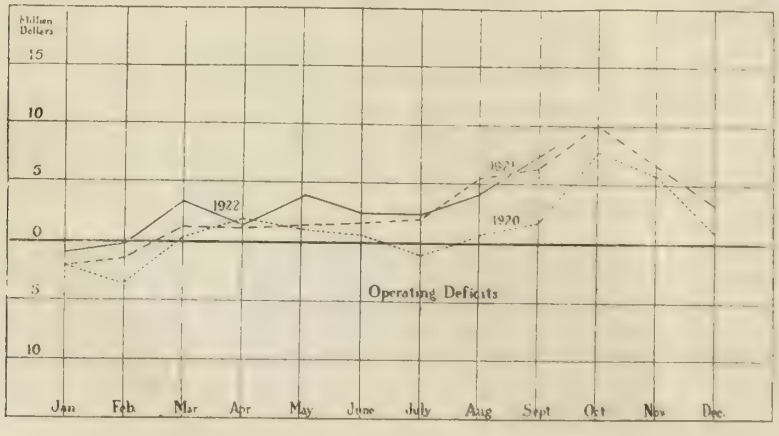


Chart shows where Canadian railroads have stood in the past three years with regards to deficits. It will be noticed that, on the whole, 1922 has made a stronger showing and finishes the year trending toward a higher peak.

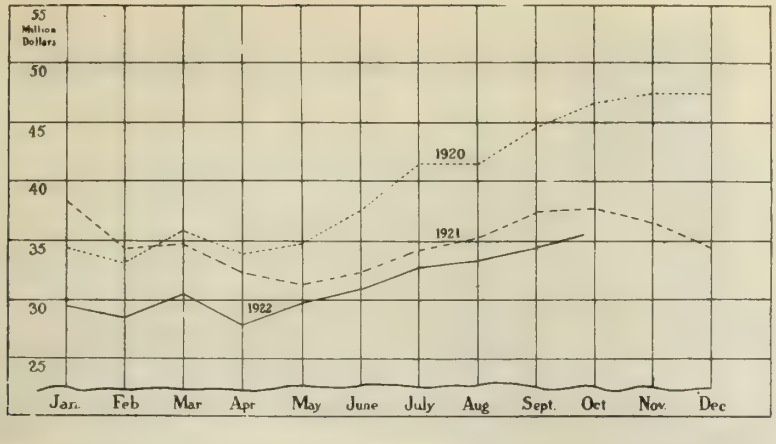


Operating expenses of the railways during the past year have followed lower levels than during the past two years, the cuts being chiefly in maintenance expenses. It is evident that 1923 will see much more activity in rolling stock construction, repairs and general efficiency work than has been evident for the past two years. It is stated that the year's supplies already proposed for the National lines will run over the fifty million mark.

load per car was .9 below last year's average. Increases in coal movement will raise these figures.

Explains Buying Inactivity

Several items may be cited as reflecting the general inactivity in railway work from which considerable benefit accrues to industry. In maintenance of way and structures, during the busy month of September for example, the expenditure was less than that of last year by $1,401,117. In maintenance of equipment there was a falling off in that month of $1,097,676. The Canadian National Railways expended a trifle less than last year, or $101,462 in maintenance of way and structures, while in maintenance of equipment the amount was less than September of last year by $788,730. The Canadian Pacific expenditure on maintenance of way and structures in September was less than last year by $456,339, while on maintenance of equipment they were less by $1,008,102. The reduction in operating expenses on the Grand Trunk Railway also was strongest in those items which bear a relation to outside industry. On maintenance of way and structures the reduction amounted to $712,918, while on equipment maintenance the reduction was not pronounced, only amounting to $16,995.

On the Canadian National, as distinct from the Grand Trunk, expenses increased $221,485, or 2 per cent., over September, 1921, but the freight traffic increased from 863 million revenue ton miles to 1,161 millions, or 34.6 per cent., increasing the revenue $570,278, or 6.8 per cent. This more than offset decline in passenger, express and other revenues, giving an increase of $356,509, or 3.1 per cent. in total revenues.

Freight traffic loading increased from 521 net tons to 604.7 net tons, while the average load per freight car increased 1.1 tons. The average receipts per ton mile were .769 cent, as against .969 cent in September, 1921, and 1.140 cents in August, 1922.

The effect of recent reductions in rates was not so marked on the Grand Trunk as on the transcontinental lines; the average receipts per ton per mile were 1.328 cents, compared with 1.338 in September, 1921. Total revenues decreased $209,838, but expenses were reduced $937,328, giving an increase in net operating revenues of $727,489 and an operating ratio of 87.86 per cent., compared with 98.23 per cent. in September, 1921.

C. P. R. Reduced Expenses

The C. P. R. also benefited from the increased traffic. Revenue freight ton miles on the C.P.R. increased from 763 millions in August to 1,277 millions, or over 67 per cent., and also increased 9 per cent. over September, 1921.

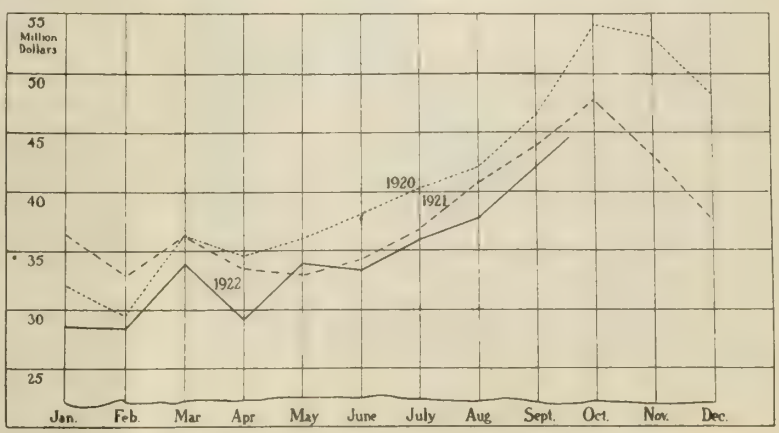
Although revenues decreased with the lower rates, the full effect of the reductions in rates on grain and coal being felt, the operating ratio was reduced from 81.96 per cent. in August ratio of 87.86 per cent., compared with 98.23 per cent. in September, 1922.

Revenues on the C.P. R. declined $1,549,159, or 7.8 per cent., and expenses were reduced $1,591,388, or 10.4 per cent., increasing the net revenue $42,229. The average receipts per ton mile declined from 1.157 cents in September, 1921, to .989 cent. Passenger traffic showed a sharp seasonal decline from August and was 1.3 per cent. lighter than last year, with the revenues showing a decrease of $431,824, or 11.3 per cent.

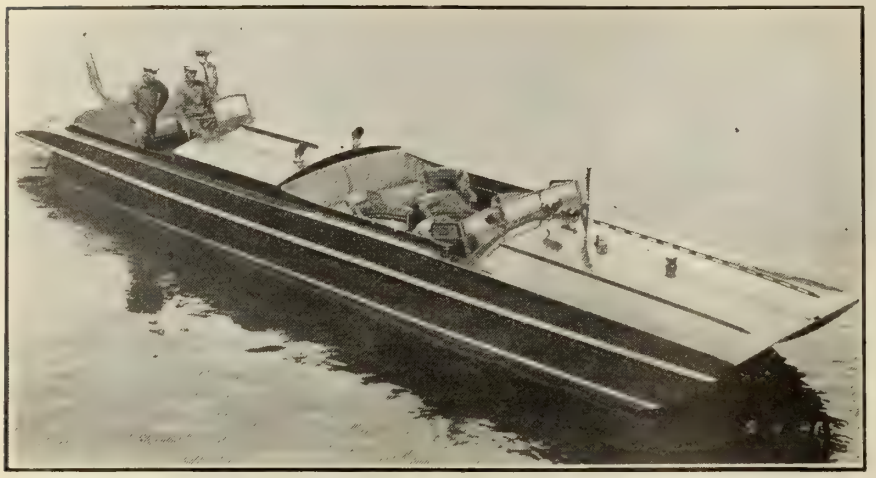
It is reported that the November output of the International Nickel Co. passed the 2,000,000-pound mark and that there is an increasing demand from the steel industry for the products of the company. The output of monel metal from the new mills at Huntington, W. Va., is around 500,000 pounds monthly.

The distribution of something like $50,000,000 throughout Canadian industry for material, equipment and supplies for the Canadian National Railways will go a long way toward developing a prosperity that has been somewhat lacking in many plants especially equipped for railroad work. Tenders for large amounts have recently been called and, while many of these may not lead to actual orders immediately, it is stated sufficient will be released to give the year a propitious send-off.

Total railway revenues for 1922 are shown to be below those of last year. The average receipt per ton mile in September, when grain and general fall traffic gave added impetus, was .932, against 1.146 cents in Sept. 1921. A more intensive policy is likely to follow the re-organization of the National lines, in connection with which the electrification is proposed for sections that are in contact with the more thickly populated portions of the country. C.P.R. policies also point to similar development.



Few Ships Built But Prospects are Promising



Sea-sled built by Canadian Vickers, Limited. This is a new type of inverted V-bottom hull, driven by surface propellers. Photo shows 36 ft. 6 in. sled, with speed of 40 miles an hour.

Activities in Canadian Shipyards Not Extensive — Outlook Is Encouraging—Some Distinct Types Turned Out—Canal Statistics Show Increase

COMPARISON of the past year's operations in the shipbuilding industry with those, say, of 1920, does not make the most gratifying kind of reading. Outside of reports, very little was done in Canadian yards. While in 1920 there were 81 shipbuilding plants reported as active, the present year has seen a large proportion of these non-existent. Such are the fortunes of war. As early as 1920, in fact, the shipbuilding industry decreased by something like $31,675,073, and since then there has been a process of elimination which finds whatever business there may be, largely in the hands of plants which were well established before the war. As to the future, the recent remark of a prominent shipbuilder would seem applicable: "To predict anything in connection with the shipbuilding industry in Canada, would require a far better prophet than I am. There will be an occasional ship for Great Lakes traffic. There will be special boats for special purposes as in the case of the 'Charles Dick,' built by the Collingwood Company during the year. The government will require a boat occasionally, and as the industry of the country develops, boats will be called for. The country's future must take waterways into consideration, and export must increase. Completion of the Welland Ship Canal will help to emphasize the importance of large ship passage to the sea. This may cause a quickening of the ship-building industry. Competition with the Old Country yards is a serious factor, but with an equalization of all conditions, colonial ship builders may have a better chance. It was undoubtedly because of lower production costs that a number of boats for Great Lakes traffic were placed recently with British yards. On the other hand, it is stated that German yards are becoming serious competitors of Old Country builders, and have already picked off a number of important contracts."

Some Comparative Figures

Referring to the world's shipbuilding, and affording a comparative slant as regards England and her Dominions and other countries, including United States, Lloyd's Register recently issued the following facts:

1. Counting only ships on which work actually is in progress, the United States is led by England, France and Holland, with Japan and the British Dominions right on the heels of the United States.

2. The United States is now building only 6 per cent. of the world's tonnage; England is building 60 per cent. and the other maritime nations 3 per cent. combined.

3. This country now has only 150,000 tons of ships in the yards; has not contracted for any new ones since last July 1, and has largely suspended work on those already on the ways.

4. America's decline since the post-armistice peak of vessel construction has been 4,036,000 tons—a goodly percentage of the decline for all the world, which aggregates only 5,346,000 tons.

5. Her shipyards are building only one-third as much tonnage as they were a year ago. Great Britain's are building one-half.

6. America is building today only 2,000 tons more of freight bottoms than she was at the outbreak of the World War in July, 1914; all other nations taking into account the wholesale suspension of building, during the last three months, aggregate 919,000 tons above the pre-war construction totals; Great Britain is building 1,200,000 tons compared with 1,750,000 she had under way in July, 1914.

Vessels Registered in Canada

Statement showing the number of vessels and tonnage on the registry books of the Dominion on December 31, 1921:

	Sailing Vessels			Steam		
	No.	Gr. Tns.	N. Tns.	No.	Gr. Tns.	N. Tns.
N. Brunswick ..	607	29,117	28,126	252	18,405	12,330
Nova Scotia	944	111,957	99,565	606	87,325	53,896
Ontario	450	125,937	133,394	624	64,467	160,614
Prince Ed. Is. ..	106	6,745	6,309	31	7,036	3,257
Saskatchewan ..	1	145	145	4	534	302
Manitoba	14	3,877	3,877	72	8,503	5,722
Yukon				4	1,204	813

During 1921, there were built in Canada 51 wooden sailing vessels with gross tonnage of 11,128; 32 wooden steam vessels, tonnage, 4,629; 74 gas vessels, tonnage, 1,509. There were 24 metal steam vessels with a gross tonnage of 92,722 and net tonnage of 55,917.

* * * *

INCREASING TRADE WILL BRING IMPROVEMENT IN SHIP-REPAIRING

By P. L. MILLER, Canadian Vickers, Limited.

MONTREAL.—Our activities during the past year may be summarized as follows:

Shipbuilding.—Completed hopper bucket dredge No. 16, 284 feet long by 48 feet beam by 20½ feet draft; fitted with twin screw triple expansion engines of 2,000 I.H.P.; speed, 9 knots; gross tonnage, 1,964 tons; for Department of Marine and Fisheries, Canada.

Constructed steel pontoon lock gate lifter for service in Sault Ste. Marie canal, for Department of Railways and Canals, Canada.

Commenced construction of hopper barge No. 3, 210 feet long by 35 feet beam by 19 feet draft, with triple expansion engines 1,250 I.H.P.; hopper capacity, 1,250 tons; for Department of Marine and Fisheries, Canada.

Str. "Charles Dick" built by Collingwood Shipbuilding Co., for a firm of sand and gravel contractors. See description in this department.

Also a number of sea sleds—a new type of inverted V-bottom hull driven by surface propellers—which possess many advantages over any other type of motor-boat. Photograph is of 38′ 6″ sea sled, speed 40 miles per hour, which aroused interest during demonstration trips at Montreal, Toronto and Quebec in the fall months.

Ship-repairing.—During the navigation season, 56 ships were docked and repaired. Repairs afloat were also executed on 150 other ships.

Industrial engineering.—The work in this department includes the following contracts: 36 mine cars for Teck-Hughes Gold Mines, Ltd.; one Hardinge ball mill for McIntyre Porcupine Mines, Ltd.; 8 pressure still drums of steel plate 2″ thick, for working pressure of 350 lbs. per square inch, for Imperial Oil, Ltd.

The average number of men employed during the past year is 450.

With the exception of the above small vessel for the Government, no new ship construction work has been booked by this company, and practically the same condition applies throughout Canada.

Improvement is looked for in the ship-repairing business during 1923, due to the increasing international trade passing through the port of Montreal.

* * * *

THINKS OUTLOOK BRIGHTER FOR CANADIAN SHIPBUILDING

By JOHN S. LEITCH,
Vice-President Collingwood Shipbuilding Co.,

COLLINGWOOD.—The steamer "Charles Dick" is the only steamer which we completed this year. At both our Collingwood and Kingston plants we have had a large volume of repair work and have now a number of vessels in for this winter's repairs. Business therefore will be good as far as repair work is concerned. We are about to start work on a canal-size steamer, which will be ready for spring delivery.

The outlook generally for shipbuilding, we believe, is brighter. The probability is that a number of 10,000-ton type upper lake freighters will be built in the near future, the movement of this year's record grain crop showing that there is room for more tonnage. Following are particulars of the "Charles Dick."

Particulars of Steamer "Charles Dick"

Built for National Sand & Material Company, Ltd., Welland, Ontario, this steamer is the only one of her class ever built in Canada and is the last word in ships of this type. She is equipped with special pumps for loading sand and gravel and with special equipment for unloading in the shortest possible time. The ship is quite an acquisition to Canadian tonnage.

Following are the vessel's dimensions: Length over all 258 ft.; length between perpendiculars 250 ft.; breadth moulded 43 ft.; depth moulded 20 ft.; gross tonnage 2,015; deadweight 2,650; capacity of cargo department 2,000 cu. yds.

The vessel was built of steel to the requirements of the British Corporation for the Survey and Registry of Shipping. The machinery, consisting of one triple-expansion engine having cylinders 19 in., 32 in. x 36 in. stroke, and 2 boilers 14 ft. 7 in. dia. x 10 ft. 8 in. long, is placed aft. Cargo is carried in two compartments amidships and is fed into these by means of a trough with discharge openings at intervals. At each side of the cargo compartments are buoyancy spaces, closely sub-divided by watertight bulkheads. Water ballast is carried in double-bottom tanks under the machinery in peaks and in peak tank forward.

Gravel is loaded by means of two 18-in. pumps located forward. The suction pipes are connected to shell plates about 4 ft. 6in. above keel. The shell is recessed in way of suction inlets so that vertical slides for flanges of pipe elbows will not project beyond moulded line of ship.

Unloading is carried out by means of a grab bucket carried on "A" frames. This bucket discharges into hopper amidships which in turn feeds an elevator. The cargo falls from the elevator to a conveyor which lands it on dock.

The Captain and crew are accommodated forward and the officers' dining room, galley, etc., are housed aft.

Although production in agricultural implements during the past year has been considerably below normal, with comparatively limited export, the next year has its possibilities. The Massey-Harris Co., Toronto, have been increasing their force, particularly in the foundry, and it is anticipated that the plant will be running full by February.

(From Industrial Digest.)

Welland Ship Canal Great Lakes-to-Ocean Link

Work on Stupendous Engineering Project Carried on Vigorously During Year—About 2,000 Men Engaged—Will Be 25 Miles Long With Seven Liftlocks—Over Thirty Millions Expended

By ALEX. J. GRANT,
Engineer in Charge.

DURING the year construction work on the Welland Ship Canal has been carried on vigorously on Sections 1 to 5 inclusive, which are now under unit price contracts. J. P. Porter has the contract for completing Sections 1 and 2; Peter Lyall & Sons Construction Co. for Sections 3 and 4, and the Canadian Dredging Company for Section 5. These Sections extend from Lake Ontario entrance to Port Robinson, about 14½ miles in length, and include all the lift locks and most of the other important structures. No construction work has yet been done on the remaining portion of the canal extending from Port Robinson to Lake Erie.

During the current year, on Sections 1 and 2, nine of the large concrete cribs required for the docking at Port Weller harbour, Lake Ontario, were constructed and placed in position. The harbour is being dredged and the embankments on each side are being built with excavated material. Concrete is being placed at Locks 1 and 2 and their weirs, and these structures are nearing completion. Excavation work is being carried on in the canal prism south of the Queenston Road and to some extent elsewhere on the sections. About 820 men were employed during the year, but the force is now somewhat reduced owing to curtailment of concrete work with the approach of winter.

On Sections 3 and 4, excavation of the canal prism north of Lock 4 and throughout the greater part of Section 4 is being done. Concrete work is well advanced on Twin Locks 6 and a small amount has been done on Lock 7. The re-location of the Welland Division of the Grand Trunk Railway on Section 4 has been graded, ballasted and track laid and operation over the diverted line will probably begin in April, when it is expected a couple of necessary structures will be completed. About 840 men have been employed on these sections during the year.

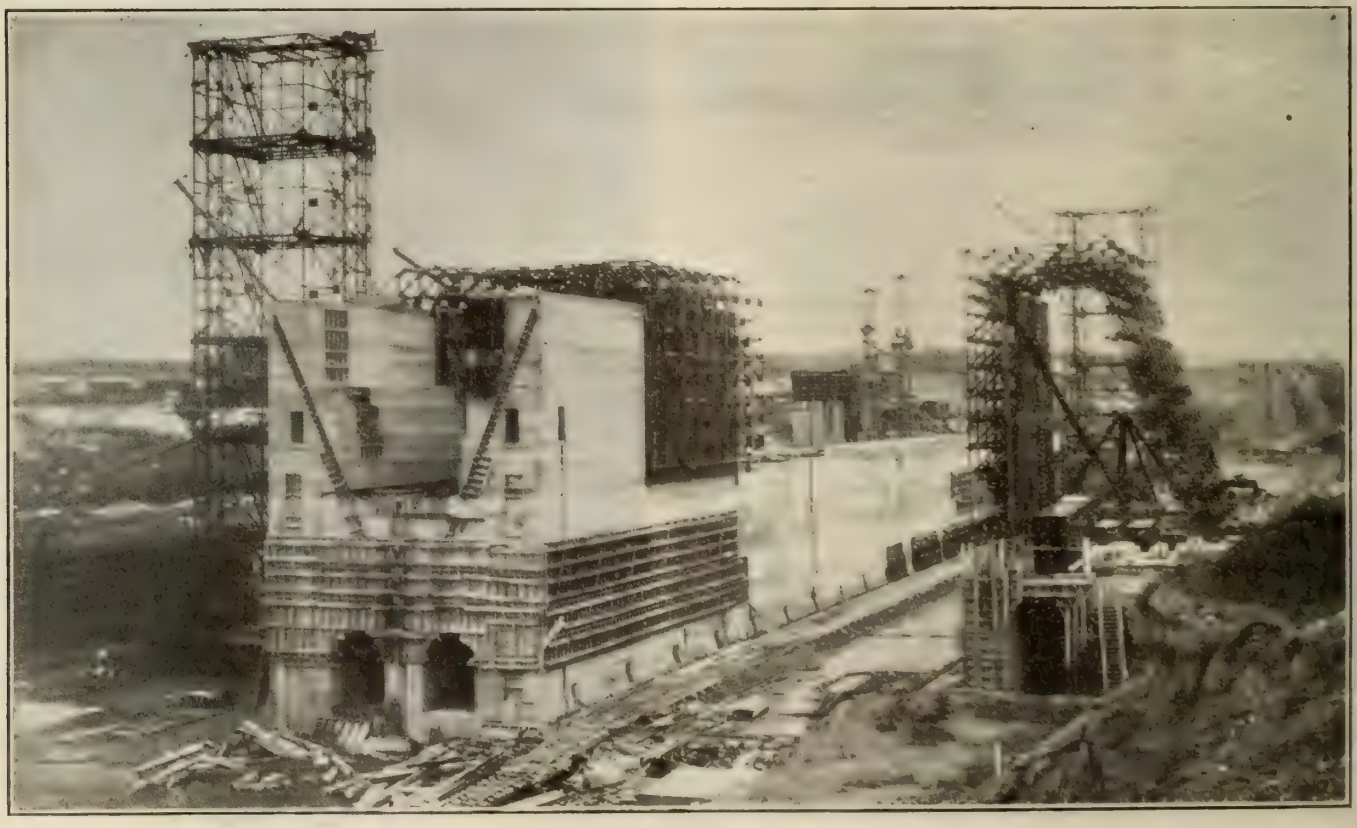
On Section 5, dredging operations are being carried on and the substructure of Bridge No. 12 is nearing completion. This section is nearing completion. About 170 men represent the average number employed during the current year.

The Parliamentary Appropriation for the fiscal year ending 31st March, 1923, amounted to $8,000,000 and about $5,000,000 of this has been spent to the end of November.

Details of Ship Canal

The Ship Canal as finally located, follows the valley of the Ten Mile Creek between its mouth (Port Weller) about three miles east of Port Dalhousie, and Thorold, crossing the present canal below Lock No. 11 where the level of both canals will be at an elevation of 328.0. Between Thorold and Allanburg a new cut will be made for the purpose of straightening the alignment of the canal between these points.

The Ship Canal will cross the present canal below Lock No. 25, where the water levels of both canals are at elevation of 568.0, the extreme low water level of Lake Erie. From Allanburg to Port Colborne, it will follow closely the course of the present canal. The total length of the canal will be 25 miles, and for all practical purposes of navigation, it is a straight line throughout. The difference in level between the lakes will be overcome by seven locks of 46½ feet lift each. The direct line of the canal down the face of the escarpment, and the topography of the lower pla-



Welland Ship Canal—Lock No. 6, showing completed section of centre wall.

teau permitted the adoption of these high lifts which constitute a peculiar feature of the design of the canal and has no precedent in actual construction for locks of their size.

The canal will be made 200 feet wide on the bottom, with two to one slopes and, for the present, will be excavated to a depth of 25 feet only. All structures, however, will be built for 30 feet depth, so that the canal, at some future date, can be enlarged by simply dredging out the canal prism and harbour entrances.

Some of the dimensions and notable features of the canal are as follows:

Number of lift locks (Three of which are twin locks in flight similar to the Gatun Locks of the Panama Canal).	7
Useable length of locks	820 ft.
Useable width of locks	80 ft.
Depth of water on mitre sills	30 ft.
Lift of locks	46½ ft.
Height of lower mitre gates	82 ft.
Width of bottom	200 ft.
Width at water line	310 ft.
Navigable depth of canal (all structures built for 30 ft. depth)	25 ft.
Weight of each leaf of lower gates	425 tons
Total estimated weight of metal in lock gates and their machinery	12,300 tons
Total estimated weight of metal in valves of locks and weirs and their machinery	3,200 tons
Estimated connected motor load for operating and lighting canal and Port Colborne elevator	11,200 h.p.
Time required to fill a lock	8 minutes
Estimated time for vessel to pass through canal	8 hours
Total rise	326½ feet
Length	25 miles
Number of railway and highway bridges across canal	22

Quantities

Earth excavation	Cu. yds.	40,200,000
Rock excavation	Cu. yds.	6,740,000
Watertight embankments	Cu. yds.	2,700,000
Concrete (all kinds)	Cu. yds.	2,850,000
Steel reinforcing	Lbs.	18,500,000

The estimated cost of the canal at 1912 prices was $50,000,000. For the purpose of construction the work was divided into nine sections and contracts were awarded for the construction of Sections 1, 2, 3 and 5 in 1913. The first three sections include the Lake Ontario entrance (Port Weller Harbour), the seven lift locks, eight bridges and the canal prism between the lake and Thorold.

Owing to the European war, the work on the canal practically ceased in 1916. In March, 1917, it was entirely closed down and the contracts cancelled in 1918. After the armistice of November, 1918, the Government decided to resume work on a small scale on Sections 1, 2, 3 and 5. During 1919 and 1920 it was continued in a more or less intermittent manner due to want of materials, labour troubles and other causes.

During 1921 the work of completing Sections 1 and 2 combined and Section No. 5, with a small portion of Section 4 added, were re-let on a unit price basis. The contract for the former was awarded to J. P. Porter and for the latter to the Canadian Dredging Company and in June, 1922, Section No. 3 and No. 4 were re-let on the same basis to P. Lyall Construction Company.

The expenditure on the Ship Canal to the 31st March, 1922, including surveys, engineering expenses and right-of-way, amounted to $30,588,026.07, less value of plant sold and to be sold $4,254,300.24 leaving a net expenditure of $26,333,725.83 which includes some other redeemable assets.

FAIR VOLUME OF BUSINESS

HALIFAX, N. S.—We completed and delivered the last ship we have built, the "Canadian Constructor" to the Department of Marine, on January 7th last, and this year we have built no new tonnage of any description, our work being confined solely to dry docking and hull and machinery repairs, of which we have had a fair volume, considering the depressed condition of shipping the world over.

During this year, our dry dock at Halifax and marine slips at Dartmouth, have been continuously engaged, but the volume of repair work has been much below that of former years, consequently we have been working with a very much reduced staff. Last year we were employing 1,400 to 1,500 men at Halifax, while this year our force has been running from 150 to 250 men

CANAL TRAFFIC INCREASES

LARGE increases in canal traffic over last year are shown in the record for September, 1922, an important month, due to the marketing of Western products. The following canal statistics are illuminating:

Sault Ste. Marie Canal.—Total traffic through the Canadian and American locks at Sault Ste. Marie showed an increase of 4,503,984 tons, or 70 per cent. over September, 1921. The big increases were in iron ore and bituminous coal which increased 3,047,694 tons and 1,360,892 tons respectively. A total of 2,354,743 tons of bituminous coal passed up the canal during the month. Wheat increased 9,376,874 bushels and other grains increased 1,472,527 bushels.

Welland Canal.—Total traffic increased 84,167 tons, or 19 per cent., grain, steel and general merchandise accounting for the greater portion of the increase. Corn showed a falling off, but increases in oats, rye and wheat more than offset it. Pulpwood and soft coal showed decreases of 7,964 tons and 53,822 tons respectively. Soft coal upbound totalled 3,729 tons as against 9,703 tons during August, but downbound shipments increased to 39,549 tons from 7,100 tons the previous month.

St. Lawrence Canals.—Total freight traffic increased 125,587 tons or 24 per cent., but the passenger traffic showed a slight decline, being 8,412 against 8,571 for September, 1921. Corn shipments declined 51,317 tons but rye increased 43,141 tons and wheat increased 116,053 tons or 3,868,400 bushels. The total shipments of wheat since the opening of navigation were 39,463,800 bushels, an increase of 17,029,200 bushels over the same period last year. Iron and steel showed an increase of 7,652 tons over September, 1921, and for the season showed an increase of 47,986 tons over last year. Pulpwood also showed an increase of 53,294 tons for the season, although September shipments showed a slight decline. Coal shipments had not reached last year's record although they showed considerable increase over August 1922.

MAURETANIA'S RECORD

NO STEAMSHIP ever launched can claim so magnificent a record of service as the British liner "Mauretania." As a passenger ship she has steamed 850,000 miles and carried nearly 400,000 passengers. Including her voyages during the war, she has travelled over one million miles. Moreover, she holds all the speed records and has further achieved the remarkable feat of maintaining an average of 25½ knots on twenty-seven consecutive runs across the Atlantic. Even more striking is the fact that on three recent successive voyages the times taken for the Atlantic crossing differed by less than five minutes.

In stressing the need for immigration Lord Shaughnessy in a recent speech, stated: "We have been hiding our light under a bushel, with the result that we have lost to other countries thousands of excellent settlers, who should have come to us. Indeed, it is worse than that, because the census returns show that in 1922 Canada has a population of 7,200,000, and the census returns for 1921 show a total population of 8,700,000. But in that period the vital statistics show that there was a natural increase of 1,836,000, and immigration into Canada from other countries of 1,975,000. Had we received no immigrants at all, the natural increase should have given a population of 9,000,000."

Some Factors in Power Transmission

Care Required When Installing Shafting—Figuring the Size of Shaft—Joints Should be Properly Made to Ensure Efficiency—Reducing Friction by Means of Ball Bearings

OPINIONS of engineers differ as to the best method of power transmission when a number of machines are to be operated in the one plant or department. Some advocate the individual, while others stick to the older method of grouping the machines and operating from one main shaft. Experience has shown that no fixed rule could be made as to the best method to adopt, and each individual case must be solved on its own merits, the solution being based on existing conditions.

Installing Line Shaft Supports

The fundamental consideration in the problem of power transmission is the erection of the line shafting that is to carry the numerous pulleys for driving the various machines. Where individual drives are used long lengths of overhead shafting are seldom necessary, but it is only in comparatively few plants that one will not see a line shaft of some description. It must be obvious that in order to obtain an installation of high efficiency great care must be given to the erection of the various brackets or hangers used for supporting the shaft. The practice followed when erecting a line shaft cannot be clearly defined, as the methods adopted by individual millwrights and mechanics will vary according to their own personal ideas and experience, as well as the local conditions governing each specific case. However, a brief outline may assist those who may have such a duty to perform. Each individual instance must be solved on its own merits, but the summary here given will be the practice recommended when erecting a line carried on ball bearings.

Placing the Hangers in Position

When the approximate location of the shaft has been determined, the hangers or brackets are arranged and secured in their respective positions and aligned by means of a spirit level and a taut string. During the process of securing the bracket or hanger to the wall or ceiling supports, a steel square is used to assure proper alignment of the machined surfaces that carry the boxes or ball bearing housings. It is advisable also to check the erection both horizontally and vertically by means of plumb lines. In the case of S.K.F. bearings the housings are thoroughly cleaned, the felt washers saturated with grease, and placed in the grooves in the housing. The lower sections of the housings are placed in their respective positions and the bearing seatings painted with cylinder oil to prevent the outer ring of the bearing from becoming firmly attached to the housing through the action of rust. Before placing the ball bearing on the shaft the latter should be wiped thoroughly to remove all grit and dirt.

Placing and Aligning the Shaft

The shaft is then raised and placed in the lower sections of the plummer blocks, after which a spirit level is used to make final horizontal alignment of the shaft. The bearings are then fixed in their respective positions in the housings, by means of the locking nut. In the case of free bearings, care should be taken to make sure that the ball bearing fits into its seating in such a manner that the bearing as well as the shaft can move sideways with perfect freedom. When fixed in the desired position the sleeve nuts are firmly locked by the safety grub-screws. Before fitting on the upper sections of the plummer blocks the bearings are well lubricated. When bearings are supported in hangers, care should be taken to avoid excessive tightening of the top locking screw. Final alignment in a vertical plane is then made by means of a plumb line. Examination should not show the shaft rubbing at any point on the bearing housing.

Figuring the Size of the Shaft

When making calculations for size of shafting, it is well to use shafts of ample dimensions to take care of unexpected overloads and subsequent additions to plant equipment to be driven by that particular shaft. For the usual run of line shaft service, where supports are provided every eight feet or less, and where average loads and speeds are used, the shaft rating as given below may be considered good practice:

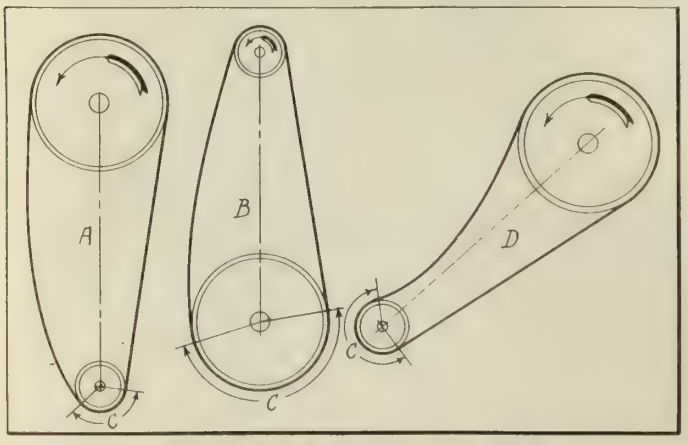


Fig. 1—Points to watch in vertical drives.

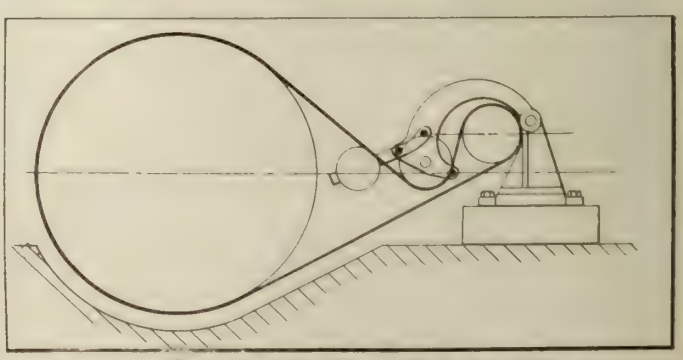

Fig. 2—General outline of Tenix short drive.

H. P. Transmitted by Steel Line Shafting

Dia. of Shaft	Number of Revolutions per Minute					
	100	150	200	250	300	350
1 1-16	6	8.9	11.9	14.9	17.9	20.9
1 15-16	8.9	13.3	17.7	22.2	26.6	31
2 3-16	12.6	19	25	31	38	44
2 7-16	17	26	34	43	52	60
2 11-16	23	34	46	58	69	81
2 15-16	30	45	60	75	90	105
3 3-16	38	57	76	95	114	133
3 7-16	47	71	95	119	143	167
3 11-16	58	88	117	146	176	205
3 15-16	71	107	142	178	213	249

A formula for above table would be:

$$H.P. = \frac{D^3 \times R}{83.7}$$

Shafts Subjected to Heavy Loads

When severe service is required, such as shafts carrying gear drives, large pulleys with wide belts, and where heavy loads and shocks are delivered at intervals or suddenly, a greater factor of safety should be taken. This is necessary to take care of the variations in the stresses on the shaft. A reasonably safe formula in such cases would be the following:

$$H.P. = \frac{D^3 \times R}{125}$$

where D = dia. of shaft in inches.
R = rev. per min.
H.P. = horsepower.

It will be understood that the table and formula given are only approximations. More accurate results may be obtained from the charts shown in Figs. 5 and 6. To use the chart it is necessary to calculate the twisting and bending moments of the shaft, based on the load, distance between supports and other factors. The figures between the heavy black lines indicate the h. p. at the point of intersection of the bending and torsional moments. The charts are based on the formula:

$$D = \frac{\sqrt[3]{5.1 \times (M + \sqrt{M^2 + T^2})}}{S}$$

when:
d = Shaft diameter in inches.
M = Bending moment in inch-pounds.
T = Twisting moment in inch-pounds.
S = Fibre stress in pounds per sq. in.

Stress and Tension in Belts

When a belt is stretched over a pair of pulleys, is cut to the proper length and laced together to form an endless band, it is obvious that uniform tension will exist throughout all portions of the belt, as long as the same is at rest, due to the tightening exerted by the lacing. If the distance between the respective shafts is considerable, the weight of the belt itself will increase the tension in that section of the belt near the pulleys. This increase of tension due to the weight of the belt would make but little difference in the unit-stress of the material, so it is safe to assume that the tension is equal at all points when not exerting a pull.

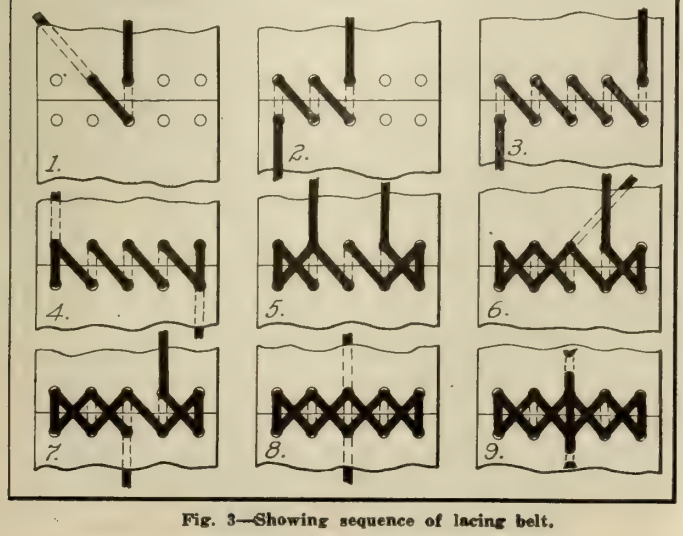

Fig. 3—Showing sequence of lacing belt.

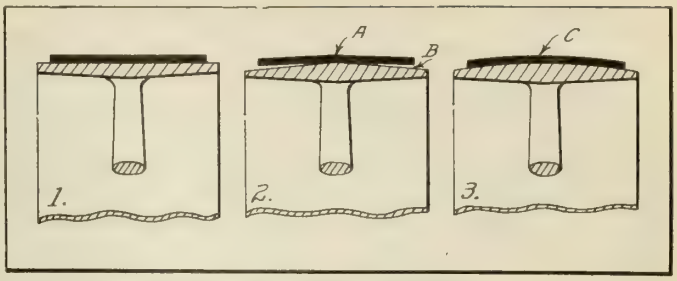

Fig. 4—Flat and crowned pulleys.

In the process of transmitting power, however, the condition of stress in the belt is materially changed. Owing to the flexibility of the belt it is only by pulling that power can be transmitted to the other shaft, so that increased tension is evident in the power side of the belt, the opposite side developing a sag or slackness caused by the stretch due to load resistance. The sum total of the tight and slack side tensions is approximately the same as the uniform stress when belt is at rest. The amount of pull that can be applied to a belt is limited by the tension at which the belt slips around the pulley. Since the force of friction between belt and pulley is dependent upon the normal force with which the belt is pressed against the pulley, and the coefficient of friction between the two, it is obvious that the tighter the belt is laced, and the rougher the contact surfaces, the greater is the power that can be delivered by the belt. From this it would appear that it is possible to transmit any amount of power through any size belt, if such belt were only laced tight enough.

While theory might lead us to this conclusion, the same would be impossible in practice, as no belt would stand the strain. Other practical conditions are likewise involved which fix the limit of power transmitted at a point far below the breaking strength of the material.

Effect of Centrifugal Action

When the belt, as it passes around the pulley, changes its straight-line direction to circular motion, each particle of the belt — like a body whirling at the end of a cord about a centre of rotation — tends by centrifugal force to fly away from the surface of the pulley, thereby decreasing the normal pressure, and hence the friction. This centrifugal action also changes the tension in the belt between the pulleys. As the centrifugal force increases in proportion to the square of the linear velocity, it is evident that the effect is greater at high speeds than at moderate or low speeds.

A further circumstance that affects the driving power of a belt is the stiffness of the leather or other material of which the belt is made. When passing around a pulley, the belt is bent to conform to the circumference, and is again straightened out as it leaves the pulley. It is evident then that the theoretically perfect action is modified somewhat according to the nature of the bending and the thickness or flexibility of the belt, so that a small pulley carrying a thick belt would be the worst case for successful theoretical calculations.

Joints Should be Properly Made

A very important factor in power transmission by belt is that of the laced joints. This, naturally, is the weakest portion of a belt and therefore special care should be exercised in seeing that the connection is properly made. The first thing to consider is the cutting of the belt ends. This must be carefully done. The ends should be cut perfectly square with the run of the belt and the holes in each end properly aligned with each other. An effective method of lacing is shown in Fig. 3. In all cases it is advisable to have the laces on the pulley side of belt running parallel, the crossing being made on the back. Knots should not be used. The best practice is to lock the lace by passing it through an extra hole and pulling it tight. A cut is then made in the lace just

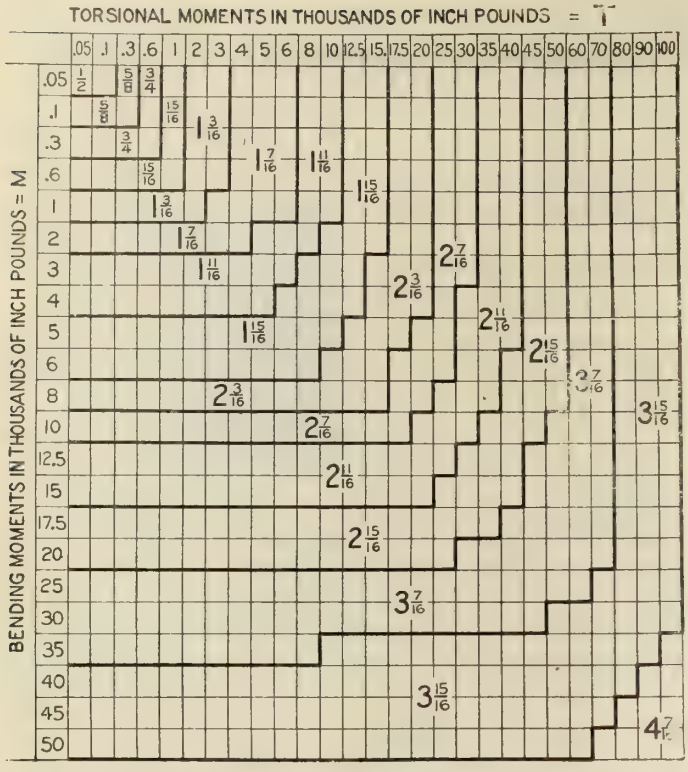

Fig. 5—Chart for finding the h. p. of shafts of small diameter.

clear of the hole, and about half way through, at an angle to prevent lacing pulling back. The lace is then cut off about ¼ in. back of lock.

Crowning the Pulley Face

The crowning of pulleys is a very important feature. A flat faced pulley would give the highest frictional value, but unless conditions are ideal, it is difficult to keep the belt on the pulley. It is general practice to crown pulleys on which the belts are permanently running. There are two methods in use, the flat conical crown and the spherical crown. In the former the apex of the crown is a pronounced point as shown in Fig. 4, and the tendency is to make a poor contact with face of pulley. The method shown at Fig. 3, where the face is rounding, is the better way as it permits a more uniform bending of belt fibres.

Different Systems of Rope Drive

Properly designed rope drives are highly economical and efficient in many situations, for transmitting power between long centres, at angles, around obstructions and particularly where larger units of power are to be carried. The flexibility of manila rope, its positive operation, relatively low cost and long life give it many advantages.

There are two systems of rope transmission. What is known as the English system is made up of individual ropes, separately spliced and running constantly in the same groove of the driving sheave and of the driven sheave. Due to more or less unequal stretch, it is almost impossible even to approximate uniform tension on all the ropes. Consequently it is usual to employ ropes of larger diameter and load them heavily. English system drives are practicable only when the ropes run horizontally or nearly so and in some such situations they are very satisfactory.

The fundamental principle of the so called American system of manila rope transmission is that one continuous rope is used (with only one splice), which travels consecutively through all the grooves of the sheaves and which runs continuously around a winder and tension carriage arrangement, that keeps the rope adjusted at a uniform tension throughout its entire length at all times, for ordinary variations in load. The American system is far better adapted and more efficient for most service.

Efficiency of Rope Drive

The successful operation of any rope drive is dependent primarily upon the design and the proper adaption of those principles which have been demonstrated by experience to govern efficient rope drive practice. The diameters of the sheaves in relation to the diameter of the rope and the speed are important. The location of the tension outfit and how the rope leads to and from it also are vital factors.

The diameter of rope to select, the number of wraps, the form of the sheave grooves, the general arrangement and location of the sheaves, the "wind" of the rope and other questions are individual problems with each drive. They can be answered only from an extensive experience with rope drives for all kinds of service.

To plan a rope drive, complete and definite information is required about the conditions of service. This data should be accompanied by a rough sketch showing the layout of buildings and equipment. The information required to enable engineers to prepare plans and estimates for rope drives is specified below:

The approximate amount of horsepower to be transmitted.

The type of unit that supplies power to the driving shaft and the class of equipment that power is to be delivered to.

Direction of rotation and speed of the driving shaft; also that of the driven shaft.

The diameters of both shafts.

The location of both shafts and their position in relation to adjacent floors, ceilings, walls, posts and other obstructions. This is necessary to properly determine the sizes of sheaves and the location of tension equipment.

How close bearings can be placed on each side of both driving and driven sheaves.

The centre distance of the shafts and whether they are parallel and on what level.

It should also be stated whether the ropes have to clear any obstruction.

Considering the Friction Loss

Present-day factory operation demands that every possible source of leakage be eliminated, or at least minimized. A frequent, and very often inestimable, cause of leakage is the power loss caused by inefficient or faulty transmission installations. Owing to the variable stresses that hangers, shafting and bearings are constantly subjected to, it is imperative that great care be exercised when erecting all classes of shafting that is to transmit power. Friction in bearings is one of the chief sources of lost power. With modern ring-oiled bearings the frictional loss may be reduced considerably, but even with this type of bearing the best results are only obtained after the bearing has been well "worn in," and in attaining this objective, constant care and attention is requir-

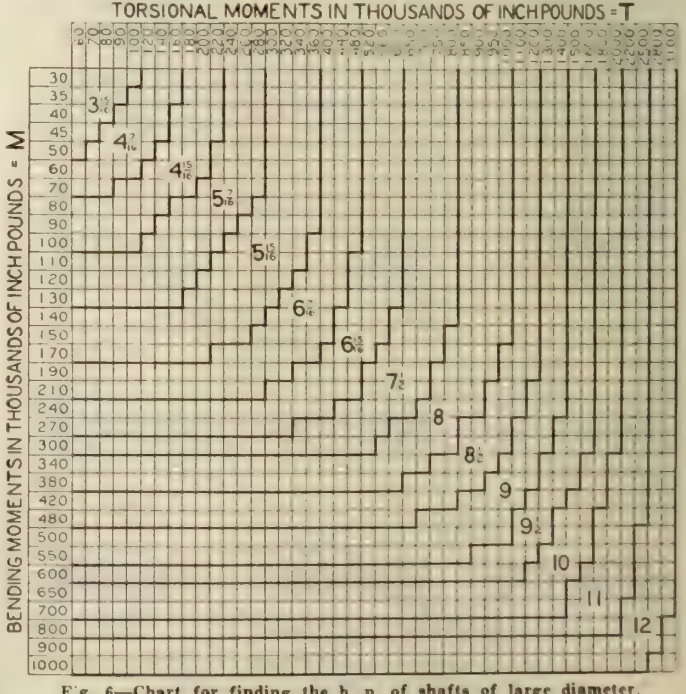

Fig. 6—Chart for finding the h. p. of shafts of large diameter.

ed to see that the oil supply is adequate and shafting kept in perfect alignment.

Allowance for Shaft Deflection

By equipping line and counter-shafts with ball bearings, the cost of lubrication and attention is reduced to a minimum; there is no necessity for "wearing in," and the starting effort is almost negligible. It is essential, however, to avoid bearings of a rigid construction, and provision should be made to counteract shaft deflection, a condition that is invariably present in some form or other when long lengths of shafting are subjected to a number of varying and opposing stresses. Some bearings are designed with swivel housings, but considerable unnecessary strain is often placed on the balls when the bearing is under heavy load. In self-aligning bearings any deflection of the shaft is taken care of by the special arrangement of the housing that permits the balls to roll sideways in the spherical ball race. This instantaneous response to shaft deflection minimizes loss through friction.

The problem of friction loss in transmission equipment must be faced by the engineer sooner or later. It is generally conceded that well designed ball bearings have a lower co-efficient of friction than the plain bronze or babbitted bearing. Few of the plain bearings will register an efficiency greater than 80 per cent. and when poorly installed may show a loss through friction of 30 per cent. or even greater. By the installation of ball bearings this loss has been reduced by upwards of 70 per cent.

Typical Example of Power Saved

As a typical example of the saving possible through the use of ball bearings we will assume that 40 ft. of 3 in. shafting is carried on five plain bearings, the power delivered being 60 h.p. at 250 r.p.m., the total load on the five bearings, including pulleys, belt pull, etc., being about 18,000 lbs. Placing the co-efficient of friction for a plain journal bearing at 0.04, the friction load will be:

$$18{,}000 \times .04 = 720 \text{ lbs.}$$

This gives the ft. lbs. per minute, as:

$$\frac{720 \times 3.1416 \times 3 \times 250}{12}$$

and the h. p. absorbed by friction in the plain bearing of:

$$\frac{720 \times 3.1416 \times 3 \times 250}{12 \times 33{,}000} = 4.28 \text{ h. p.}$$

For well designed ball bearings the co-efficient of friction will seldom exceed .002, so that the loss in such cases would figure out at:

$$\frac{36 \times 3.1416 \times 3 \times 250}{12 \times 33{,}000} = .214 \text{ h. p.}$$

This indicates an approximate saving in power of:

$$4.28 - .214 = 4.06 \text{ h. p.}$$

Aside from the actual power saved, a feature of economic advantage is the low starting effort required for shafts equipped with ball bearings, as the initial pull is relatively the same as when running.

In making calculations for and the selection of suitable bearings, it should be borne in mind that tables generally give the sizes for steady loads and speeds, so that where bearings are subjected to shocks, ample margin should be allowed in excess of the load stated. For this reason it is recommended that a reasonable factor of safety be used when figuring.

Rules to Follow When Installing

When fitting a line shaft with ball bearings it is advisable to adhere to certain conditions. These might be stated briefly as follows: One bearing only should be fixed axially on each independent line of shafting; it is advisable to locate this fixed bearing as near the centre of shaft length as possible; bearings on either side of fixed unit must be located centrally in the housing and be free to move laterally in either direction; where sleeve nuts are used for tightening or adjusting, they should be screwed on in the direction opposite to shaft rotation; be sure and tighten grub screw that locks the sleeve nut; see that ball race is well lubricated with the necessary grease.

The Lenix Short Drive

Lack of sufficient space frequently restricts the length of drive that can be used. In such instances it is generally the practice to fit up an idler to make up for the loss of centre distance. This is especially true when there is a great difference between the diameter of driver and driven pulleys. Fig. 2 illustrates the application of the Lenix flexible idler as used on equipment such as ice machines, air compressors, etc., where the shaft centres are necessarily close together. It is important, however, in obtaining effective service from a drive of this character that a belt be selected with a high degree of pliability and one that will not break down readily under the constant changing positions of belt fibre.

Tension and Power Transmitted

When a belt is working at its full efficiency the pull on the tight side will range from 60 lbs. to 120 lbs. per inch of

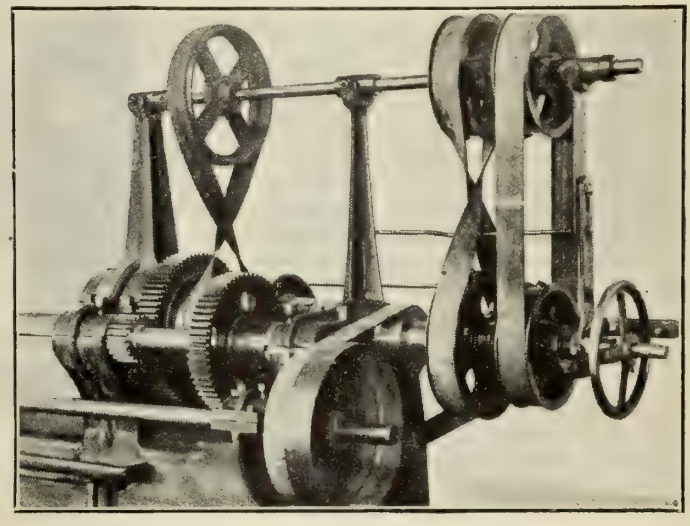

Fig. 7—Interesting arrangement of belt drive.

width for single belts, this stress varying according to the thickness of the leather from which the belt is made. A fair working average is about 90 lbs. per inch of width. For double belts this is increased to approximately 150 lbs., the average between the range of 135 lbs. for light and 160 lbs. for heavy leather. In order that the belt shall do its maximum work the strain in lbs. on the slack side of the belt must bear a certain ratio to the pull tension that slippage does not take place. In practice this ratio will be about 1 to 3, dependent on the condition of the belt and pulley surfaces, and on the percentage of belt contact. Safe practice places the ratio at 1 to 2, so that a fair average for stress would be 45 lbs. for single and 75 lbs. for double belts.

The following rule will be suitable for determining the power capacity of any given belt: multiply the belt width in inches by 45 for single and 75 by double belts, and by the speed in feet per minute, dividing the product by 33,000. The result will give the h. p. delivered by the belt. Suppose a 4 in. single belt is running at 1,200 ft. per min., the result will be found by the rule given, using it in the form of a formula:

$$H = \frac{w \times t \times v}{33{,}000} \text{ where}$$

H=horsepower; w=belt width; t=tension; v=velocity.

$$H = \frac{4 \times 45 \times 1{,}200}{33{,}000} = 6\tfrac{1}{2} \text{ h.p.}$$

For a 10 in. double belt running at 1,500 ft. uer min., the h. p. transmitted would be:

$$\frac{10 \times 75 \times 1{,}500}{33{,}000} = 34 \text{ h.p.}$$

(Continued on page 132)

Greater Production the Aim of Tool Builders

Pleasing Appearance Second Only to Productive Quality—Special Attachments Facilitate Continuous Operation—Ever Widening Field of Grinding Machine — Use of Ball Bearings

By F. F. BARBER,
President of the F. F. Barber Machinery Co.

TRACING the trend of machine tool design and development is both interesting and instructive. From rough, semi-finished, and in some cases uncouth designs, we have come to the stage where general appearance is considered almost as much as the design of the parts themselves. It is quite common nowadays to hear someone remark: "Isn't that machine tool a beauty—look at its lines, and splendid finish."

Thus we have reached the point where machine tool builders appeal to the eye as well as keeping in mind the actual productive value of the tool. This is as it should be, for while the productive capability of a machine is of first importance, still there is no reason why the design outwardly should not be as pleasing as possible.

Take Fig. 1, for example, and compare this miller with the up-to-date style in use today. So far as productive capacity is concerned, there is no comparison, because the latest developments in milling practice have placed the earlier types of milling machines upon the scrap heap. Rather than dwell on what used to be, let us consider a few examples of modern milling practice, which will be more to the point, and of more value to the reader.

Fig. 2 shows a very interesting example of good milling practice. The work being machined is connecting rods, and, as readers know, this is one of the big problems in any motor shop. The milling of the sides of both crank and wrist pin ends usually causes considerable trouble because not only must the sides be parallel and in line with each other, but care must be taken that the rod is not sprung while being held and machined. The set up shown in the photograph gives splendid results.

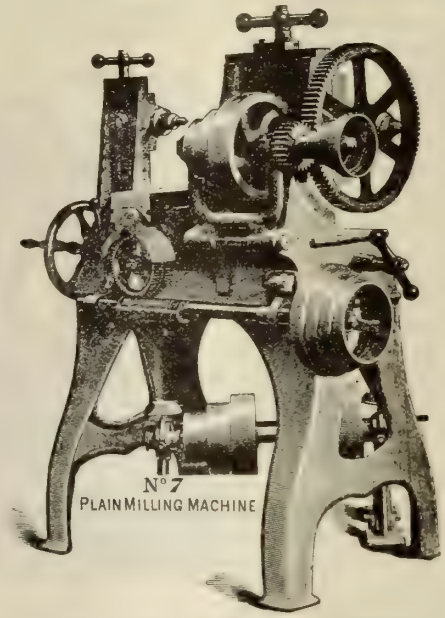

Fig. 1—One of the first types of milling machines.

Two holding fixtures are used, one on each end of the table. Each fixture holds two rods, with alternate ends toward the cutters. As the rod shown is made with both heads of different thickness, the cutters are arranged so that one side straddles the small end, while the large end is milled between the larger cutters nearest the face of the milling machine column.

When two heads on one fixture have been milled, the table traverse is reversed and the two heads held in the other fixture brought into cut. The holding fixture is then swiveled 180 degrees, bringing the other two heads toward the cutters.

To show the remarkable difference in production time over the former method employed, here is the comparison. Instead of twelve per hour, the firm using the method shown now get sixty per hour, and a higher quality of workmanship. Previously the rods were held in an indexing fixture and milled one end at a time. Another point in favor of the modern type of miller is its adaptability. When necessary, special attachments can be quickly placed on the standard machine and with very little

Figs. 2, 3 and 4 illustrate Milwaukee Milling Machines; Fig. 5, Warner & Swasey turret lathe; Figs. 6, 7, 8 & 9, Gould and Eberhardt equipment; Fig. 10 is a Lucas boring machine; Fig. 11, a Landis grinder; Fig. 12, a Bullard vertical boring lathe.

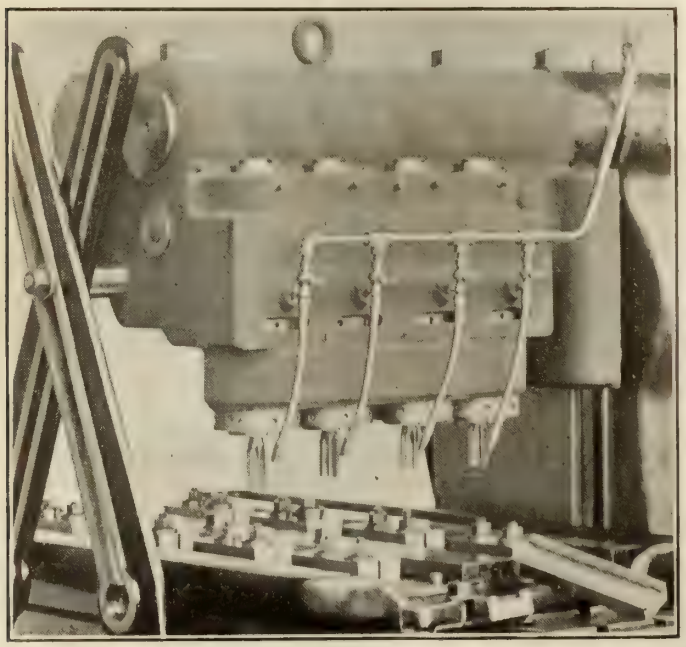

Fig. 3—Special 4-spindle vertical attachment milling channels in patented tool holder.

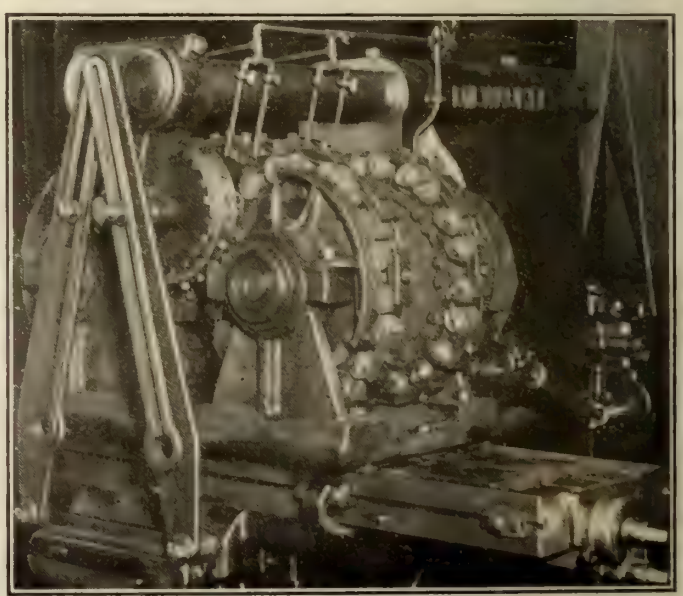

Fig. 4—Plain milling machine milling both ends of rifle grenades.

trouble. Fig. 3 is a good example of this.

Here we see a special four-spindle vertical attachment together with work holding fixture, placed on a standard horizontal milling machine. This device was used to mill channels in patented tool holders, and while special in character, proved a decided success. The head containing the four vertical spindles is carried on the overarms, and is clamped to the face of the column, thus forming a rigid attachment. Each spindle can be adjusted for height separately, so that no confusion can arise from this point. A sample of the work is shown in foreground of photograph.

Other Production Stories

As this article will try to cover in a brief manner other classes of machine tools, we will only give a few production stories on each type of machine, trying to tell these in words instead of pictures wherever possible. This will conserve both time and space.

The milling of a worm on a milling machine a decade ago would have been considered a ticklish proposition. Today it is a commonplace occurrence, and with the help of a worm-cutting attachment splendid production times can be obtained. For example: Recently a worm 5¾ in. in dia. with a cut of 2½ in. wide and ¾ in. deep was completed in 25 minutes, which is mighty good time, even on a modern miller. This was done for a large oil refinery company in the Phillipine Islands, and proved very satisfactory.

Railroad shops here found great use for milling machines. In machining locomotive connecting rod brasses on a rotary table, on a standard horizontal miller, it was found that with one set up the part could be finished complete in one hour and five minutes, against four hours, the former time. Originally the job was finished on a shaper, proving the selection of the machine used is very important. It is often good practice to switch from one type of machine to another, even if you have followed some certain routine for years.

There is also the question of studying the proper type of cutter to use. Here is a case in point. In milling gear shifter fingers for a firm in the United States, steep spiral, coarse tooth cutters were used to remove machine steel ¼ in. deep, 2 in. across and 8 in. long. By using this style of cutter, the work was completed in one minute, floor to floor time. Where a heavy reduction of metal is required it is good practice to use cutters of the type mentioned. Examples of work performed could be quoted almost indefinitely, but we pass on to another machine after two further examples.

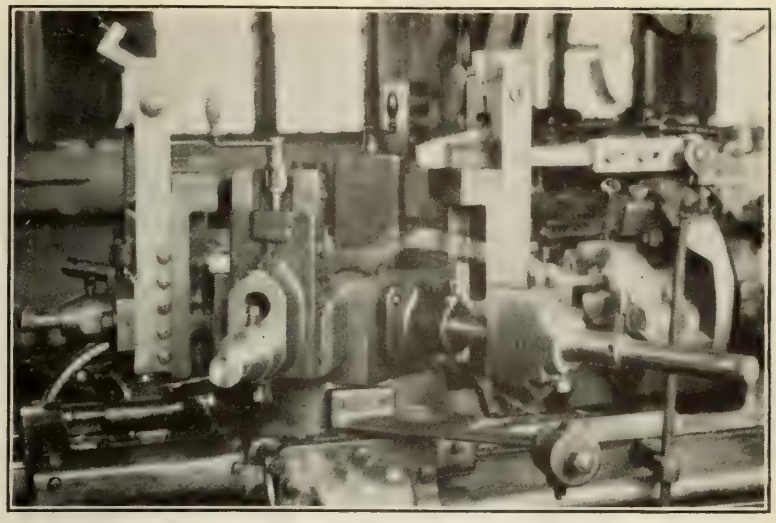

Fig. 5—Finishing bore of glass insulator mould on hollow hexagon turret lathe.

Fig. 4 shows an extremely interesting operation. This was the milling of both ends of rifle grenades. It will be noted that two special rotating drum fixtures are mounted on the table, each holding two rows of parts, so arranged that four grenades are in the cutters at all times. The drums are rotated by means of a universal shaft from the feed box to a worm shaft which drives one drum, the other being geared up with the first, so that both drums revolve toward each other.

Four inserted high-speed cutters are used, and two operators, one at each drum, load and unload. A production average of 800 per hour was obtained over a three-months' period, and to show the comparison over the former method, here is what the fixture saved the firm who adopted it. Thirty-four lathe operators, for previously these parts were competed in the lathe, and the one machine shown took the place of the thirty-four operators spoken of above.

The next example of milling practice will be told in words only. To mill the slots in open wrenches, a vertical milling machine was used. A circular fixture was mounted on the table, holding 28 wrenches. The wrenches were made of drop forgings, extremely tough, yet by linking the machine up in this way a production of two thousand per ten-hour day was obtained.

Lathe Development

The development in lathe design has also been very rapid. This is particularly true in that style of machine known as a turret lathe. Designers have studied the problem from every angle, keeping upmost in their mind the question of production and accuracy. They felt production was absolutely essential, but that accuracy was equally important, especially in the present stage of interchangeability.

Thanks to careful design, plus intelligent tool layout, wonderful production figures have been made possible, and in order to save space, we will only touch upon a few, giving the story in words wherever possible. For brevity's sake we will simply name the piece, the material, dimensions, and time. Following are some interesting figures worthy of study. A two-step gear blank of cast iron, 12 in. outside diam., finished in five minutes.

A cast iron power pulley for tractor, 14 in. diam., 10½ in. face, with limit of accuracy of bore, plus or minus .001 in., was finished in a production time of twenty-five minutes.

A cast iron flywheel 15¼ in. diam., finished in fifteen minutes, the limit of accuracy, plus or minus .010 in. In this case the part was rough turned, faced, bored, finish bored, and reamed, then finish turned and faced.

Another case—A bevel gear of chrome nickel steel, finished size 11.632 in. dia., 2.0448 in. bore. Accuracy of bore, plus or minus .001 in., accuracy elsewhere .010

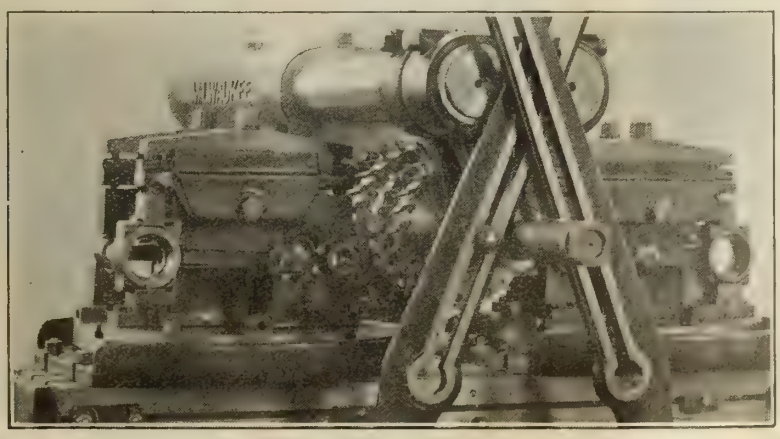

Fig. 2—Machining connecting rods for motors.

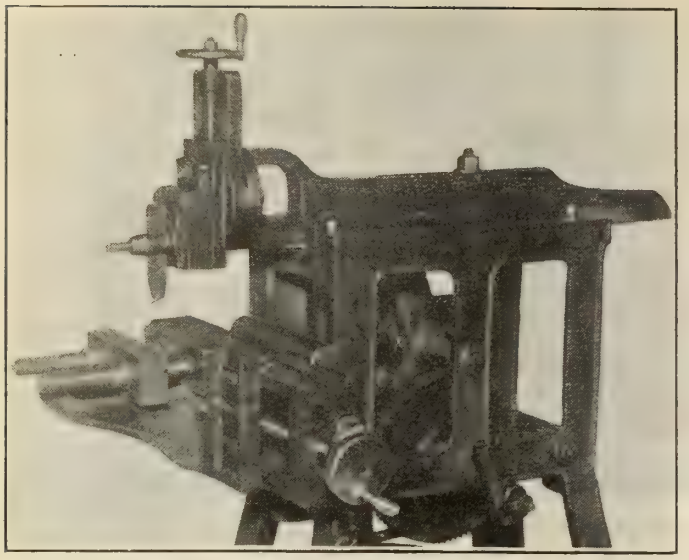

Fig. 6—G. & E. shaper of 1875 period.

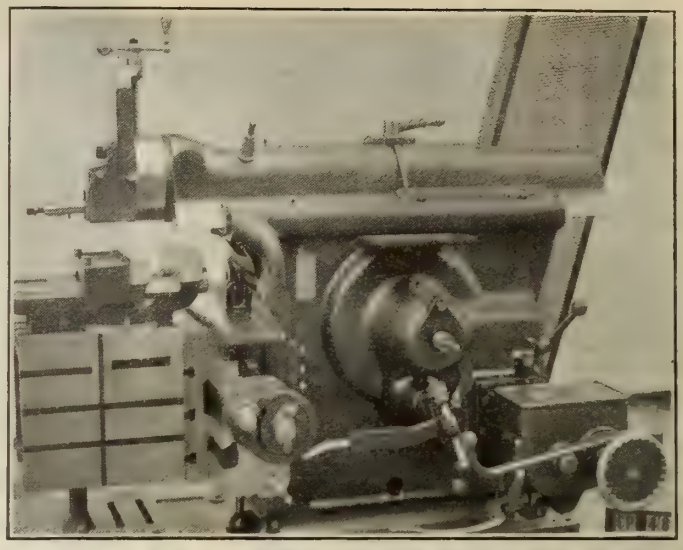

Fig. 7—28 in. invincible type shaper with single pulley drive and gear box.

in., yet the total time was only 1¼ hours.

The next example is better illustrated. Fig. 5 shows a universal hollow hexagon turret lathe equipped with tools for finishing the bore of a glass insulator mold. The time to complete this work, including the two large faces, is only thirty minutes, against a previous time of eight to ten hours. These figures are almost unbelievable, but have been proved by actual test. This shows conclusively how important it is to select the proper machine for the work. It will be noted that special tools were fitted to the turret, to form the bore of the mold. This also proves the value of careful tool layout study.

Before leaving the subject, attention is called to the fact that several factors have been helpful in the development of turret lathe work. First the design, then the following aids:—Careful tool layout, quick action chucks, better steel for the cutting tools, and more intelligent treatment of the tools after their being in use. These, coupled with a better understanding of manufacturing conditions by makers of such machines, and careful and painstaking experimenting on their part, has all helped to make the turret lathe a favorite production tool. In many cases, the adoption of the factors already expressed have resulted in boosting production as high as four times the figure of a few years ago.

Shaper Development

The best way perhaps to show the development in shaper design is to reproduce an old model and a new. Figs. 6 and 7, tell a story in themselves. The machine shown at Fig. 6 was designed in 1875, while the one shown at Fig. 7 is a modern tool, although even further development has taken place since the latter photograph was made. This is one feature of machine tool development that keeps up the interest. There is always something new coming up, and generally it is a still further improvement on a well-known grade of tool. Designers are continually striving for something just a little better than their former efforts

No attempt will be made to show actual shaper operations. Enough to say that to-day we have work completed on shapers that would have been impossible a few years ago. As the design improved, the versatility increased, until at the present time, batteries of these tools are installed in manufacturing plants, all working on a production basis. Rigidity, quick feed changing, rapid and easy moving of the ram for stroke, etc.; these features and many others have helped to make the shaper a productive and accurate tool.

Gear Generators

Then we come to gear generating machines. There has been a wonderful development in this field, and as an example of modern practice, look at Fig. 8, which shows an automatic gear generating machine cutting steel forging herringbone gears used for steam turbine

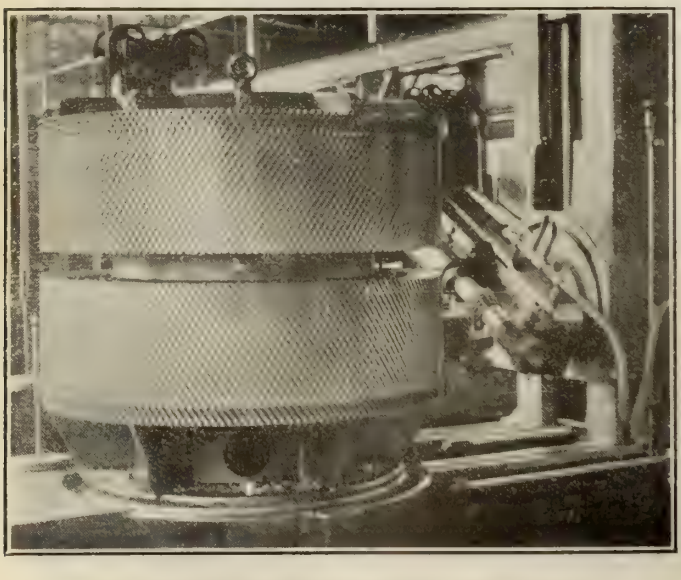

Fig. 8—Cutting herringbone gears for steam turbines.

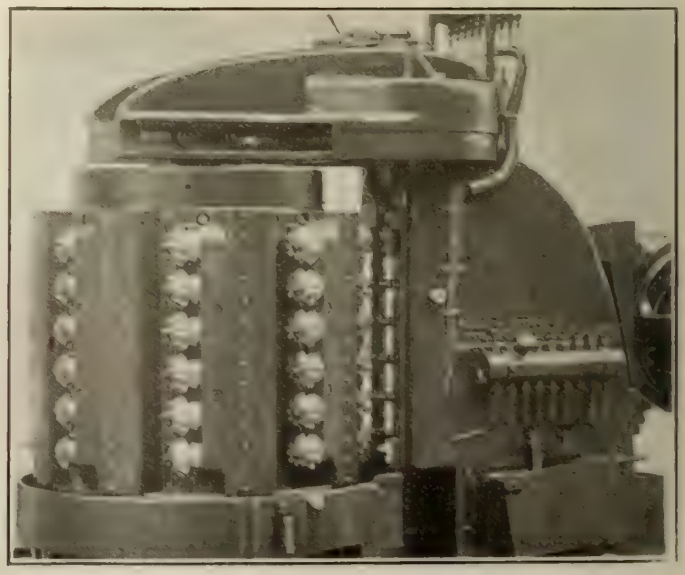

Fig. 9—Continuous milling machine arranged to cut 9T., 3/4 pitch steel pinions.

propulsion units. A decade ago this work would have taken about five times as long to complete, and even then special arrangements would have been necessary before such a job could have been completed. Twenty or thirty years ago it would have been considered impracticable, now it is a matter of course.

To go into gear generators would take an article in itself, so we will pass on to other developments which have occurred. We now have rack cutting machines, vertical automatic gear cutters, cam milling machines, continuous milling machines, both vertical and horizontal, worm wheel generating machines, and many other tools of kindred nature.

Take briefly one production time on a continuous bevel gear milling machine shown at Fig. 9. The pinions being cut are tooth, ¾ pitch, and are made from steel. Six are being cut at one time, forty-eight being held on the turret. The cutters used are 5½ in. diam., running at 90 r. p. m., 130 ft. per minute. The production is sixty-four per hour complete.

Boring Mills

Horizontal and vertical boring mills have also received the close attention of designers. The horizontal mill of today is a highly perfected machine, capable of performing work not even thought of a few years ago. This includes milling of dies, gas engine frames, crank cases, large and small castings of all kinds, frames of pumps, etc., and all classes of general manufacture. Fig. 10 is a good illustration—this being the boring of 8 in. holes in a tractor crankcase. The center distance had to be correct, and the surface milled at the same setting. It will be noted that no jig is used, also that the facing cutter does not need to be removed for the boring operation. What holds true of this particular job is likewise true of other classes of work.

Grinding Machinery

Grinding machinery has also shown great improvement during recent years

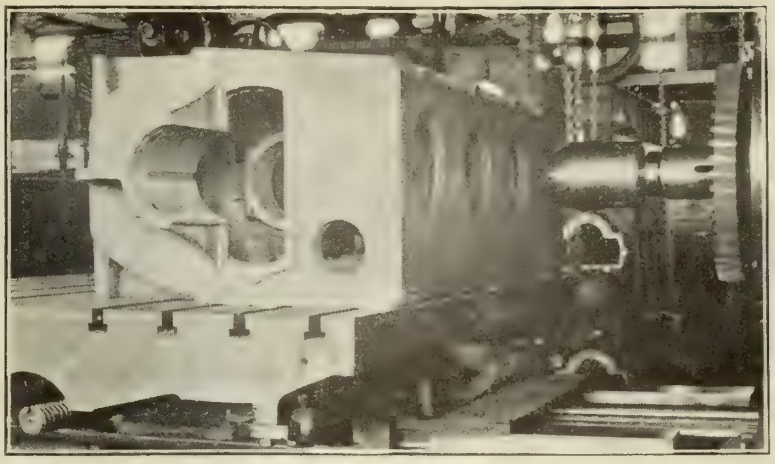

Fig. 10—Boring 8 in. dia. holes in tractor crankcase with boring head.

This applies to all classes of grinding machines, but to save time and space, we will confine ourselves in this case to one type, viz., cylindrical grinding machines.

To show how production conditions have improved, here is an actual comparison. Several years ago, it was considered good business when seven four-throw crankshafts could be ground per day. Now, a "Ford" four throw crankshaft can be ground at the rate of one every four minutes, one minute to each pin. This means easily one hundred finished crankshafts per day.

The same improvement holds true on other classes of cylindrical work. It may not be so pronounced in all cases, but the percentage is very large. This is due to the careful thought of the designers, plus the intelligent selection of the wheel used. The study of grinding wheels is now a well known one, not as well known as it should be, but much improved over a few years ago. This fact, coupled with easily controlled machines makes for added production.

For special purposes, the regular style machine is often modified to meet in with certain conditions. For example, Fig. 11 shows the front view of a self-contained piston grinding machine which not only grinds the piston concentric, but relieves it around the pin hole when it reaches that stage. This is done by means of a cam in the headstock, operated by a convenient lever on top.

Surface Grinding

Surface grinders have also developed rapidly within the past few years. So much so, that many operations previously machined on other tools are completed on the vertical surface grinder. The production time is usually very large, and briefly, here are a few figures of actual experience:

A gear box surface 18¼ in. x 14 in., approximately ⅝ in. wall, material cast iron, ⅛ in. stock removed, ground at the rate of 6 per hour.

Cylinder castings, material cast iron, weight 90 lbs., stock removed from .015 in. to .020 in., with limits of plus or minus .003 in. Two sides ground. The production time 16 parts per hour, or a total of 32 surfaces ground. The cylinders spoken of were rough milled before grinding, this being the usual practice.

Ball races, hardened steel, size 21/32 in. Amount of stock removed, .007

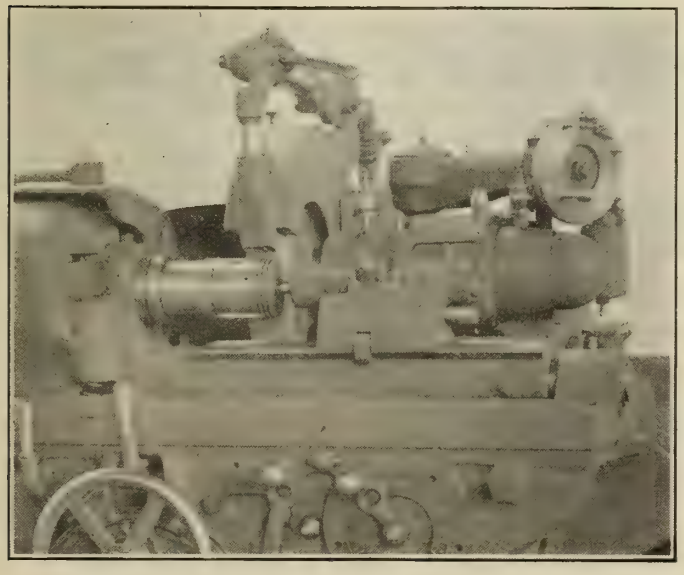

Fig. 11—Front view of grinding and reliving machine.

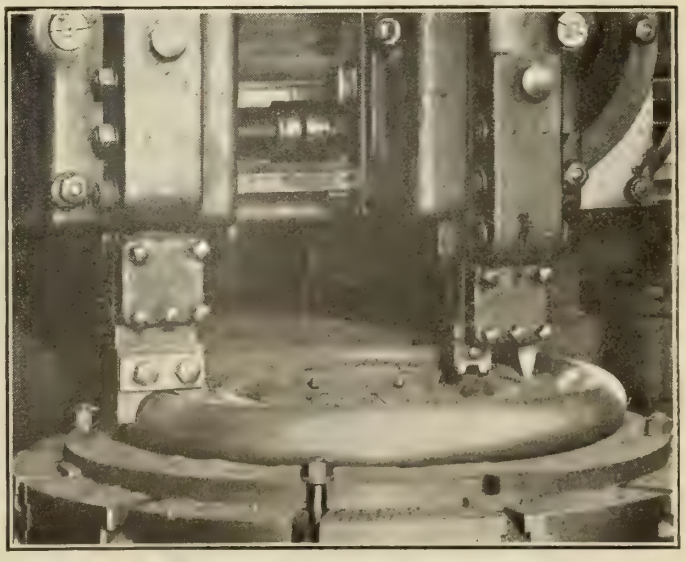

Fig. 12—Machining a mold core for rubber tires.

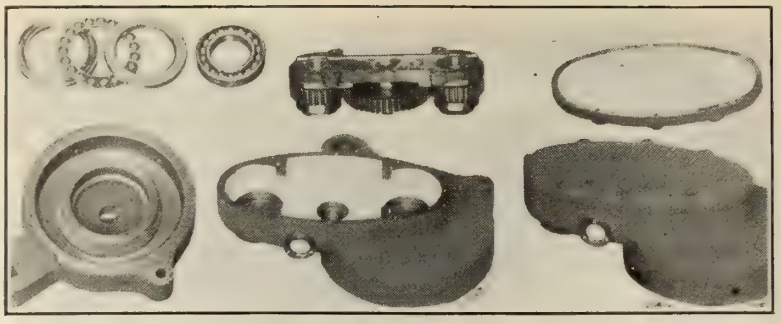

Fig. 13—Showing some applications of ball bearings to machine tool mechanism.

in. per side, two sides being ground. Limits, plus or minus .0005 in. Production 700 pieces per hour, or a total of 1,400 surfaces.

Bevel pinions, stock removed .010 in., ground on one side, material, hardened steel, production rate 400 per hour.

There is no need to quote further. Sufficient has been shown to prove that the surface grinder has reached the point where it is a production tool, not merely a finishing-off machine. The use of magnetic chucks in connection with this tool has helped considerably. No fixtures or set-up is necessary. Simply place the pieces on the chuck, switch on the current, and the parts are securely held. On thin parts, this method is especially valuable, because warping, etc., is avoided. Of course, where the part is heavy, and it is deemed advisable, fixtures can be used to good advantage.

Vertical Boring Mills

The vertical boring mill must not be forgotten. From a crudely constructed tool, it has reached the point where it is one of the important members of the production family. For brevity's sake we will show only one application of vertical boring mill work.

This shows the machining of a mold core, and three operations are performed on this piece. First, rough bore and recess, rough face for setting. Second operation, roughing, rough around the core to center line outside. Second setting, turn core over, rough around core outside to meet previous operation.

Third operation—finish, set in ring fixture shown in photograph, finish form to one side, reverse and finish form to the other. The total time under ideal conditions was one hour, seventeen minutes, but a general production time has been obtained of two hours, forty-seven minutes.

As stated previously, this is only one isolated example, but if this were not merely a sketchy outline of machine tool development, we could fill a volume on work produced sucessfully on this type of tool.

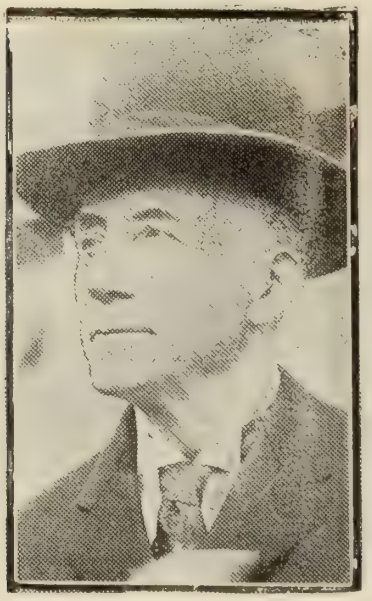
Ball bearings have played a large part in the development of machine tools, and practically every class of tool has found its own particular application. It is impossible in an article of this nature to touch upon the subject in detail so we will simply show how they have been applied to one make of radial drill.

Fig. 13 shows one cap unit at (A) assembled complete. The center view (B) shows the cap dissembled, while (C) shows the cap used on machines with motor on arm drive. Above the cap will be noticed the ball bearings, which fit into the cap and take the weight and radial load of the outer column on the inner column. This machine has several features, but one point is worthy of special attention. It is claimed by the makers that all parts are interchangeable. In other words, the entire machine is built up of separate units, and are interchangeable should the occasion arise when a new unit is required. The tool is also equipped with ball bearings throughout, and has all steel gears running in oil.

These features are mentioned in a brief way, because in concluding this article, it is desired to call attention in a general way to several improvements which have made the development of machine tools as rapid as it has been. Following are a few:

Improvement in general design, steel gears in place of other metals, more efficient lubrication, improved feed changing mechanism, a greater range of feeds and speeds, study of the operator with the resulting placing of operating levers in convenient location, better driving methods, all gear headstocks in some cases, use of ball and roller bearings, friction clutches, collapsible taps and dies, quick action chucks, special fixtures, and other production aids. Last but not least, the designing of the tool to stand overload if placed upon it.

These improvements, and thousands of others, have taken time, but not so much as might be imagined. Our machine tool designers have showed wonderful ingenuity, even to the developing of special machinery for special purposes. A trip through the "Ford" plant, or any other large automobile factory, will convince the most skeptical that machine tool designers deserve a high niche in the hall of fame. As stated at the beginning, this is merely a sketchy outline of a few of the developments which have taken place in the machine tool industry during the past few years.



Prince Edward Island to Pay Its Way

By HON. JOHN H. BELL,
Premier of Prince Edward Island.

DURING the years of depression we are endeavoring to move along quickly. The main distinguishing characteristics of our regime are:—

First.—To improve and place on a satisfactory basis the school system of the Province.

Second.—To build improved roads. Of these some 300 miles have already been constructed.

Third.—To establish and operate an agricultural technical school with a view to make farming more productive and to induce the young men to stay by the farm.

Fourth.—To administer the public affairs on the principle "pay as you go." At the end of each financial year to exhibit a small surplus and make a payment towards the redemption of the public debt.

Notwithstanding the general depression, the industrial conditions are highly satisfactory.

Money Available to Finance Industrial Growth

Current Loans Smaller Than at First of Year—Deposits and Loans Ahead of 1914—Confidence Indicated by Investment in Industrial Securities—Danger of Labor Shortage

By J. W. TYSON,
Editor, The Financial Post.

ALTHOUGH the year has been marked by a gradual but substantial expansion of industrial activity, particularly in the pulp and paper, textile and lumbering trades, the fact that current loans by the Canadian banks, as shown in the latest bank statement, were smaller than at the beginning of the year may be taken as an indication that as yet capital has not been heavily called upon in this direction and that, as consumption warrants, there will be money available to finance that further development in manufacturing and in general business which is looked for in 1923. This may also be judged from the fact that although there has been a decline in savings deposits during the year these are still substantially more than the current loans; while to go back to pre-war conditions we find that it was not by any means an unhealthy situation when current loans were greater than savings. In the following summary will be found comparative figures of savings and current loans for various months during the year together with yearly figures back to 1914.

August	Savings Deposits	Current Loans
1914	$ 659,399,151	$ 836,574,099
1915	692,580,626	758,342,735
1916	806,774,687	739,938,513
1917	952,591,821	836,429,670
1918	1,014,411,865	920,775,269
1919	1,196,632,931	1,011,785,424
1920	1,261,647,732	1,385,470,153
1921	1,279,830,731	1,226,467,704
1922—		
January	1,233,208,401	1,138,151,455
February	1,231,349,001	1,143,538,489
March	1,230,628,840	1,149,187,869
April	1,218,195,262	1,162,975,332
May	1,197,789,747	1,140,425,500
June	1,181,404,188	1,117,844,707
July	1,175,781,711	1,104,122,176
August	1,164,069,400	1,102,466,692
September	1,158,462,380	1,114,678,735
October	1,156,442,453	1,122,840,459

One impressive feature of these figures is that although we have seen considerable deflation both deposits and loans are far ahead of what they were in August 1914. This particularly refers to savings and this despite the fact that there has been a considerable decline during the period of depression as an increasing number of people have found themselves in a position where they have had to draw on their reserves.

Evidences of deflation are to be found in the latest bank statement which shows that the gross bank assets of $2,680,000,000 are $126,000,000 less than a year before. In addition to the reduction of $120,000,000 in current loans, there was a reduction of $16,000,000 in gold reserve, $8,000,000 in municipal loans and $43,000,000 in loans of public securities, while call loans abroad, loans on government securities, and holdings of specie were considerably increased. In addition to a reduction of about $95,000,000 in savings deposits there was a cut of $34,000,000 in demand deposits during the year and of $15,000,000 in circulation, the latter being an indication of the smaller requirements as regards cash for business purposes.

Capital for Development

In addition to funds for current business as provided by the banks, the investment of capital in securities—bonds and stocks—is an important factor in the development of industry. Here again there is not only confidence in the future of the country from the manufacturing standpoint on the part of Canadian investors but also on the part of investors in the United States who have been putting large sums into Canadian enterprises and Canadian branches of American concerns. Canadian capital dominates in industrial investments and particularly in the steel and iron industries but American holdings are much larger than those of British investors who evidently prefer to put their money into government or municipal bonds and utilities and into land or mortgages rather than venture in the industrial field where management and direction is so important and where the Americans, with their knowledge of Canadian conditions, have shown marked superiority. Following is a summary of Canadian industrial securities showing where they are held. The figures are prepared by the Department of Statistics at Ottawa and while they may not cover all forms and classes of industry, they are indicative of the large total of money invested in Canada's manufacturing concerns and also of the sources from which this money has been secured:

ALL CANADIAN INDUSTRIES

	Owned in Canada	Owned in United States	Owned in United Kingdom	Owned in Other Countries	Total
	$	$	$	$	$
Stocks.	1,416,653,060	801,657,448	245,812,994	14,250,878	2,478,374,380
Bonds..	164,835,207	33,006,441	34,821,543	4,179,585	236,842,776
Oth. sec.	9,558,329	13,791,700	4,818,638	105,000	28,303,667
Totals.	1,591,076,596	848,455,589	285,453,175	18,535,463	2,743,520,823
Approx. p.c.	58%	31%	10.3%	.7%	100%

STEEL FURNACES AND ROLLING MILLS

Stocks..	$37,379,288	$47,625,500	$1,076,000	$672,500	$86,753,288
Bonds..	30,220,981	150,000	....	....	30,370,981
Oth. sec.	....	....	....	....	....
Totals .	67,600,269	47,775,500	1,076,000	672,500	117,124,269

FOUNDRY AND MACHINE SHOP PRODUCTS

Stocks..	25,077,052	20,847,905	5,378,129	117,400	51,420,486
Bonds..	1,057,100	500,000	609,298	....	2,166,398
Oth. sec.	24,000	....	....	....	24,000
Totals .	26,158,152	21,347,905	5,987,427	117,400	53,610,884

The faith in Canada's future of investors and financial and industrial interests in the United States is also indicated in the fact that, according to reliable estimates, Canada borrowed in New York $240,000,000 during the first nine months of the year. These borrowings were chiefly new money and of the total $100,000,000 was raised by the Dominion on particularly favorable terms. This flow of new capital into Canada has been the dominating factor in the restoration of the Canadian dollar to par in terms of New York funds. As compared with these borrowings the favorable trade balance was only about $6,000,000 a month during the period referred to, while other factors which helped to strengthen the Canadian dollar were the congestion on Eastern American railroads, which aided the export of Canadian grain and comparatively small imports of coal because of the strike. Such authorities as Sir Frederick Williams-Taylor and Sir John Aird express the opinion that the dollar will return to a discount in the future but this has a favorable rather than unfavorable effect in creating opportunities for the investment influence in regard to the investment of American capital in Canada.

Wages and Prices

Definite indication of the expansion of industry during the year is is to be found in the upswing of industrial employment from 77.9 per cent. in January to 95.8 per cent. in November. Reports from 6,600 firms show 785,451 persons employed, an increase of 6,180 above the last report, thus increasing the index number from 94.6 to 95.8 for October and November and 90.2 for Nov., 1921.

In this situation there is a danger that a labor shortage

(Continued on page 138)

General view on the Canadian prairies during the harvesting season.

Proposals Looking to Improved Immigration

Returns Since 1921 Show Arrivals Falling Off Since Pre-War Days—Twenty-Five Million Acres Suitable for Cultivation Along Railway Lines—Opportunities—Government Plans

THAT ALL interests from whom co-operation would seem desirable are anxious to promote policies looking to immigration and colonization along high standard lines is evident at the present time. The population of Canada, in relation to the resources and opportunities of the country, has not grown as it should. There is enormous railway mileage along which settlement is practically negligible. All plans or suggestions looking to a more progressive policy are entitled to careful consideration. Well directed action is desirable.

Probably the situation cannot be better described than it was in a recent memorandum addressed recently to the Hon. Charles Stewart, acting minister of Immigration and Colonization, by transportation interests. While it may be contended that these interests have selfish reasons, it is undeniable that, to a very large extent, the fundamental object is the upbuilding of the country, and that they are in very close contact with problems confronting the government, and with information calculated to be of immeasurable value in formulating a course of action.

"Aside altogether from the question of transportation of immigrants," states the memorandum, "we have a special interest in the adoption of a broad immigration and colonization policy for Canada which justifies them in directing your attention to certain basic facts as bearing upon this important subject, and in asking that prompt consideration be given to the recommendations which they make hereunder:

General Conditions

"We direct your attention to the very unsatisfactory showing with regard to the population of Canada as indicated by the census of last year.

The census of 1911 showed that Canada then had a population of	7,206,643
The immigration returns of your department from 1911-1921 showed an immigration into Canada of	1,975,393
The vital statistic return (births only) for the same period shows a natural increase of	1,836,407
Net	900,000
The census returns for 1921 show a total population of only	8,769,494

"Our national debt has now reached the enormous sum of $2,387,676,000 as compared with a total national debt in 1914 of $335,996,850. The present national debt, on the basis of the census of last year, indicates a capital charge of $272.27 per head, or an annual charge per capita of $16 to pay the interest thereon.

"The mileage of railways in operation in Canada at the present time is 37,080 miles, which shows that we have one mile of railway in operation in Canada for every 236.5 of our population, and in the four Western provinces one mile of railway for every 110 of our population.

Lands Unoccupied

"Careful investigation has indicated that in the three prairie provinces of Western Canada we have, adjacent to railway lines in operation, at least 25,000,000 acres of land within 15 miles on each side of these railway lines suitable for immediate cultivation, but, at the present time unoccupied, and that in the older and Eastern provinces, many thousands of improved farms are unoccupied and unproductive.

"The immigration returns for the first eight months of the current year ending August 31, show a total immigration into Canada of 45,162 as compared with a total immigration for the same period of 1921 of 70,034. It is further pointed out that the returns for 1921 showed a serious falling off in immigration as compared with pre-war days, and these facts, when taken in conjunction with that mentioned above, relative to the unsatisfactory returns of the 1921 census, indicate that we are losing in emigration from Canada as many people as we are bringing in.

"The transportation interests have made every provision through the medium of additional fast ships and additional railway rolling stock, to handle a large influx of immigrants, much of which additional equipment, both of ships and rolling stock, is lying idle owing to the cessation of any marked movement of immigrants into Canada.

"We would further direct your attention to the fact that new trade routes to and from Canada cannot be established, or ships maintained on some of the existing routes, on the basis of freight traffic only, and we urge that consideration be given to these facts as bearing upon the necessity for stimulation, in every way, of the movement of desirable colonists.

"The facts above stated, and the additional fact that the necessity for a comprehensive and progressive immigration

policy is now being urged through the medium of the newspapers of Canada, resolutions from boards of trade, clubs and other public institutions, including the Trades and Labor Council of Canada, justifies our laying before you, somewhat in detail, our views relative to the general policy which should be promptly adopted to meet this important and pressing situation.

"We are of opinion that a general policy for immediate adoption by the government to meet this serious situation should include the following:

"(a) That a return to the method formerly in effect by which the affairs of the Department of Immigration and Colonization were administered by a separate minister, together with a full and complete staff of qualified officials for his department, would facilitate an active immigration policy.

"(b) The immediate issue by the Department of Immigration and Colonization of a general invitation through the medium of advertising, publicity, lectures and exhibitions, to all desirable immigrants to consider the opportunities offered by Canada for home-making, and that this invitation should be addressed to Great Britain, United States and all European Continental countries from which desirable immigrants can be obtained, it being held that the responsibility for this general invitation to immigrants is the duty and function of the Dominion Government.

"(c) The immediate consideration and acceptance of the offer outlined in the Empire Settlement Act, 1922, for joint action with the British Government for obtaining from Great Britain and Ireland the greatest possible number of desirable colonists on the basis of joint financial expenditure.

"(d) The most careful consideration of the policies now being considered by certain Continental countries for financial aid towards the emigration of their nationals due to congested conditions of population resulting from the war and present industrial and financial conditions.

"(e) The immediate amendment of the present regulation relative to the continuous passage clause, so as to permit the entry into Canada of desirable colonists from selected countries irrespective of the fact that they may not start their journey to Canada from the country of their origin.

"(f) The adoption of more liberal regulations for the admission of colonists coming to Canada upon prepaid tickets supplied by their relatives or friends in Canada.

"We most respectfully urge that the fullest and most prompt consideration be given to the recommendations herein contained, and, in this connection, desire to direct your attention to the fact that unless a full and comprehensive policy is now adopted, the necessary staff provided and the required advertising and publicity undertaken during the coming Fall and Winter, it is safe to assume that the immigration during 1923 will be more disappointing than that of the present year."

* * * *

MAKE IT KNOWN TO WORLD CANADA WANTS SETTLERS

AS OUTLINING government policy in the matters of immigration, an important announcement was recently made by Hon. Chas. Stewart, Acting Minister of the Department of Immigration and Colonization. He states in part:

"One of our chief problems incident to getting new settlers in the rural parts of Canada is the fact that our farmers are passing through one of the most trying periods in the history of agriculture in Canada. Inflation of prices, due to war conditions and a tendency to indulge in speculative investments, had, to some extent, created a spirit of over-optimism and the pendulum has now swung the other way. After the war the prices of farm products were the first to drop, with the result that the farmer finds himself forced to pay high prices for labor, clothing, boots, shoes and other necessities while the prices of his produce have fallen, in some cases, to lower than pre-war levels. I think I am justified, however, in believing that the whole agricultural outlook justifies a more optimistic note than has for some time prevailed. Slowly but surely costs of production are going down, and there is every prospect that in the almost immediate future agriculture in Canada will be restored to its former healthy condition.

Settle Near Railways

"From the immigration point of view it must be recognized that one of the magnets which was most potent in attracting settlement to Canada in the early years of the century—the granting of public lands as free homesteads—is no longer a factor to the extent it previously was. There are still large areas of Crown lands in the hands of the government, but they are for the most part too remote from railways to be an important factor in our immediate colonization undertakings. The government is more disposed, for the present, to concern itself with the settlement of the available lands convenient to existing lines of railway which have not as yet been brought under production. Even with the lure of the free homestead largely removed, Canada is in a pre-eminent position in its ability to offer fertile and productive lands at a lower price than any other country in the world. With cheap and fertile lands convenient to railways, and with an era of agricultural prosperity reasonably within view, Canada can confidently invite settlers from other lands to take advantage of the opportunities which she offers.

Transportation Costs Heavy

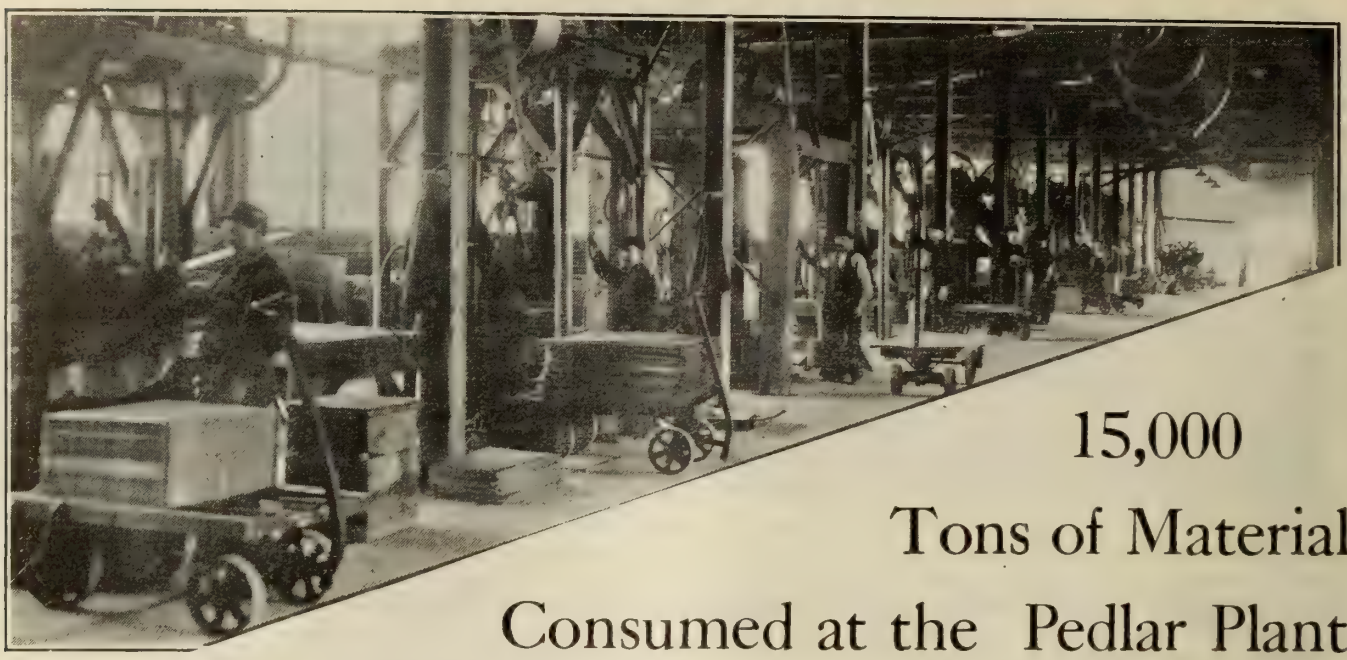
"Our agents have made reports on the possibilities in the various countries from which we hope to draw suitable settlers. The principal obstacle mentioned in these reports is the increased cost of transportation, which is at least fifty per cent. higher than before the war. This is a serious difficulty, particularly to those who contemplate moving large families—and large families are popular with us—long distances. The department has approached the transportation companies with a view to bringing about an amelioration of these conditions, and hopes that materially lower rates of transportation will result.

"Another difficulty, with respect to the settler from Great Britain, has been the discount on sterling exchange, which bears heavily upon the settler proposing to transfer capital to Canada. This condition is steadily righting itself and will probably not continue to be a barrier to British settlers with capital.

"This is a very brief outline of conditions as they exist today. In spite of the difficulties which I have mentioned I feel that there are grounds for a sane and reasonable optimism, and it is in that spirit that we propose to go forward.

Initiate Active Campaign

"These are our proposals. We propose to initiate at once an active advertising and publicity campaign in Great Britain and the United States, and to extend it into the favored countries of Northern Europe as circumstances permit. We propose to make it known to the world that Canada wants settlers, but at the same time to select only such settlers as are worthy to share in our Canadian heritage. We shall particularly seek settlers with some capital in a position to buy and cultivate the vacant lands now adjacent to our railways, but we shall also provide departmental machinery to bring the tenant farmer into touch with rental opportunities which will give him a chance to make a start in Canada. We hope, through the co-operation of the transportation companies, to see an era of lower transportation rates. We hope for the co-operation of public bodies who have the interest of Canada at heart. We realize that the development of Canada's resources by means of immigration is a big problem, and we are prepared to face it in a big way, but we feel that success can only be assured if the fullest degree of co-operation is forthcoming from the Canadian people. That the hands of the department and government will be strengthened by such co-operation from the people of Canada I have the fullest confidence."



15,000 Tons of Material Consumed at the Pedlar Plant

Showing line of drop presses for stamping steel ceilings, sidings, trimmings, etc.

Processes Arranged Along Economic Lines—Contact With Diversified Market—Export in Building Material—Complete Equipment for Auto Stamping—Description of Dies

HOW the million-dollar plant of The Pedlar People, Limited, Oshawa, converts 150,000 tons of sheet metal into products for a variety of industrial purposes, forms an interesting study in diversified routing. Established in a very small way in 1861, by the late George H. Pedlar, this concern may be said to represent a very striking example of development in manufacturing that is confined practically to one class of material. So far as market is concerned, the industry has wide contact, comprising agriculture, building, highway and railroad construction, motor car production, and special lines of activity calling for operations on machinery peculiar to sheet metal working. Metal used ranges from 30 to 6 gauge.

Main distribution considered, the output may be classified as follows:

1. For the building industry:—Expanded metal lath, steel studding, ornamental iron, copper and zinc, such as used in cornices for office and public buildings; ceilings and sidewalls for homes, semi-public buildings, stores, etc., skylights, ventilators, firedoors.

2. Farming industry:—Metal shingle and siding, eavestroughs and metal coverings of all kinds.

3. Highways and railroad construction:—Culverts of galvanized sheet metal, flumes, tanks, etc.

4. Motor car industry:—Metal stampings of all kinds for bodies, fenders, radiators. This has necessitated the construction of a large number of expensive dies, some of which are made in the Pedlar machine shop and some in outside plants.

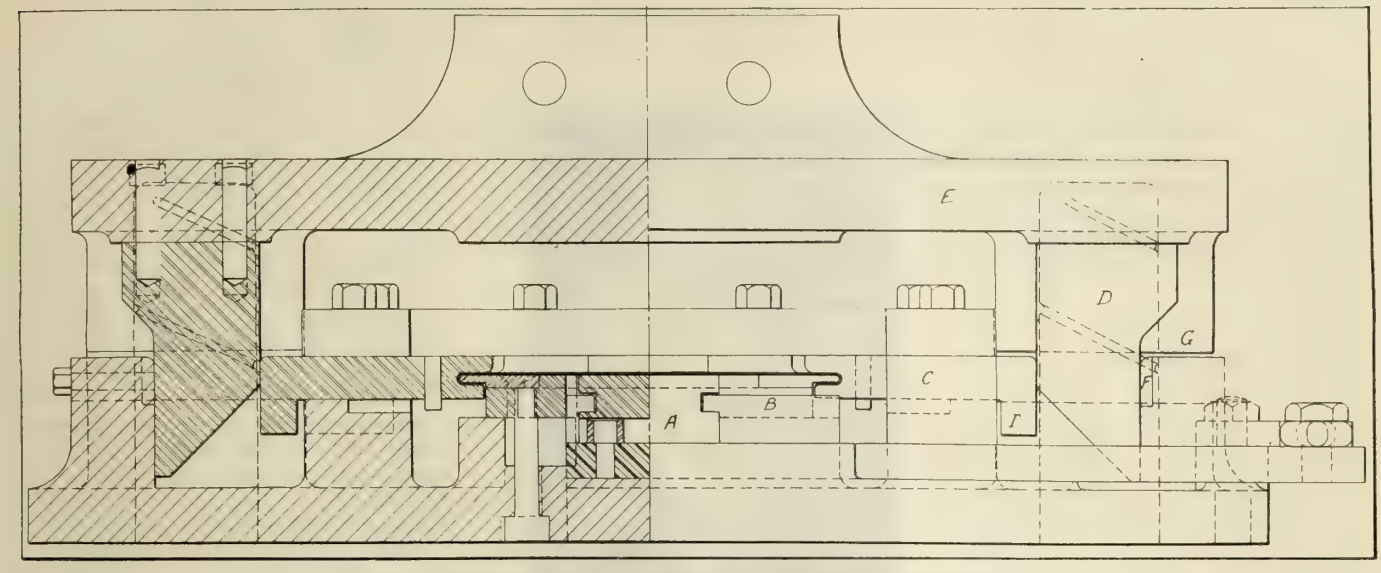
The equipment is such as to attract considerable special work, much of it calling for quantity production. As an example, a large number of specially-designed expansion plates were recently turned out for use in concrete work on the Welland ship canal.

New Plant Carefully Laid Out

In 1921 the Pedlar People moved into their new plant. This occupies an area 440 ft. by 360 ft., and is laid out with the object of departmentizing the different products having most economic operation in view. Processes move from south to north. Two railroad spurs enter from the main line and serve stock storage warehouses, one for the metal culvert, shingle and siding and metal culvert departments, and the other for the auto-stampng section.

The culvert department, occupying the extreme eastern section of the building, is served by a ten-ton Northern crane

General view of auto stamping department, 360 ft. x 83 ft. On the left i s a combination punch and rivetting machine. On the right a line of die presses. Note the hot-air distributing system on the left. This department has a mezzanine floor for light manufacturing.



Die for closing the nose of the front and rear fenders on Chevrolet car.

with 40 ft. span. Here are located the large brake or forming presses used in corrugating galvanized sheets for culverts, siding, roofing for barns, garages, etc. Here, also, are two Craig and Donald machines for the production of expanded metal such as used in concrete flooring for bridges and pavements. The metal, on being fed into one side of the machine, receives a diamond-shaped cut, after which a blade of sawtooth design descends in such a way as to expand or stretch the metal to one-half the extent of the diamond. A second strike, and the metal is expanded to full diamond mesh as seen in the accompanying illustration. Adjoining this department, is that in which expanded metal lath is produced. Here a machine of special type and design is employed. Metal of the desired width is fed in at one end, is cut, expanded in process and emerges, practically ready for the market at the other end. The superintending engineer of the Pedlar plant, F. Reesor, is now designing a machine that will produce a section of lath with a rib or stay, in the middle. This gives the lath more rigidity where there is wider spacing in the studding of a wall or ceiling.

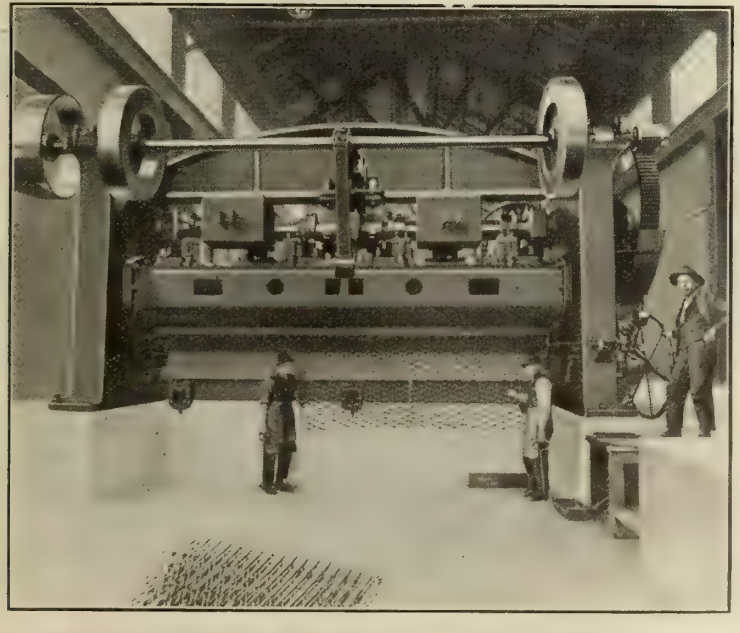
Electro-galvanizing and paint rooms are also in this section of the building, both located so as to receive work from the departments just described. The equipment of the paint room includes a machine having a trough containing the paint into which a blanket-covered roller revolves. Above this is a second roller, also blanket-sheathed, and between these rollers the sheet metal is fed. A necessary priming coat is thus applied to products requiring such treatment. The material is air dried.

Between each section of the building is a court, giving the general layout the appearance of an enclosed H. The east court contains a 50,000 gallon tank, 30 feet in diameter, for the water sprinkler system with which the entire building is equipped.

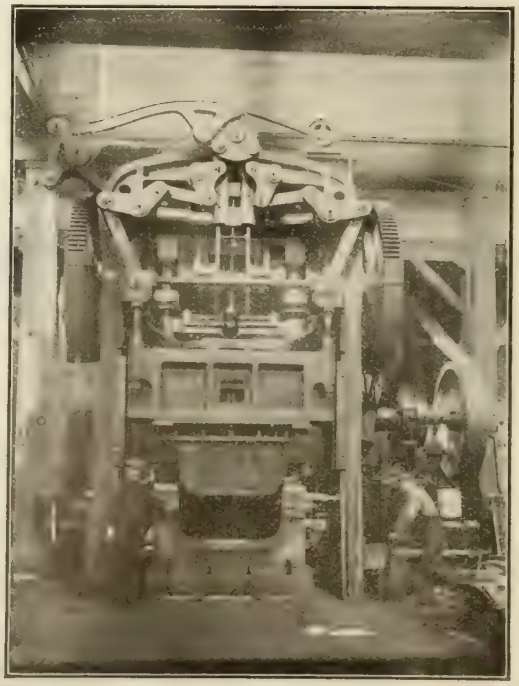
Battery of Drop Presses

The central manufacturing section is that devoted to press and stamping work. It has a floor space of 285 ft. by 70 ft., with a mezzanine floor, occupied by the cornice section, carpenter shop and knock-down garage frame department. The main floor is occupied by a battery of drop presses. Here is produced material for ceilings, sidings, etc. Some of the machines here employed were developed in the Pedlar machine shop. This occupies a space 80 ft. by 72 ft. between the central and western section of the building. Much die work is done here.

A space 360 ft. by 83 ft. is occupied



Machine for making Steelcrete Reinforcing. Width of sheets, 16 feet.



Large Toledo toggle press with die space 9 ft. wide, 5 ft. deep and 6 ft. high. Machine weighs 120 tons and is 25 ft. high.

SYNCHRONIZES WITH WORK

AS engineering head of The Pedlar People, Limited, Oshawa, whose annual output is valued at two and one-half millions, F. Reesor is a notable example of that combination of work and genius which almost inevitably locates itself in responsible positions. He admits that it was hard work that placed him where he is to-day, and they who know him intimately, declare that Mr. Reesor and industry synchronize.

Born forty-three years ago in Altona, Pickering Township, he learned the trade of machinist in the shops of the locality and was three years with Barkney Phonex and Ellis, general repair and brass works, Stouffville. Later he joined the toolroom staff of the Russell Motor Company, Toronto, and fifteen years ago, after a short interval with the McLaughlin Motor Car Co., in Oshawa, entered the employ of The Pedlar People, first as toolmaker and later in charge of the toolroom and drafting department. Opportunities were developing and by studious nights, Mr. Reesor equipped himself to select those that appealed to him. His after-hour application was such as to make him familiar with engineering problems and their solution and, in 1915-16, when the Pedlar People expanded their operations so as to take on a contract for the production of auto body stampings for General Motors, he was ready.

F. REESOR,
Superintending Engineer, Pedlar People, Ltd., Oshawa.

It was an important undertaking and while the work, in a sense, was along lines similar to those in which the plant was regularly engaged, it was new, more intricate, and called for much new equipment. Expensive dies were essential. There were those who went so far as to intimate that it couldn't be done—in a Canadian plant. However, time, a quarter million dollars' worth of equipment and the engineering of Mr. Reesor, demonstrated to the contrary notwithstanding, and successful operation of the stamping department is the result.

It required hard work, much of it running well over the time when clock-regulated operatives are wont to call it a day, but it won through, and Mr. Reesor gives full credit therefor to the co-operation of his staff.

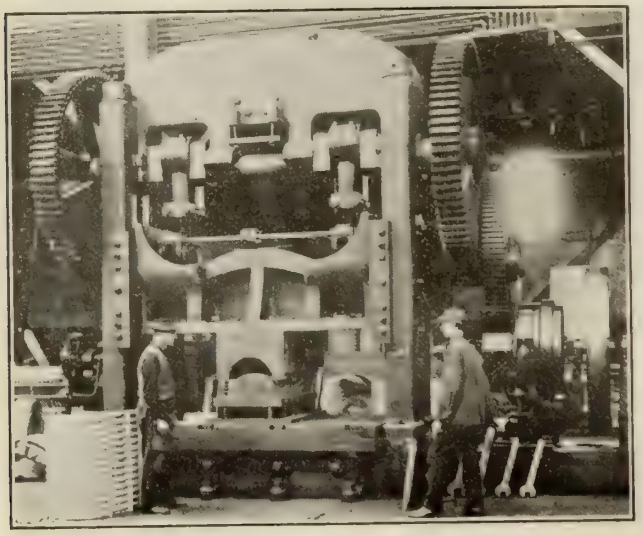
As to the extent to which the motor car business has grown, Mr. Reesor states that stamping statistics show that while die runs were about 2,000, indicating an output of that number of a particular type of car, recent runs have ranged from 20,000 to 25,000. Recently Mr. Reesor has been concentrating on the construction of a machine for the production of expanded metal lath with ribbed centre. It is an intricate looking piece of mechanism, and of course means work—but that is Reesor's hobby.

---

by the auto-stamping department. This is probably the most recent large development of the business, and was introduced in 1916 when it became evident that the plant could not be enlisted to any considerable extent in the production of war material. In connection with the shipbuilding industry, however, at a time when an impetus was developed by the urgent call for ships, part of the plant was assigned to the production of metal lifeboats, rafts, ventilators, cowls and other marine accessories.

Contracted to Produce Bodies

It was about this time the General Motors decided upon the production of the Chevrolet motor car in Canada, and the contract for making the body was given to the Pedlar People. Thus, the first industry of its kind in Canada, had its start by turning out the complete body for the Chevrolet 490. The future of the field was recognized immediately and to-day that part of the Pedlar plant has equipment to the value of a quarter million dollars. This includes a formidable array of die presses and hammers. Of the former there are four Niagaras, fifteen Toledos, three Ohls, and there is a battery of six Pettingil hammers used for forming, finishing and completing operations in stampings after leaving the larger presses. Several Quick-Work rotary cutters are also employed. There is a mezzanine floor in this department, devoted to light man-



Heavy corrugating machine.

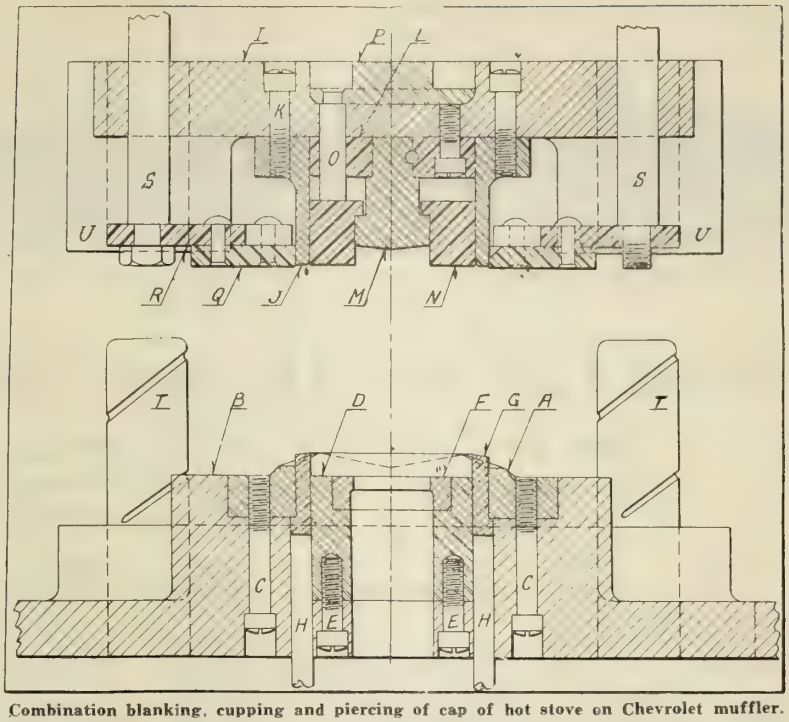
Plant of the Pedlar People, Ltd., Oshawa. Building is of brick and steel. Plan layout of the building is shown elsewhere.

ufacturing, such as the production of gasoline tanks, fender and engine-hood assembling and electric welding. Some idea of the development that has taken place in stamping production is obtained from the fact that, while original runs formerly ran from 4,000 to 5,000, at the present time motor car demand is such as to call for runs of from 20,000 to 25,000.

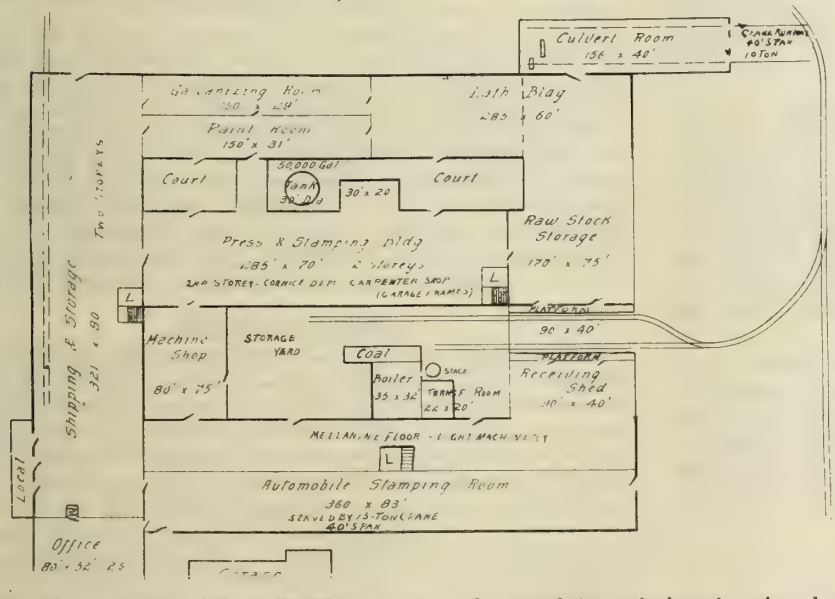
Group motor drive system is employed throughout the plant. The transformer station is located in the west court shown on the accompanying plan. The motor capacity is 700 horsepower, the average use is 350 horsepower, on a ten-minute peak basis.

One of the machine in the stamping building is a huge Toledo, double-action toggle press on which the rear, door-to-door, seat section of the Chevrolet is made. This machine weighs 120 tons, has a die space nine feet wide, five feet through and six feet high. Its height, over all, is 25 feet, and it is the largest and heaviest machine of its kind in Canada. This machine and a complete battery of presses is served by a 15-ton Northern crane, with 40-ft. span.

In the court containing the transformer station, there are located, also



Combination blanking, cupping and piercing of cap of hot stove on Chevrolet muffler.



Plan showing layout of the Pedlar plant. Process is from south to north through various departments to shipping room.

the boiler room and coal storage. In heating the auto-stamping section, three Skinner (Baetz) heaters are employed. These consist of a mass construction of enclosed coils with fan underneath. In this way the heat is discharged through large pipes or cowls. The system develops an even temperature in winter and may be employed in summer to develop air circulation.

Shipping Facilities Well Arranged

Work put into operation on the south end of the plant moves from process to process toward the shipping and storage room, 321 ft. by 80 ft. on the north. This department has two stories. It is equipped with railroad spur, under cover, and platform. There is also at this end of the building, a covered platform for use in connection with local delivery.

General offices, 80 ft. by 52 ft., two stories, are located on the northwest corner of the main building. The drafting room occupies a space along the

Motor Cars Pass Hundred Million Dollar Mark

Past Two Years Below 1920—Interesting Statistics as to Growth —Comparison in Production of Different Types—Parts and Accessories Important Adjunct—What Makers Say of 1923

By S. J. COOK,
Chief of Mining, Metallurgical and Chemical Branch, Dominion Bureau of Statistics.

PRODUCTION of motor cars in Canada at a price within reach of a very great number of people has so popularized this mode of rapid transportation that in spite of prevalent depression in many other industries and in business conditions in general, the production of motor cars has been maintained at a high level and the industry has forged its way to the forefront of national commercial progress till the annual value of its production has reached and passed the hundred million dollar mark.

The latest official statistics presently available indicate that 1920 was the banner year of the motor industry and that in the past two years the records have been considerably lower. During the last few months, however, indications have not been wanting that the coming year will be one of the busiest and most prosperous in the history of Canadian motor car manufacture. The depression of the past two years was temporary in character and natural in occurrence, the normal way of adjustment when a crisis has been met and passed.

In the review which follows, effort has been made to present to the reader in sequence the facts of the automobile industry in Canada to-day as brought out by a study of official statistics compiled by the Dominion Government. Little attempt has been made to interpret the data, it being assumed that the figures given and comparisons drawn are sufficiently comprehensive to prevent any misunderstanding of their purport.

In 1921, the automobile industry in Canada included 14 establishments manufacturing automobiles and 64 plants producing bodies and parts as compared with 17 manufacturing cars in 1920 and 62 making accessories. The total number of automobiles manufactured in Canada in 1921 was 66,246 or approximately 30 per cent. fewer than in 1920 when 94,144 were made. The passenger cars numbered 61,098, or 22,872 below the 1920 record. The decrease in the output of motor trucks was even more pronounced, the total for 1921 being 5,148 as compared with an output of 10,174 in the preceding year.

The fourteen establishments manufacturing motor cars in Canada were owned by 13 incorporated companies and one partnership. The par value of the securities issued by the 13 companies was $21,148,441 of which 77 per cent. was owned in the United States and nearly 23 per cent. in Canada. For the 35 incorporated companies manufacturing parts and accessories in Canada, the par value of the issued securities was $11,056,695 of which 80 per cent. was owned by residents of the United States and the greater portion of the remainder by residents of Canada.

In the four-year period 1918 to 1921, motor cars to the number of 325,915 were manufactured in Canada. Of this quantity, 66,246 or 20 per cent. were produced in 1921. Adopting the output of 87,835 cars in 1919 as a base equalling 100, the production of 1920 would be represented by 107 and of 1921 by 75. The output of 1921 was 23 per cent. less than the average production of the three previous years, and 30 per cent. less than the production in 1920.

The imports into Canada of all classes of motor vehicles in 1921 numbered 7,270 cars valued at $10,504,699 and the exports of Canadian manufacture were 10,726 cars valued at $5,305,444. While the exports exceeded the imports by 3,456 in number, the value of the imports was greater by $5,199,255. The re-exports of foreign cars were 254 valued at $457,657. Making the necessary computation, the number of new cars rendered available for sale during 1921 was 62,536. The value of these cars was approximately $62,100,000.

The number of cars withdrawn from use during 1921 was 11,811 as compared with 15,675 in 1920 a decrease of 25 per cent.

Passenger Automobiles

The output of passenger cars was 57,401 during 1921 or 27 per cent. less than in the preceding year and 16 per cent. below the output in 1919. With the exception of closed cars, decreases were recorded in 1920 for all classes. The production of open 4 to 7 passenger cars declined 33 per cent. in number 42 per cent. in total value and the average selling price declined from $967 each to $844 or 13 per cent. The output of runabouts was 3 per cent. lower in number and 16 per cent. less in total value; the average factory price decreased from $870 each to $751 or 14 per cent. The production of closed cars on the other hand, increased by 12 per cent. in number and 17 per cent. in total value and the average price increased by 4 per cent. from $1,222 in 1920 to $1,276 in 1921.

The increase in production was in the more expensive types of closed cars. The number of coupes made declined from 3,276 in 1920 to 3,229 in the following year and the assigned value decreased from $3,762,151 to $3,466,744. On the other hand, the output of 4 and 5 passenger cars increased by 974 in number from 4,589 to 5,563, and $1,816,528 in value, or from $5,644,403 to $7,460,931. The 7-passenger car production increased from 92 worth $314,693 to 137 valued at $460,077. The considerable increase in the output of closed cars in a period in which adverse records predominated may be taken as an indication of the growing popularity of this type in Canada, in spite of the fact that the average price was 52 per cent. over that of the open type.

The production of pleasure automobiles in Canada in 1921 was 57,401 valued at $40,607,389. Imported cars of the same class numbered 6,319 valued at $8,540,359 and the exports were 9,305 worth $4,586,664. The re-exports of passenger automobiles were 230 valued at $457,657. The resulting

number rendered available for sale in Canada was about 54,185 cars valued at $44,103,427.

Motor Truck Output

The decline in the output of motor trucks in 1922 was even more noticeable than the lessened production of passenger cars, the decrease being 49 per cent. in 1921 from the output of 1920 and 33 per cent. from that of 1919. The production in 1918 however was at a low ebb as only 2,618 trucks were placed on the market. The 467 trucks under one ton capacity produced in 1921 represented a decline of 15 per cent. from the record of the previous year, and the output of 4,681 trucks over one ton capacity was 52 per cent. below the 1920 record. The average price of the lighter trucks increased by 2 per cent. to $1,002 and that of the remaining class declined by 9 per cent. The number of freight automobiles imported into Canada was 951 valued at $1,815,723 and the exported cars of the same class numbered 1,421 worth $718,780. As the output in Canada was 5,148 trucks valued at $843,288, the number rendered available for sale in Canada was 4,657 with an approximate value of $4,940,231.

HOW CANADA ABSORBS CARS

Number of Motor Vehicles Registered in Canada by Provinces, 1915-1921

	1915	1918	1921
Alberta	5,832	29,300	40,235
British Columbia	8,360	15,370	42,900
Manitoba	9,225	24,012	40,215
New Brunswick	1,900	6,434	13,615
Nova Scotia	1,841	8,100	14,205
Ontario	42,346	114,376	206,521
Prince Edward Island	34	639	1,751
Quebec	10,112	26,897	54,670
Saskatchewan	10,225	50,531	61,184
Yukon Territory	69	87	82

Automobile Engines

As compared with the production of the previous year, the output of automobile engines in 1921 by the firms engaged chiefly in the manufacture of complete automobiles decreased 24 per cent. in number and 32 per cent. in horse power rating. The production in 1921 was 44,621 engines, of which 44,614 were of the 4-cylinder type. Of the engines made 44,591 had a rating of less than 25 horse power, and ten only were rated at 40 horse power and over.

The aggregate purchases in 1921 by the automobile manufacturing firms were 22,004 engines with a total rating of 512,311 horse power. The purchases of 4-cylinder engines were 15,270 in number, while 6,544 engines were of the 6-cylinder type. About 73.6 per cent. of the engines had a rating of less than 25 horse power while the rating of 26.3 per cent. of the engines purchased was in the range between 25 horse power and 39 horse power both inclusive. Of the 22,004 engines purchased in 1921 it was reported that 21,074 complete units with an assigned cost of $5,201,070 were assembled into cars during the year. In addition to the 44,261 automobile engines products.

Although the number of completed motor cars manufactured in Canada in 1921 was one-third less than in the preceding year, the production of engines in plants making accessories more than doubled, and in the same time the number of engines imported declined to less than one-third the number brought in during 1920. The production of motor engines in Canada in 1921, including some 44,621 made in plants when the completed car was the final product, numbered 57,349 and the number of cars made in the same time was 66,246. In 1920, the corresponding data showed that 64,526 motor engines were made in Canada, while in the same year the number of completed cars was 94,144.

Summing the output of engines in the automobile and accessory plants with the imports, in 1921 the number of engines rendered available was 67,288 as compared with a comparative figure of 95,051 in the previous year.

Parts and Accessories

An important adjunct of the automobile industry is the manufacture of parts and accessories for replacement and additional equipment required by the owners of cars. A large portion of the equipment of this nature is retailed through distribution establishments, while specialization in the manufacture of particular parts for sale under contract to the concerns manufacturing or assembling complete cars is a growing feature in the industry. The parts manufactured in 1921 by the 14 firms engaged in the production of complete cars as their chief product of value, were worth $5,149,503. The production of parts in 1921 by the 64 firms engaged principally in their manufacture was valued at $14,783,017. The total value of parts produced in both classes of industry was $19,932,520. The imports of automobile parts during the year in question were worth $11,071,420 and the exports were valued at $1,128,181. Deducting the exports and also the re-exports valued at $556,554 from the imports and production the resulting value of $29,319,205 was obtained for automobile parts and accessories made available from the above named sources for all in Canada during 1921. An examination of the list of materials used in the automobile manufacturing industry disclosed the fact that, aside from tires worth $4,616,482, the parts and accessories used were valued at $34,639,454 indicating that additional parts worth about $5,320,000 needed for use as materials in the industry were drawn from stocks or produced as subsidiary products in other industries.

The seasonal character of the industry is shown by the employment reaching a maximum in April in both 1920 and 1921. The expansion in the industry during 1919 resulted in steady expansion in the number of employees, the year opening with 3,450 on pay-rolls and closing with 9,146. The height of employment occurred in the following year, when in April, 12,090 men were employed. In 1921 the average was much lower, and the decrease from the maximum in April to the minimum in December was 47 per cent.

The salaries and wages constituted 15 per cent. of the gross value of production in 1920 while in the year under review the proportion was 14 per cent. The cost of materials comprised 64 per cent. in 1920 and 65 per cent. in the following year. The net output per employee in 1920 was $1,590 and $1,443 in the next year. The operating ratio in 1921 or the proportion of the value of production to the total expenditure was 87 per cent. The turnover, computed by taking the ratio of the current assets to the gross production was 277 per cent. The 14 plants manufacturing completed cars had an output of $67,050,209 while the 64 supply manufacturing plants has an output of $14,783,017.

Employment

The average number of employees engaged in the two classes of manufacturing plants in the automobile industry in Canada decreased 32 per cent. in the year under review as compared with 1920, the actual figures being 11,384 employees in 1920 and 7,707 in 1921. The 1,434 salaried employees were classified into four ranks as follows: salaried officers of corporations 5 per cent.; general superintendents and managers, 9 per cent.; technical experts, engineers and chemists, 5 per cent.; and clerks, stenographers and salesmen, 81 per cent.

* * * *

STUDEBAKER CORPORATION INCREASED OUTPUT

By W. G. PALMER, Sales Manager.

DURING THE past few years, over a period of extremely unsettled conditions in the automobile field, the position and progress of the Studebaker Corporation has been rather unique in so much as we have shown satisfactory and continued progress and increase in our volume, while, almost without exception, the reverse has been true.

The past few months have been extremely unsatisfactory to the industry as a whole, due to many contributing factors, but this does not in the least affect our plans and optimism for very considerably increased progress for the coming year. This year, we increased our production and sales tremendously over any previous year in our history, and are at the present time adding to our facilities, which will increase our production for the coming year by approximately 35 per cent. While we recognize the fact that this will necessitate the continued efforts of a first-class merchandising organization, we have the utmost confidence that the public will continue to recognize the sterling qualities and values of our product.

We have the utmost confidence in the immediate future of the general business situation in Canada, and believe that the coming year will show a very marked improvement in all lines of business, and particularly in the automobile business, which is one of the first to respond to improved general conditions. The progress of the automobile industry in the United States this year, is without precedent in the history of the industry, and the relations of the two countries are so close that we feel it is reasonable to expect that this same prosperity will be reflected in Canada for the coming year.

* * * *

FORD COMPANY EXTENDS PLANT

FORD, ONT.—Total output of the Ford Motor Co., of Canada, for the year, was 45,000 cars and 1,192 tractors, as compared with 46,832 cars and 3,063 tractors for the previous year. The total sales and other income amounted to $29,273,254.09. This is a reduction of $8,563,219.31 from last year and is almost entirely due to reductions in the selling prices of the product. The amount transferred to surplus, after deductions for all expenses, reserves and dividends, is $3,019,038.08, compared with $1,302,629.07 for the previous year.

Plant accounts are shown at book value and as compared with last year represent a net increase of $1,123,185.03 made up as follows: Land—$1,001,655.66 covering acquisition of 137.12 acres of land adjoining present home office plant, purchased in order to provide for additional manufacturing facilities and to take care of future expansion; buildings — $66,727.57 comprising purchase of building in which the Regina branch is located, which was formerly leased, and addition to the building in St. John, and the balance of $54,801.80 being miscellaneous additions to machinery and equipment.

Workmen are employed on a straight hourly wage, minimum 62½ cents, with increase to 75 cents after a probationary period of 60 days.

* * * *

HIGH RECORD PRODUCTION AT GENERAL MOTORS PLANT

OSHAWA.—General Motors Company of Canada set a new high record for November when they turned out 3,900 cars from their plant here. This is at the rate of 150 cars per working day, but this record will be broken in December when the sails are all set to turn out over 4,500, or nearly 200 per day. This production runs to over 45,000 machines per annum. The Company's production included McLaughlins, McLaughlin-Buicks, Chevrolets, Oaklands and Oldsmobiles. There are at present about 3,000 hands employed, and the annual payroll around $2,500,000.

On returning recently from England, where he had inspected the Company's new receiving station at Hendon, R. S. McLaughlin, president of General Motors of Canada, expressed the belief that export trade next year would exceed that of other years. At the Olympia Motor Show there were exhibited different models of Canadian production. It was evident that the smaller type of car was enjoying increasing popularity in England, one reason being the tax per horse power. As to bodies, European makers are inclined to adopt the stream line type of Canadian and American design.

Regarding certain re-arrangements of departments in the plant here, Mr. McLaughlin said that Buick closed bodies will be painted and upholstered here. This was formerly done elsewhere. Referring to local conditions he said that 3,000 names are on the payroll of the General Motors plant in Oshawa. Another 1,000 are employed at the Walkerville works; while 500 additional employees are scattered throughout the country. The local importance of this industry is seen in the fact that in all there are but 4,500 workers in Oshawa plants.

* * * *

NEW BUILDINGS FOR DURANT MOTORS

By GEO. E. PEACOCK.

DURANT MOTORS have enjoyed a very nice business and the reports we are receiving regarding the performance of these cars are most satisfactory and encouraging, and we are looking forward to the year 1923 with great optimism and enthusiasm. Right at the moment we have three new buildings nearing completion, one three storys, 400 ft. long by 100 ft. wide, another three storys, 400 ft. long by 80 ft. wide and a large train shed one story, 500 ft. long by 150 ft. wide

Our output of Durant four cars for 1923, will be approximately 10,000 jobs, and on the Star, approximately 33,000 jobs, aside altogether from export trade, the bulk of which will be handled from the Leaside plant, but in connection with which our manufacturing schedule has not yet been prepared.

We have at the present time 270 men on our staff, but as soon as our new buildings are ready and we get swinging on the new schedules (which will be somewhere along the first of the new year), we will be employing between 1,000 and 1,500 men.

* * * *

GRAY-DORT EXPECTS GOOD YEAR

By JAMES FAIRBROTHER.

GENERALLY speaking the season's operations for the Gray-Dort Company have been very successful, inasmuch as it has been entirely satisfactory in the volume of output. This is attributable, we think, especially to the creation of the new 19B special touring car and the phaeton which met with good response on the part of the automobile buying public in Canada. Shipments as anticipated at the beginning of the year, were heaviest in the provinces of Ontario and Quebec. In the spring and summer a large volume of business was done in the provinces of New Brunswick and Nova Scotia, and even in the west with its last year's handicap of a light crop and light prices, a good many more cars were taken than we anticipated.

With reference to the supposed output for 1923, we anticipate a much heavier volume of production owing to the following reasons: The stabilization of business in all lines; a good crop all over Canada, and proposed six cylinder car; new touring sedan, and the new Gray-Dort delivery truck.

FOUR WHEEL DRIVE ORGANIZES

By A. M. KERR, Manager.

OPERATIONS of the Four Wheel Drive Auto Co., Kitchener, Ont., were confined principally to establishing dealers in various points in Canada and in selling trucks locally. We were very successful in both these cases and disposed of a number of heavy duty trucks, which have given excellent service. Operations extend from Vancouver on the west through to Nova Scotia on the east. Our plans for the future are well defined. We intend to make every point at which we are represented profit by the increasing confidence in business conditions in Canada, and we expect to sell through these channels a greater quantity of trucks.

The force we employ varies according to season. We have several service men whose duty it is to look after service both locally and at any point where our truck is being operated. Some of these men are almost constantly on the road, giving advice and keeping the trucks in operation.

Our men are paid good wages, the lowest rate of pay in our organization being 40 cents per hour. Some of our better class of men are on a steady monthly salary, so that their whole time is devoted to the interests of users. The tendency on the part of most buyers is to look more for quality than they have ever done.

Canadian Pulp & Paper Industry Optimistic

Now Well on Way to Normal—Almost Double Quantity Exported —Newsprint Mills Operating Nearly to Capacity—Increase in Values—Additions to Plants Will Increase Capacity

By GEORGE M. McKEE,
President Canadian Pulp and Paper Association.

AT THE opening of the year 1922 the situation in the pulp and paper industry was not very cheerful although there were several factors of promise and encouragement for the coming year. The industry, like most other industries, had been passing through the reaction from the industrial boom of 1919-1920. The bottom of the depression had been reached and the reconstruction period was under way. In the twelve months that have passed since that time, considerable progress has been made and much lost ground recovered. There have been readjustments and economies in operation; high priced materials have been worked off and inventories written down. There have been the desire and the necessity to get down to a solid basis which should serve as a foundation for the gradual return to prosperity which is so freely predicted by careful observers and the pulp and paper industry to-day is in good shape to take full advantage of the return to better conditions. The year 1922 closes with the pulp and paper industry well on the way to normal and 1923 can be faced with a well-founded optimism.

Prosperity Depends on Export

Canada produces a great deal more pulp and paper than her population can use, hence the prosperity of this industry depends greatly upon conditions in other countries, particularly in the United States which is our best customer for these products. In that country, conditions are similar to those in Canada and the return to normalcy there has had a good influence upon the situation in that country. Our exports to the United States have been considerably increased over the exports for the previous year, although the big reductions in prices have scaled down values. As far as quantities are concerned, our exports of pulp were almost double those of the previous year and our newsprint exports were greater by almost 40 per cent.

Financial and general conditions in the Scandinavian countries have also had their effect upon the pulp and paper industry in Canada, as these countries are our competitors in the United States markets chiefly for chemical pulp. The Canadian mills have had to face severe competition from the mills of Scandinavia and Finland. These countries, like ourselves, were badly hit by the slump of 1921 and had large stocks of pulp which they were forced to liquidate with consequent forcing down of prices. We find that for the first nine months of 1922 the imports of sulphite pulp into the United States from Europe amounted to 237,000 tons compared with 71,000 tons in the corresponding nine months of 1921. However, the stocks in these countries are now reduced and as political and economic conditions in Europe tend towards improvement these imports will decline to some extent, which will be to the benefit of the Canadian mills.

Year of Record Production

Improvement has been shown in all lines of the pulp and paper industry in Canada during 1922. Production has been greater than in the previous year by from 10 to 30 per cent. Our output of wrapping paper was more than double the output last year and our production of newsprint increased by nearly 40 per cent.; our exports of book and writing paper gradually increased during the year and while not equal to last year figures, showed steady progress. The newsprint industry has done best from a production point of view. For various reasons there was in the past year a tremendous increase in the consumption of newsprint paper in the United States and the quantity used broke all records. As Canada supplies about one third of this newsprint our mills have been operating nearly to capacity during the greater part of the year. Taking the Canadian and United States market as a whole the production of newsprint has kept ahead of con-

Paper mill; 7. Townsite, built in the wilds; 8. Golf course, one of many means of entertainment provided. This is what is termed an "oblique" photograph of the Laurentide Company's plant at Grand 'Mere, taken by the Fairchild Aerial Surveys Co. (of Canada), Limited.

sumption by only about one per cent. Present indications are that this state of affairs will continue for some time and that Canadian mills will be kept busy during 1923.

The steady decline of prices for pulp and paper which began in 1921 and continued into 1922 showed signs of coming to an end in the fall of 1922 and prices tended to stiffen slightly at that time. Pulp prices increased $5 to $10 per ton and newsprint prices were raised $5 a ton for the first quarter of 1923. This, together with the increasing demand for all grades of paper and improved outlook for business generally, gives an optimistic outlook for 1923 and shows justification for the faith that the Canadian manufacturers had in the fundamental soundness of their industry.

The following details of our export of pulp and paper will serve to show what progress has been made in that direction during the year, and to compare with the year 1921. Quantities are given where possible, as the fluctuations in prices rather nullify the inference to be drawn from values:

First Ten Months of 1922

	Mechanical Tons	Sulphite Bleached (Tons)	Sulphite Unbleached (Tons)	Sulphate Tons
January ..	28,608	12,470	11,120	9,807
February .	13,222	8,715	10,145	11,437
March	19,525	9,842	14,988	14,415
April	6,448	8,149	8,317	8,162
May	11,912	16,835	11,277	12,575
June	37,556	11,919	21,500	13,109
July	26,873	13,312	24,679	12,887
August ...	39,758	15,033	17,355	12,658
September	36,968	11,419	28,154	13,503
October ...	26,435	18,075	18,411	14,088
Total 10 months 1922	247,305	125,760	165,946	122,641
Do., 1921	150,344	53,380	88,014	73,016

The figures show the big increases in exports of pulp that took place in 1922 compared with 1921. Mechanical pulp exports increased 64 per cent., bleached sulphite 116 per cent., unbleached sulphite 88 per cent. and sulphate 68 per cent.

United States Big Buyer

Of our exports of mechanical pulp, the United States took 141,000 tons, Great Britain 79,600 tons and France 24,500 tons. Our best customer for sulphate pulp was the United States with 224,000 tons out of a total of 292,000 tons, followed by Great Britain, Japan and France in that order. Our exports of sulphate pulp all went to the United States. The table below gives the exports of various grades of paper for the first ten months of the year.

	Newsprint Tons	Kraft Wrapping Tons	Book Paper Cwt.	Bond & Writing Cwt.
January ..	67,701	1,358	118	250
February ..	70,729	1,633	1,112	227
March	95,196	1,467	86	202
April	61,452	638	35	563
May	75,783	651	562	1,355
June	86,479	2,185	1,214	839
July	77,004	1,826	6,177	1,574
August	84,023	1,922	6,684	1,301
September .	79,557	1,675	4,675	1,840
October ...	81,552	2,183	6,983	2,298
10 Mos. 1922	779,476	15,508	27,646	10,449
10 Mos. 1921	569,431	5,052	32,134	22,022

It will be seen that our exports of newsprint and wrapping paper are very much ahead of last year's figures for the corresponding period, newsprint being 37 per cent. greater and wrapping paper 207 per cent. greater. Book paper and bond and writings are behind last year's figures due to competition and decline in demand for these classes of paper, but the figures show great improvement during the year and demand is picking up in these lines. For newsprint our best customer was the United States, which took 720,000 tons, followed by Australia with 29,000 tons and New Zealand with 11,000 tons. Book paper went principally to Australia and New Zealand with Great Britain a poor third. Bond and writing paper also went chiefly to Australia and New Zealand with Great Britain not far behind. For Kraft wrapping paper Great Britain took the larger share, followed by Japan and Australia.

Canadian pulpwood exports are naturally a factor in the situation and of this raw material we exported in the first ten months of 1922, 860,936 cords valued at $8,872,392 compared with 997,698 cords valued at $13,522,576 in the corresponding period of 1921. These figures also show the decline in the prices of pulpwood that took place during the year. All the pulpwood was exported to the United States, which relies on Canada for a large amount of pulpwood annually in order to help out its depleted forest areas.

Increases in Value

It has been said previously that quantities give a better idea of the size of the industry than values, owing to the fluctuations which the latter have undergone in the past twelve months. As a big factor in our export trade, however, we might here mention that the total exports of Canadian pulp and paper for the first ten months of 1922 amounted to $94,198,335 compared with $88,877,237 in the corresponding months of 1921. These amounts were distributed between finished paper and pulp as follows:

	Paper	Pulp	Total
10 Months 1922 ..	$60,972,720	$33,225,615	$94,198,335
10 Months 1921 ..	63,660,837	25,216,400	88,877,237

Thus, in spite of the decline in prices, there was an increase in 1922 of $5,000,000 in value, the value of pulp exports having increased by $8,000,000 and that of paper having declined $3,000,000.

Additions to Plants

During the year there have been various additions to existing plants and new plants put into operation. The early part of 1923 will see at least four new newsprint machines in operation with others to follow during the year which will increase the capacity of Canadian newsprint mills to over 4,000 tons per day or about one and a quarter million tons per year, a big stride forward from 1913 when our total production for the year was 350,000 tons.

There are also various additions to our producing capacity in pulp and fine papers under construction or planned, which should make the year 1923 one of record production for Canada and show that this industry has established a firm hold in the country and a high place among the factors tending to its prosperity.

More new stations had been added to the system of the Bell Telephone Company up to the end of September than during the whole of last year. The development of the company shows rapid progress, from 40,000 subscribers in 1900 to 425,000 in 1922.

Lumbering Industry Viewed With Confidence

Building Industry Active—Mill Yard Stocks Moving Out—Extensive Operations in the West—Production as Well as Demand is Increasing—Extensions to Plants Proposed

By G. B. VAN BLANCOM, Editor Canada Lumberman.

IT IS MUCH easier to review than to forecast. What has taken place in the lumber trade during the past twelve months is an open book. The developments of 1923 are yet to arrive, and while not making predictions with respect to prices, production or distribution, it is safe to say that all members of the lumber industry are looking forward to the coming year with greater confidence and more steadfast hope than they did in the one from which they are now emerging.

Representative men in the manufacturing, wholesaling and retail branches of forest products activities agree that 1922 showed a decided improvement over 1921 in turnover, demand and value. The past year has been one of liquidation, recovery and readjustment, after the slump which followed the boom period of 1920 when runaway quotations prevailed and all transactions in the timber trade resembled an auction market, so clamorous was everyone for stock and so insistent on getting it.

In 1921 conditions were almost diametrically opposite. Everyone was seeking to unload; no one wanted to purchase beyond actual requirements, and values shrank until they were below the cost of production. Toward the end of 1921 some confidence began to express itself but logging operators, although wages were low and men plentiful, did not believe in plunging too heavily and undertook cutting on a very moderate scale. The future was unknown and as lumbering is a long-range game, highly speculative and dependent upon more accessories in the way of climate, finance, labor, traffic, commercial and other conditions than any other national undertaking, its exponents restrained their activities.

Benefit from Building Boom

Early last spring a building boom set in in the larger cities. Houses went up in all directions and the aggregate of permits issued in the bigger centres of population topped all previous showings. This naturally created an unprecedented demand for hemlock, white pine, B. C. fir, jack pine and spruce. There were ample stocks left over from the year before to meet the requisitions for the first few months but as structural undertakings multiplied, a shortage developed in certain widths and lengths and it was necessary to substitute other woods if progress was to be made. Owing to the mild weather in the early part of December, building continued to be brisk right up to the end of the year and the prospects are that as the housing situation has by no means been met as yet, 1923 should be another period of activity and expansion. While a large trade has been done in softwoods, it is doubtful if many dealers have made much money owing to the fact that they had high-priced stocks on their hands which they had to get rid of before their business was on a firm footing. Operators of planing mills were kept on the move and toward the end of the year mill culls, which had been very low in price, began to be called for, showing that stocks of the better grades were getting lower.

Corner Turned in Hardwood

In hardwoods, which depend mostly upon industrial expansion for their demand, business was quiet for the first eight months and there was a wide spread in prices with few sizeable sales transactions except those made to automobile manufacturers. Furniture plants, agricultural implement works, piano and gramophone concerns were pretty well stocked up and were only running at part capacity. During the last few weeks, however, conditions have materially changed and representatives of these industries have entered the market to replenish their supplies. The lower ends, which at the beginning of 1922 were ridiculously low in price and accumulating in quantity, began to move, which is an indication that the corner has been turned in the hardwood arena and things are now headed in the right direction. Industrial activity is increasing and with its revival, the call for birch, maple, elm, oak, ash, etc., has grown appreciably. While a fair trade was done in hardwoods during the latter part of the year, the major portion of the demand came from the large consuming centres across the border. If wholesalers and producers had had to depend upon local consumption, they would have been sadly disappointed.

In New Brunswick and Nova Scotia the English stock of spruce deals—an aftermath of the war purchasing period—has at last been cleared out and Canadian cuts are now beginning to move. The demand for spruce from the United States has recently been pronounced and the English market is prepared to take a considerable quantity of deals and scantling. Prices on all lines of lumber show a tendency to stiffen owing to the improved market conditions, the brighter outlook, inquiries both from across the border and overseas and the ever-increasing use of wood products. The cut this year will be heavier in every province than it was last season and the increase is variously estimated from 10 to 40 per cent. over what it was last winter.

Stocks in mill yardu are also moving out freely and inventories will show that producers have many million feet less on hand than they had at this period last year. By some it is thought there may be a shortage of dry stock early next spring as lumber to-day either in hardwoods or softwoods, is in fewer hands than it was several months ago. This is evidenced by the number of stocks that have been sold to wholesalers and the way that manufacturers have been shipping out carloads since their mills closed for the season.

Demand for Bushmen

The number of men available for the bush, while none too plentiful in the early fall months, is now thought to be ample in most sections and wages have been pretty well established at $35 a month, with board. A few operators are said to be paying $40. Last year the figure was from $26 to $30, so that on the whole the wage advance is about 25 per cent. more than in 1921-22. This augmented outlay, however, has been offset to some extent by the reduced rates for camp supplies, but the consensus of opinion is that logging costs will be higher than they were last season. The estimates vary from 5 all the way up to 25 per cent., according to authentic advices.

With respect to prices, no one in the lumber industry desires to see a runaway market and ardently hopes for an equalization of production and demand.

Looking over the whole situation, it is believed that 1923 will be one of normal activity in the trade, a steady call for all good grades of lumber and a tightening up in prices that will enable producers to make a fair profit on the money they have invested in the enterprise and the arduous work they undertake in converting the raw material of the forest into the finished product, for the welfare and happiness of mankind.

Of late weeks the shortage in cars, embargoes, congestion at terminal points and other obstacles have interfered somewhat with distribution and deliveries, but the difficulties are gradually being surmounted and it is believed that the worst has been experienced. Traffic managers now report that transportation is gradually getting down to a normal basis.

1923 Should Be Good Year

In view of past upheavals, it is not safe to prognosticate but, in the opinion of nearly all representative lumbermen, 1923 should be a pretty fair year for the business. All speculative and fictitious elements have long since spent themselves and both consumer and producer have had sufficient experi-

ence to desire no repetition of the abnormal values which held sway a little over two years ago. The reaction has been long and somewhat painful and now that things are down to a stable basis, there will be a greater degree of satisfaction all around. The one fear is that prices may ascend too rapidly, with the result that there may be a relapse, and against this the conservative solid element has set its face.

The situation may be comprehensively summed up in the words of a Northern operator who in conversation the other day with the writer said: "Stocks are low, production will increase, but so will demand. The lumber trade to-day is brisk and we see no immediate sign of its changing. With the bountiful harvest of the past season, the fine weather for building which has been prevailing, coupled with a determination of the Canadian public to face all difficulties and make the wheels of commerce revolve smoothly, we see no reason to be other than optimistic for the coming season. We do not look for a record-breaking year but for one of normal activity and a gradual strengthening of prices, particularly on the upper grades."

It has been asked if the present revival of prosperity is not merely a spurt of "secondary inflation," soon to be followed by another long period of business lethargy and unemployment. The answer of those who have given close study to the situation, is that there will be continued activity for the construction and lumber industry. The housing demand has not yet been met, the railways are contracting for many new freight cars and industrial consumption is likely to increase. The prospective augmented demand, together with the changing conditions in the lumber arena, are such that it will likely be taxed to the utmost to meet the calls that are placed upon it. Each year the source of supplies becomes more remote, the drives or hauls grow longer, the character of the timber smaller and overhead expenses heavier.

There will never be a return to the low level of prices on lumber that prevailed before the war any more than there will be in any other national commodity of daily consumption. The era of pre-war quotations is a memory of the past, but, on the other hand, proportionate to the risk assumed, financing required, cost of production, etc., lumber is selling to-day cheaper than many allied lines.

Plants Being Extended

The best indication that 1923 will be a better year in the lumber line than 1922 is that manufacturers of equipment all report an ever-increasing number of inquiries. Several operators are extending their plants, and those mills which have been wiped out by fire are being rebuilt on a larger scale. Concerns which have done little or no logging for several years are once more entering the bush, all of which portends that greater confidence has been established and business is now on a much more settled basis. This improvement is noted all along the line and with "a strong pull, a long pull and a pull all together," the lumber industry for 1923 should bring with it a larger measure of satisfaction and monetary returns than has been experienced since the collapse of high prices in September, 1920, when the word went forth to unload and cancel contracts and values dropped almost as suddenly as a mist clears before the rising sun.

Fundamentally and economically, the outlook for 1923 is reassuring, and as one eastern operator says, "Most of the wise men down here are preparing to supply a normal quantity. They believe there will be a lively demand, firmer prices and a larger volume cut to meet the ever-increasing call for wood products."

SOME FACTORS IN POWER TRANSMISSION

(Continued from Page 113)

It is always advisable to use pulleys as large as possible, as the action of the belt in passing over small pulleys creates stresses in the belt that add greatly in shortening its life. The percentage of the pulley circumference in contact with the belt has a vital effect on the friction between the two elements. It is obvious if the belt contact exceeds 180 deg. the friction will be greater than when less than half the circumference is covered. At the same time it will be understood that what is gained on one pulley of a connected pair is lost on the other. However, when the slack side is on top any sag in the belt when operating under load will add to the power factor. If an idler is used it is best located near the smaller pulley and on the sagging side of belt. A glance at Fig. 1 will show the advantages of proper installation of vertical or oblique drives. The ideal belt drive is the horizontal, but this condition is not always possible so that some alternative must be resorted to. In Fig. 1 the drive shown at A would be very inefficient as the contact on the small pulley is reduced as the speed increases. That shown at B is better as the effect is not so pronounced when the large pulley is the driven and at the bottom. Vertical drives should not be encouraged and some modification between it and the horizontal will give better satisfaction. A serviceable drive is shown at D, where the sag of the belt due to load causes the belt to increase its wrap around the small pulley and thus add to power transmitted. The efficiency of a belt when running horizontally will be reduced about 30 per cent. when operated at an angle of 70 degrees.

CANADIAN MINING INDUSTRY HAS PROMISING OUTLOOK

By WYATT MALCOLM, Geological Survey.

WHAT BENEFIT does Canadian industry as a whole obtain by reason of the mining industry? Some interesting statistics were recently submitted to the Ontario Mining Association by the secretary, H. B. Neilly. In arriving at the percentage distribution of funds spent for mining supplies, the disbursements of a north country gold producing mine were taken as the basis. It is, of course, apparent that the conditions at no one mine can properly be taken to represent all the mines. Had a Sudbury nickel mine been taken as a basis, the freight and fuel expenditure would have been proportionately much higher. Had it been a mine increasing its capacity and equipment during the period, equipment cost and customs duties would have increased. This then is an estimate, based upon the data available and sufficiently correct to indicate the market possibilities arising out of the development of the mining industry. The year 1920 is taken as a basis, but since that time there has been marked development, especially in the gold mines of Northern Ontario. It must be borne in mind that, apart from mines altogether, millions of dollars are being spent in hydro electric power development, road building, etc., in order to more adequately serve this thriving industry. Supplies, etc., purchased in 1920, amounted to $30,492,249, distributed approximately as follows:

Ball mill liners, castings and machine shop work	13.00%	equals	3,963,993
Customs duties	1.00%	"	304,923
Chemicals and apparatus	9.36%	"	2,854,074

Training of Boys in Shop and School

Class in Session at Technical School.

Practical System Developed in Grand Trunk Shops — What the Technical Schools Are Doing to Meet Requirements of Industry

Do Technical Schools Meet Industrial Demands?

How Does it Apply to the Practical Side? Passing of the Old Apprenticeship System—Developing Industrial and Technical Efficiency—Description of Industrial Courses—Results Obtained

From the Viewpoint of an Instructor

"TECHNICAL EDUCATION means that those who are engaged in Industry should have a trained intelligence and an understanding of the special industries which enter as bread winners."—Playfair.

AS A DEFINITION of technical education, the above quotation is broad but not concise. In the minds of many the terms industrial, technical and vocational training mean the same thing.

The Royal Commission appointed by the Dominion Government in 1910 to report on the "needs and present equipment of our Dominion of Canada respecting industrial training and technical education," defined in their report industrial training as "the actual teaching of skilled labor, as formerly done by the apprenticeship system,—" while technical education was defined by them as follows: "A course in the principles and appliances of the sciences for the purpose of preparing men and women for professions and occupations requiring trained intelligence, skilful manipulation, and more than the usual store of information." Vocational training on the other hand means training along the lines of any calling, whether industrial, professional or otherwise, to which one may be particularly adapted on account of special physical or mental abilities or genuine interest.

It is generally understood that the apprenticeship system of industrial training is dead. This is almost true regarding the articled apprentice, between whom and the employer there exists a contract stating the duties and obligations of each toward the other.

One of the chief causes, though there are many others, for this condition is the many opportunities for the employment of unskilled boys at relatively high wages, and the shortsightedness of parents, who are more anxious to have the boy earn as high wages as possible immediately, than to learn a trade which would insure relatively steady employment in his maturity. Due to the system under which factory production is carried on, employers are no longer able to provide apprentices with the opportunities for the mastery of all details of a trade as was done by the old time masters.

Under the old system, the apprentice, by working on all operations in connection with the product, acquired a wide and varied experience, which while developing a skill of hand, gave technical understanding. Because of the highly organized manner in which industries are now conducted, employees are generally given opportunities to develop skill and understanding in only one or two processes of the work. This does not tend to produce a thorough technical knowledge of the work as a whole, but, especially on piece work systems, has the tendency to keep a man in the same small job, which he can do rapidly and skilfully for relatively high wage, while he pays little attention to the other processes in the industry. These conditions hamper greatly the development of good all-round mechanics. The use of automatic machinery, and the consequent division of labor, are reducing the need for the all-round mechanic, but it is only from this class, and not from the handy-laborers or machine tenders, that foremen and factory superintendents can be developed.

Special Training for Foreman

Probably no educational factor in industry has been so emphasized by the war as the need of special training for the foreman. The character of his job has changed, and his importance has increased. He determines certain factors which decide whether production is on an economical or a wasteful basis. He also represents the management, or may do so, in the new relations with employees. He is no longer employed to "hire and fire," but to organize, assist the accounting department in analysing costs and reducing them, to co-ordinate more closely with other departments and to maintain good personal relations with his men as representative of the management.

From the above it can be seen that upon leaving the elementary schools boys have not the same incentive in entering a trade or industry to become masters of it as under the old apprenticeship system. What are we doing to counteract this influence? With the application of science to industry, workers, to be suitable for advancement, require a technical knowledge of the industry, but present industrial conditions do not favor the gaining of this knowledge while on the job. On the other hand, thorough instruction in the theory, apart from practice in the actual work, will not qualify the young industrial worker. The following paragraph is taken from the report of the royal commission above mentioned:

"While the interests of the employer and the employee alike require efficiency in the doing of work, it is recognized more and more that there is a difference between industrial efficiency and technical efficiency. Industrial efficiency may represent ability to do work quickly and well, while technical efficiency may represent ability to plan, to understand, and so to direct the activities and operations to advantage. There is an essential difference between industrial

technique and industrial intelligence, as there is between skill of hand and the scientific spirit in work. As far as possible the aim of industrial training and technical education should be to develop both kinds of ability. From them result power and willingness to render efficient service." What is required in our future foremen and superintendents, etc., is a combination of the two above described types of efficiency.

Technical and Industrial Schools

To assist in the production and training of the all-round mechanic for the various industries, technical and industrial schools are in operation, under government supervision in most countries. More or less assistance in this direction may also be obtained through the agency of correspondence or private trade schools. Correspondence courses are a valuable aid to those who can not attend school or college, provided that the lessons and instructions be carefully prepared, the problems practical and the supervision and examinations be by teachers thoroughly acquainted with the subject.

This plan has been commercialized and abused, but substantially it is sound, except where field or laboratory work is essential and facilities therefore are not available to the student. The cost of instruction through correspondence schools is in general high, because most of this type of school have been developed as a commercial venture which must pay dividends to the promoter as well as running expenses, and their source of revenue is from students' fees and books sold to the students.

Municipal or governmentally owned technical or industrial schools, which need be only partially, if not all, self-supporting through the pupils, will obviously be able to offer instruction at a lower cost to the student. In order that the employees who form the bulk of the students of technical schools may be educated in citizenship as well as in trade it seems important that the government should be a party to the education of wage earners.

Examine Opportunities Offered

In considering ways and means of achieving to a greater or less extent the desirable aims of technical education as outlined above, we can do no better than to examine the opportunities provided for technical training in Ontario. Under the Vocational Education Act of 1921, the department of education of Ontario has made certain regulations, among which two types of technical schools are provided for, namely ,—"industrial schools" which are defined as follows: "To give boys and girls looking forward to employment a thorough training in the essentials of a general education and at the same time to furnish a special training in the subjects and operations which are fundamental to the trades and industries in which they expect to become employed," and "technical high schools," which are planned to meet the needs of those who are looking forward to occupying junior executive and technical positions in the trades and industries or to proceeding to higher institutions for advanced training in technical and engineering lines."

Throughout this discussion we shall confine our remarks to the training offered in the type of school described above as "industrial," those schools classed as technical high schools being apparently designed to meet the needs of those entering the office end of industrial work, or the universities.

Aims and Objects of Industrial Schools

It will be noticed that the primary object of the industrial schools as described above is laid down as being "a thorough training in the essentials of a general education." This is for the purpose of developing in the pupils a high type of citizenship by broadening the vision to the point where an intelligent interest can be taken in civic and political affairs and community movements. It is in respect to such general training that the majority of the courses given by correspondence schools or private trade schools are to be found wanting; for although most of these schools will give this general training, for a further financial consideration, if desired by the pupil, it is not an enforced part of any of their courses in industrial or technical work, and for these reasons is more often neglected by the pupils.

The secondary object of the industrial type of schools in Ontario is "to furnish a special training in the subjects and operations which are fundamental to the trades and industries in which they expect to become employed." In the organization of the detailed work in such schools it is found that many of the subjects of study and some of the operations are fundamental to several of the trades and industries for which the pupils are being prepared. It is therefore possible to have a common course of instruction applicable to nearly all the trades or industries during the elementary part of the training. This is specially desirable when boys enter such schools before deciding upon a particular trade or knowing to which industry they are best adapted.

Selection of Vocations

As an industrial course of study progresses, the various trades must be segregated and the various groups given detailed instruction and practice in the actual work of the respective trades chosen. Before this segregation can take place the pupils, in the case of young boys, must choose which industry each proposes to follow. This is preferably done with the help of the instructional staff who can advise each pupil as to his adaptability to particular classes of work as a result of their observation of his progress or efficiency in the various general operations and subjects taught, having regard to the industries in the district which will be likely to absorb mechanics.

To assist in an advisory capacity in the work of choosing the most suitable vocation for each boy, the Vocational Education Act provides for the appointment of one or more coordinating officers for each school to study industrial conditions in the district and thus be in a better position to advise the students as to which industry is most likely to be suitable to each student, also to bring the work and the pupils of each school to the attention of employers, etc.

The above mentioned regulations provide that previous to the starting of an industrial school, the committee in charge and the principal make "a careful survey of the trades, industries, and pursuits of the district for the purpose of discovering the subjects in which it is desirable to offer instruction, and of determining the kind of instruction that will meet the needs of the community."

Employers on Committee

Schools of the industrial type in Ontario are under the management and control of an advisory industrial committee, consisting of eight or twelve members appointed by the high school or board of education under whose jurisdiction the school is instituted. One half of the members of the committee are elected members of the board, including one member representing the separate school board. Another twenty-five per cent. of the members of the committee, not members of the board, are to be chosen from among employees in the industries carried on in the municipality or district. The remaining members, not members of the board, are chosen from among employers of labor or directors of companies employing labor in manufacturing or other industries.

This arrangement places the control of the school in the hands of a body, one half of whose members are responsible to the electors, and whose term of membership terminates with the expiration of the period for which they were elected to the board. This is necessary in order to keep the actions of the committee within the approval of the public.

The other half of the committee, being equally divided between employees and employers, is intended to be more of an advisory nature as to types and courses of study required in the school. These industrial members of the committee may be appointed for terms up to three years. Provision is made for cases in which the committee may desire further representation within itself of some important industry in the community, by the appointment of "co-opted" members, equal numbers of which must be employers and employees.

It is seen from the above that it is intended that these schools should have available the proper kind of advice on local industrial conditions and therefore determine upon the course of study for its students in that light, although all courses of study offered must be approved of by the minister of education.

The National Association of Manufacturers of the United

States has declared in convention that: "Failure has marked every attempt at vocational education not directed by employers and employees from the vocations, thereby assuring that the instruction given shall justify the confidence and hope of students, parents and the vocational interests whose co-operation is essential."

In respect to the choice of courses of study pertaining particularly to local industries, the following abstract from a paper by Leonard P. Ayers on "Studies in Occupations" is of interest. This paper recorded the results of the study of certain facts concerning the thirteen-year-old boys in the public schols of seventy-eight American cities "This inquiry disclosed the facts that among the fathers of these boys only one in six is now living in the city where he was born, and that among the boys only a little more than one-half are living in the city of their birth. These facts seem to indicate that vocational guidance must have a broader outlook than that which relates solely to the local industries; for if present conditions maintain in the future, one thing that we can be sure of is that many of the young people of any given community will eventually find their life work in some other community."

Courses of Instruction Provided

The regulations respecting industrial schools in Ontario provide for any or all of the following courses of study:

(a) Full-time day courses covering three or four years, designed to give, as a basis of citizenship, an extension of their training of the essentials of a general education, and at the same time a specialized training in the subjects, processes, and operations which are fundamental in the fields of work to which the school concerned is most closely related. The majority of students entering these courses will be boys between the ages of thirteen and eighteen years.

(b) Special day school courses planned to meet the needs of such classes as men working on night-shifts, or those temporarily out of employment.

(c) Part-time courses to cover the requirements of (1) those adolescents who are required to attend part time classes by virtue of the Adolescent School Attendance Act, and who choose to enroll in an industrial school; and (2) those who may attend part time classes by virtue of co-operative agreements between employees, employers and the school concerned.

(d) Evening courses where training along industrial and related lines is offered to men and women at any stage of their career.

Subjects of Instruction

In considering the subjects of instruction which have been chosen to as nearly as possible satisfy the purpose of this type of school, we can do no better than examine what is being done in the premier institution of this kind in Canada, which is said to be the finest of its kind on the American continent, the Toronto Technical School. The courses of instruction offered in this school to boys and men in industrial work are here described in as few words as possible.

Full Time Day Industrial Course

Government regulations require that during the first two years of this course the time devoted to the study of general subjects, which include physical training and hygiene; English literature, composition and grammar; history, civics and elementary economics; arithmetic, geography and elementary physics, should be substantially equal to the time spent on special vocational subjects. It has been found convenient in the Toronto school to have the boys entering all the industries or trades receive the same type of instruction, including the following industrial subjects: Woodworking, sheet metal work, electric wiring, foundry and forge work, simple machine shop operations and printing.

At the beginning of the third year each boy may choose to follow a certain specialized line of study according to the class of work to which he appears best suited. Government regulations provide that during this year at least thirty per cent. of the total instructional time must be spent on general subjects, at least thirty per cent. on drawing and other practical work, while the balance must be devoted to mathematics and science and a study of materials related to the needs of the industry chosen. The special work outlined for each trade in this year overlaps to some extent with that of other trades in order that mistakes in choice of trade may be rectified without too complete change of work.

In the Toronto Technical Schools the following trades are specially provided for with a particular course of study, while others can be introduced if a demand arises: Architects, builders, machine trades and mechanical draftsmen, plumbing, heating and sanitary engineering, printers, painters and decorators, surveyors, electrical workers, steam engineers, watchmakers, industrial chemists and automobile mechanics.

The fourth year is a more specialized continuation of the work of the third year. In this year only fifteen per cent. of the total time need be spent in general subjects and the same amount of time on drawing and practical work, while the balance of the time may be spent on the study of materials, science and mathematics, bearing directly on the trade or industry chosen.

Special Courses

These courses are given in any of the subjects of regular instruction in the school, and may be of any duration depending on the amount of instruction desired by, and the capabilities of. the student. These courses are laid out to assist the student in the better understanding and execution of the work on which he is employed or for which he is preparing.

Evening Courses

Courses are offered in all subjects which will best help the industrial worker to make progress in his vocation. Most of these courses occupy two hours an evening twice a week from October to March inclusive, some of them extending over three or four years for the complete course.

Choice of Instructors

The National Association of Manufacturers of the U.S.A. declared that: "It is essential that the teachers in vocational schools shall have had extended experience in actual employment in the occupations taught to the end that the instruction be practical and meet actual conditions." It has even been emphasized recently in England that a reasonable proportion of teachers in continuation and technical high schools should have had practical training or trade experience, even though the trades are not taught there.

The majority of expert workmen are, however, unable to impart to others the knowledge which their experience gives them, and it is thus necessary that industrial instructors should have some training as teachers, that they may understand the learning process in the different types of pupils which they may have under their instruction, and in order that they may arrange the work of their subject in the best order for presentation in the class to provide for progressive work.

The Ontario regulations regarding instructors of this class are as follows: A fair general education, training and experience in the subject taught to be approved of by the Minister of Education, and training in teaching and school management approved by the minister. In order to procure a permanent certificate as an industrial teacher one must have had at least two years' teaching experience in Ontario approved by an inspector. It is thus seen that the instructors which can be chosen for this type of schools are thoroughly qualified for the work which they have to do.

Results of Technical Education

The results of technical education as applied to industry can not better be summarized than was done in the report of the Royal Commission above referred to, as follows: "All evidence which has come to the commission indicates that workers who have been trained in shop and factory, in connection with the instruction and experience of industrial and technical courses, are more efficient than those not so trained. The wages which the technically educated earn are confirmation of that."

How Apprentices Are Trained in G.T.R. Shops

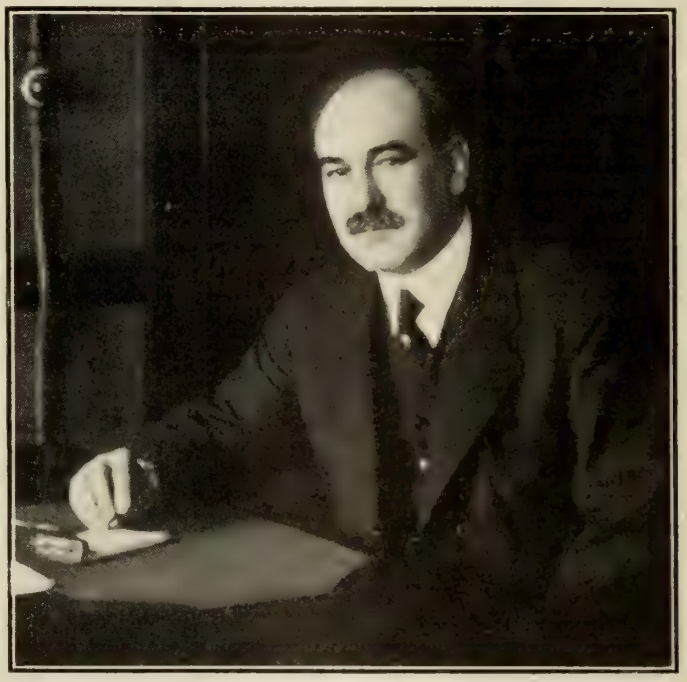
High Standard System of Education Has Been Built Up to Meet Demand for First Class Mechanics—Skilled Instructions Employed—Seldom Necessary to Go Outside to Fill Vacancies

By J. C. GARDEN,
Superintendent of Motive Power, G.T.R., Montreal.

THE GRAND Trunk Railway System is one of the pioneers in the systematic education and training of apprentices. The energizing influences of the officials of the motive power and car departments have been focused on this subject in which they have taken a keen interest. This has resulted in the apprentice system on the Grand Trunk Railway standing supreme, not only among railways, but also among the industrial establishments on this continent.

It was early recognized that the most satisfactory method of obtaining mechanics well qualified to prosecute the work of construction and maintenance of railway equipment was to train them ourselves. The demand for first-class mechanics has increased with the development of the railways, and modern railway appliances.

The systematic education and training of apprentices was first started by us in a general way about twenty years ago, and as experience in this line was gained, improvements were made and the system was gradually extended, until at the present time the boys entering the employ of the Grand Trunk Railway as apprentices are given every facility to become proficient in their respective trades.



J. C. GARDEN.
General Superintendent, Motive Power and Car Departments, Montreal.

The vice-president and general manager, W. D. Robb, who himself was an apprentice, as superintendent of motor power, inaugurated the system, and is still very active in its development, and his efforts in this direction are ably supported by the heads of the motive power and car departments.

How System is Organized

The organization for handling the apprenticeship system is as follows:

The general superintendent of motive power and car departments is the officer in general charge of the work, and he decides the policy to be followed. The mechanical and electrical engineer, who reports to the general superintendent of all the detail work, and to him the supervisor of apprentices motive power and car departments, has immediate charge of reports.

The supervisor of apprentices visits all classes regularly and deals with matters of discipline, arrangement for classes, methods of construction and revision of text books. He also attends to the organization of athletics among the apprentices. Leagues are formed among the different stations, both in baseball and hockey, which create a great deal of interest and tend to promote a good feeling among the boys. The company grants free transportation to teams for out-of-town games.

There are six main stations where permanent instructors are employed, who devote their entire time to the work, and there are also three traveling instructors, each having seven stations which are visited regularly each week to give instruction to the apprentices. An apprentice examiner, who examines all apprentices on the system semi-annually, for increases in rate, and who devotes all his time to this work, reports to the supervisor of apprentices.

The annual report of the supervisor of apprentices gives a detailed account of the work done throughout the year, including the examiner's report of examinations at each station.

These results considered as a basis of competition, showing the comparative standing of the different stations. A diploma is given to the station obtaining the highest average.

The applicant for an apprenticeship course must be between the ages of sixteen and twenty-one, and must write a letter of application, which serves as an examination in writing and spelling.

He must also pass a physical examination by the company's doctor and a mathematical examination in the simple rules of arithmetic. Knowledge of elementary mechanics is also helpful.

The following are offered to G. T. R. apprentices:

Motive Power Department	Car Department
Machinists	Freight Car Builders
Boilermakers	Coach Body Builders
Blacksmiths	Carpenters
Patternmakers	Wood Machinists
Moulders	Painters
Electricians	Blacksmiths
Tinsmiths	Machinists
Pipefitters	Cabinet Makers
Toolmakers	Tinsmiths
Air Brake Mechanics	Steam Fitters and Plumbers
Millwrights	Electricians
	Brass Finishers

Shop Instruction

If the applicant is successful in his examination, he is sent to the shop and placed on a simple machine, such as a nut facer, or centring machine, and is looked after by the shop instructor. He remains on this machine until he has mastered its operation, or until the instructor is satisfied that he is qualified to pass on to another machine.

Skilled instructors are employed in each main shop whose

duties are to move the boys from one machine or class of work to another, at the required time, and to follow each move up in order to assist him in his new work, and to keep record of all shifts for future reference.

The instruction in the shop is supplemented by a text book on shop practice, which is supplied without charge to the apprentices on entering the service. This book contains a series of questions and answers applicable to each year of apprenticeship term, and examinations include this work.

It is found that a large number of applicants choose the trade of machinist, and the following shop schedule will give the reader an idea of the opportunities afforded the average apprentice to learn this trade insofar as shop instruction is concerned:

Schedule of Shifts
Machine Shop

Nut facer, centring on screwing machine	3 months
Drills	3 months
Slotter or milling machine	3 months
Boring mills	3 months
Shaper or planer	3 months
Bolt lathes	3 months
General lathes	6 months
Rod bench	3 months
Motion bench	3 months
Air brake	3 months
Erecting Shop	
Eccentrics	2 months
Shoe and wedge and wheels	3 months
Guide bars and steam chests	3 months
Frames and cylinders	3 months
Brakes and spring gear	3 months
Motion	4 months
Trimming	3 months
Front end	3 months
Boiler mountings and superheater equipments	3 months
Total	5 years

Instructions pertaining to the different trades are given in the class rooms to all apprentices. These classes are held during working hours and the apprentices are paid for their time while attending them, receiving instruction for a period of two hours each week. All equipment is supplied by the company gratis, with the exception of drawing instruments, which are purchased in large quantities and sold to apprentices at wholesale prices.

The subjects taught are as follows: Mechanical drawing, sketching, mathematics, practical mechanics and blueprint reading.

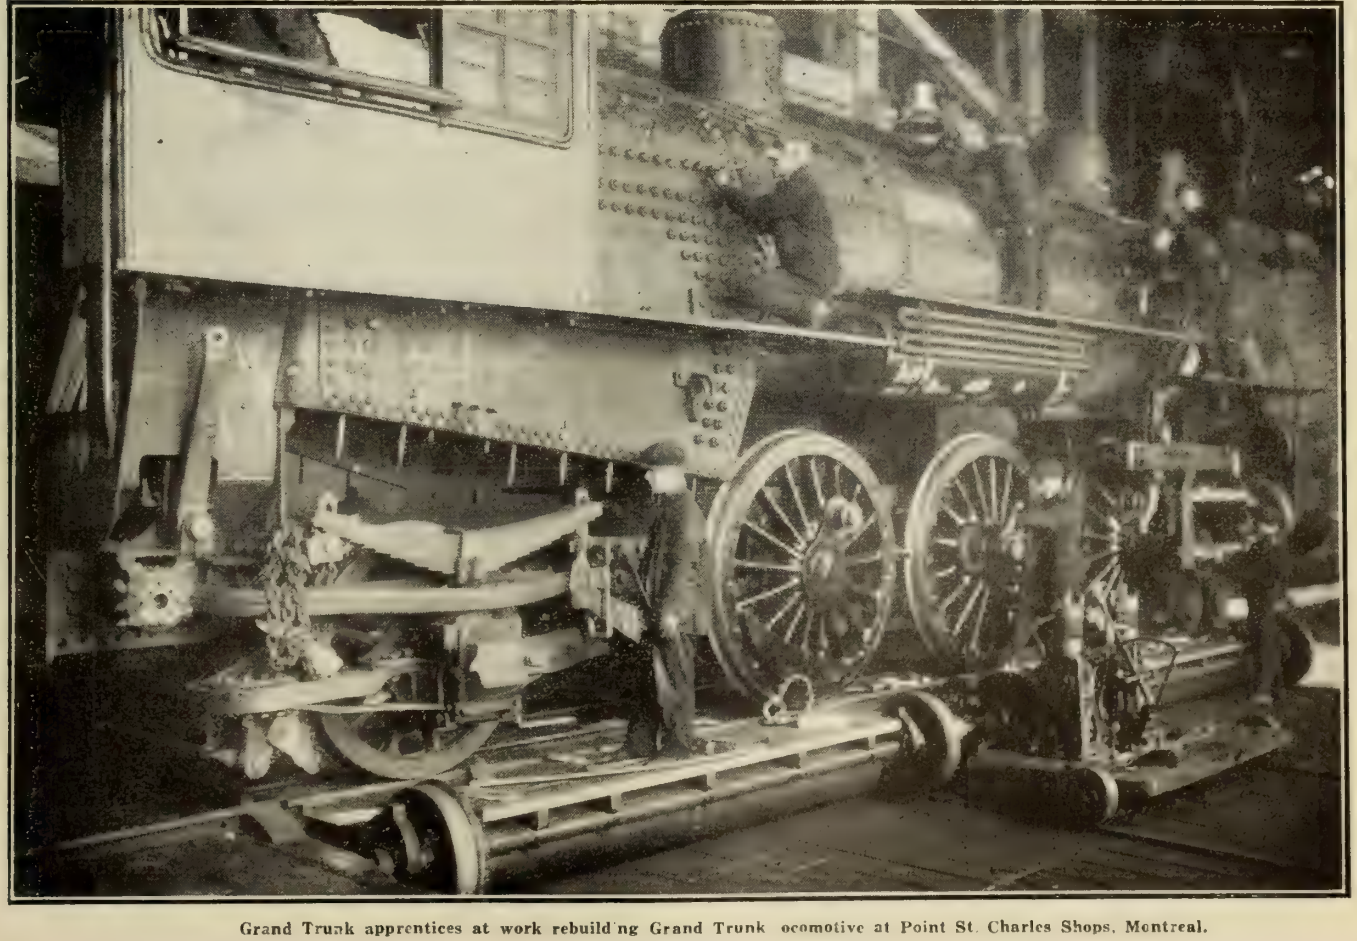
The first year apprentices take up simple mathematical problems. They only touch upon the subject of mechanical drawing, but study the essential subjects leading up to it, such as geometrical constructions, elementary, solid and descriptive geometry to such an extent as to lay a good foundation for future work and give the apprentice practice in the use of drawing instruments.

The second year apprentices take up mechanical drawing and more advanced work in mathematics, geometry and projections. They make freehand sketches of simple models and from these make drawings to scale.

The apprentices in the last three years take up more difficult work in mechanical drawing and mathematics with its allied subjects, specializing more in the details most essential to their respective trades. The making of freehand sketches and drawings to scale are continued, the proper relation of the different views to one another being particularly brought out. The more advanced work in mathematics required in machine design and applied mechanics is here introduced.

To aid the instructors and to make instruction uniform over the whole system, in addition to the text book of questions and answers on shop practice, text books have been prepared in mathematics and drawing.

The mathematical text book is divided into ten sections, each representing a six-months' period of the apprenticeship term. Each apprentice is required to at least reach the successive stages as his term progresses.



Grand Trunk apprentices at work rebuilding Grand Trunk locomotive at Point St. Charles Shops, Montreal.

The drawing book is particularly adapted to motive power and car department apprentices. The course as presented has been carefully prepared. By working out all the problems and doing the exercises in the order given, the apprentice is brought to a stage where he is able to make his own sketches and drawings, read working drawings and understand all blue prints.

Must Pass Examinations

It is necessary for all apprentices at the completion of each six-months' term to pass an examination on the subject taught, before being advanced in rate of pay. These examinations consist of questions relative to shop work, mechanical drawing and mathematics, the marks for shop efficiency being allowed by the foreman. The time allowed for this examination is eight hours and the apprentice must obtain an average of fifty per cent. in each subject, otherwise he must take the examination again in the course of a month.

A feature appreciated by the parents is the quarterly report. These reports are compiled by the instructor, and sent to the parents of the apprentices, showing them the progress the boys are making in the shop and in the class room, also the number of hours absent from work and the wages earned each period. These reports are returnd to the shop superintendent with remarks from the parents.

When the apprentice has satisfactorily completed his course of five years, he is given a certificate of apprenticeship, which shows that he is a qualified mechanic in his particular line.

Apprentices have the privilege of attending the first aid classes which have been developed on the Grand Trunk Railway System. Instructions and demonstrations are given in these classes by competent men and valuable knowledge can be gathered, which is beneficial to anyone in case of emergency.

The apprentices of the Grand Trunk Railway System have for the last number of years taken part in the Mechanical Drawing Competition at the Canadian National Exhibition, and have been very successful in capturing prizes, taking seven out of ten in 1921 and seven out of ten in 1922.

High Standards Maintained

The apprenticeship system of the Grand Trunk Railway System stands as an example of the best that can be offered in systems of its kind, and every effort is made to keep it up to a standard commensurate with the great importance of the work it is doing.

The very satisfactory results obtained by the Grand Trunk and the interest shown by the apprentices are clearly brought to evidence by the fact that the management is seldom obliged to go outside of its own shops to fill a vacancy in the mechanical department, and many of the highest positions in this department are now filled by men who started with the company as apprentices.

MONEY AVAILABLE TO FINANCE

(Continued from page 119)

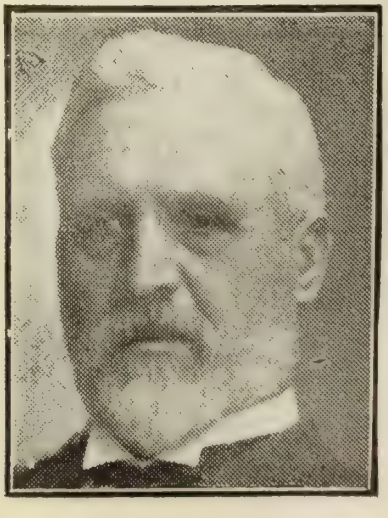
Ever since the United States Steel Corporation advanced the wages for common labor some months ago there have been increases in various trades and industries and in some trades, like building, there has been a shortage which has checked operations. The difficulty in the United States—and the same condition applies to Canada—is that through the immigration regulations the influx of Europeans has been checked to such an extent that industrial labor is at a premium.

The difficulty of this situation is not so much in the actual check to industrial operations through labor shortage but the advances in wages all along the line have a tendency to advance costs, with cumulative effect, and these are passed on to the consumer. The effect on consumption is, therefore, quickly felt and this is particularly the case in Canada because of the large agricultural population and the fact that the slump in the prices for farm products was greater in reducing the purchasing power of the agricultural class than was the decline in the prices for the manufactured products which he has to buy.

The industrial outlook then is for general improvement, the continuation of which will depend largely upon the ability of manufacturers with their labor and taxation problems to keep prices down to a basis where normal consumption on the part of the farmers can be looked for on the basis of profit on agricultural products.

In connection with the periodical revision of the Canadian Bank Act next year there is heard from the agricultural communities the old complaint that the banking system is designed for the benefits of business and industry at the expense of the farmers—in other words that the banks collect deposits in the farming districts and bring them to the cities for the benefit of manufacturers and financiers. There are agitations of a more or less radical nature based on this premise—demands for government banks, etc. Nor is the idea that the banking legislation should be amended confined entirely to the agricultural organizations. There has been a feeling since the Merchants Bank affair that an act which would permit of the conditions revealed in connection with the collapse of that institution is radically weak.

However, the indications are that changes made will be of a constructive rather than a destructive character in view of the record of the banks in their service to the whole country, and that nothing of a revolutionary character will result. One of the weaknesses of the system, however, appears to be the failure of the Canadian Bankers Association to recognize the importance of bringing home to the people what the banks are actually doing in the way of loans to the agricultural districts, in showing that their shareholders are largely people of comparatively small means and many of them farmers and in other ways emphasizing the service rendered to all classes to offset the talk of money trust and other charges that the system is designed to serve the few rather than the many.



HON. JOHN OLIVER

British Columbia's Bright Prospects

By HON. JOHN OLIVER,
Premier of British Columbia.

WITH its vast resources in lumbering, farming, mining and fishing, British Columbia has a substantial basis on which it is building for a prosperous future. Discrimination in freight rates eastward still operates against the lumber industry as against the general development of the Province. In spite of this, the logs scaled during the year exceeded the cut of the preceding year by over 390,000,000 feet. The pulp and paper business is firmly established, and two or three new mills are under consideration.

There was this year a general increase in crop areas, but lower prices are responsible for a drop in total values. Plans for the settlement of some of the best vacant lands of the Province are under consideration. Mining continues satisfactory, in spite of a fall in prices and a reduced market for several metals. In fisheries we lead all other provinces, two-fifths of the whole Canadian output being caught in our waters, and this in spite of a falling off in the salmon cannery pack. The Provincial credit stands high in the money markets, and the prospects for the coming year are altogether brighter than for some years past.

Employment Statistics Show Industrial Growth

Peak in 1922 Highest Since Middle of 1920—Great Increase in Building Permits Charts Shows Motor Industry Well Employed—Imports Down But Exports Advance—Wages Slightly Lower

By RONALD HOOPER,
Associate Editor, "Labor Gazette," Ottawa.

WHILE THE readers of Canadian Machinery are, naturally, more or less interested in certain specific industries, it is at the same time desirable that a background should first be obtained of employment conditions in all the basic and manufacturing industries of the country taken as a whole. In January, 1920, the newly-created Employment Service of Canada commenced the work of receiving and tabulating each month the employment returns of some 6,000 of the most representative industrial concerns in the country.

A reading of the index numbers, which are based on the number of employees actually at work on the last day of each month, taking the index of January, 1920, at 100, shows that the highest peak, slightly higher than 109, was reached in July, 1920. In October there developed a declining movement which by January, 1921, had reached 88. There were fluctuations up and down during 1921, until January, 1922, the lowest peak in three years was recorded at 78. The tendency, however, showed signs of improvement and in April, from a point around 81, there was a pronounced upward swing to 96 in October. Cessation of seasonal work has since brought about a slight decline.

Better Showing in Skilled Labor

It is of interest to note that returns received from trade unions show the same trends in employment as the reports from employers. A careful analysis of the trade union figures indicates, in fact, a high degree of correlation between the two employment curves, although as the trade unions are for the most part composed of skilled workers, they do not report such marked fluctuations as are indicated in the employers' returns which cover not only skilled workers but unskilled as well. Reports from 1,468 labor organizations with a total membership of 153,642 persons on October 31 last, showed 147,438 members employed, or 96 per cent. The reports from trade unions showed on October 31, 1920, an employment percentage of 93.9. According to this index, therefore, the early winter situation shows a volume of employment among organized and, for the most part, skilled workers appreciably greater than last year.

The accompanying tabulation gives for each month from January to October of the present year the index numbers of employment as reported by employers in certain basic and manufacturing industries in which readers of this journal are perhaps more intimately concerned. In order that the table shall be of greater interest, some of the industries are further divided into groups.

A column has been introduced into the table to show the average relative weight of employment in each industry, or branch of industry, in comparison with all the industries in the Dominion. For instance, the average relative weight of the manufacturing of iron and steel products industry is given as 15. This means, of course, that out of every 100 workers reported by the industries making returns as being employed in any given month, about 15 were employed in that particular group.

For the benefit of those readers who might be specially interested in the automobile manufacturing industry, it should be stated that this industry is included with railway rolling

INDEX NUMBERS OF EMPLOYMENT AS REPORTED BY EMPLOYERS MAKING RETURNS

INDUSTRY—	Average Relative Weight	Index No. Jan., 1920 = 100	1922									
			Jan. 31	Feb. 28	Mar. 31	Apr. 30	May 31	June 30	July 31	Aug. 31	Sept. 30	Oct. 31
Manufacturing iron and steel products:	15.0	100	55.4	68.5	64.9	62.5	70.5	65.6	70.8	72.3	72.1	74.3
Crude, rolled and forged products	1.6	100	53.7	50.7	49.6	49.5	51.4	57.7	64.8	60.9	60.4	56.1
Machinery other than vehicles	1.0	100	58.5	60.4	60.8	62.8	46.4	63.1	62.9	64.3	63.6	65.2
Agricultural implements	.7	100	49.3	53.3	54.2	48.6	49.0	56.0	56.2	53.1	53.3	54.2
Land vehicles (Motor Cars)	7.1	100	58.4	90.4	78.8	72.8	89.2	72.3	84.1	87.3	86.1	90.9
Steel shipbuilding and repairing	.4	100	17.3	21.5	——	——	41.6	28.2	21.9	23.8	22.1	23.2
Heating appliances	.7	100	73.7	80.0	81.1	82.8	85.1	86.8	85.4	86.5	89.0	93.9
Iron and steel fabrication (n.e.s.)	.7	100	68.9	68.2	67.0	67.4	73.4	74.0	74.4	84.6	88.1	89.2
Foundry and machine shop products	.6	100	61.7	65.0	65.8	68.8	69.7	68.6	69.2	73.0	73.4	72.0
Others	2.2	100	——	47.6	49.1	50.8	68.9	69.9	71.3	71.7	73.4	75.3
Manufacturing non-ferrous metal products:	1.4	100	60.8	62.5	64.8	65.1	67.7	71.4	72.7	78.5	74.8	77.1
Manufacturing mineral products:	1.2	100	85.9	85.0	87.3	94.9	96.7	97.4	96.7	94.4	97.3	96.0
Manufacturing lumber and its products:	6.8	100	68.6	70.8	76.2	88.9	107.0	113.3	116.6	114.8	108.3	100.5
Rough and dressed lumber	4.7	100	67.6	69.0	77.0	98.1	130.0	139.3	144.1	142.0	129.1	114.2
Lumber products	2.1	100	——	——	75.3	77.1	77.9	78.5	80.1	78.9	80.2	81.9

All other industries:	57.0	100										
Total all industries:	100.0	100	78.9	81.9	80.6	83.3	89.2	91.1	93.1	93.7	94.6	95.8

stock, etc., in the Land Vehicles group. Separating the automobile manufacturing industry from the rest of the group its relative weight is found to be about one-sixth of the group, or about 1.2 per cent. of all the industries. Index numbers of employment in the industry for certain months of 1922 are approximately as follows:

Date	Index Number
January, 1920 (base)	100.0
January 31, 1922	81.3
September 30, 1922	63.0 (temporary shutdowns)
October 31, 1922	90.4

It is not possible at the present time to give the actual number of workers in 1922, but nevertheless a fairly close estimate can be made from the index numbers, the actual number of workers engaged in the manufacture of automobiles in January, 1920, being 7,627. Of this number 7,374 were males and 253 were females.

Building Permits a Barometer

The accompanying chart shows the values of building permits issued monthly by 35 municipalities from January, 1915, to October of the present year, as reported to the Department of Labor. The values of such permits issued in 1920 and 1921 amounted to about $100,680,000 and $94,508,000 respectively. During the present year there has been a noticeable improvement in the employment of building tradesmen as compared with 1921. This coincides with the permits issued, the value for the first ten months of the year being $105,501,000.

Import and Export Values

The following tabulation taken from a recent bulletin of the Department of Customs and Excise, which shows for the first seven months of the past and present fiscal years the values of imports and exports in certain selected industries, will be of some interest as another indication of the improvement in industrial activity:

	Imports		Exports	
	7 months ending Oct., 1921	7 months ending Oct., 1922	7 months ending Oct., 1921	7 months ending Oct., 1922
Iron and its products	$ 68,860,923	$ 79,552,197	$ 15,907,847	$ 25,778,093
Non-ferrous metals and products	16,880,141	20,755,891	15,009,795	21,860,815
Non-metallic minerals and products	84,746,795	63,796,703	14,670,461	15,076,269
Wood, wood products and paper	21,048,733	20,357,481	102,192,194	128,999,212
Chemicals & allied pr'd'cts	13,409,420	14,699,168	5,568,541	7,353,238
	$204,946,012	$199,161,390	$153,348,838	$199,067,627

The Department of Labor has issued bulletins on wages in certain industries in Canada, Bulletin No. 1 covering the period 1901 to 1920, and Bulletin No. 4, the years 1921 and 1922. The changes are analyzed in the form of index numbers for which wage rates in 1913 were taken as base and therefore made equal to 100.

In the following tabulation the wage index numbers for the years 1914 to 1919 have been omitted as wages rose steadily during those years, reaching the peak in 1920.

Index Numbers of Wage Rates

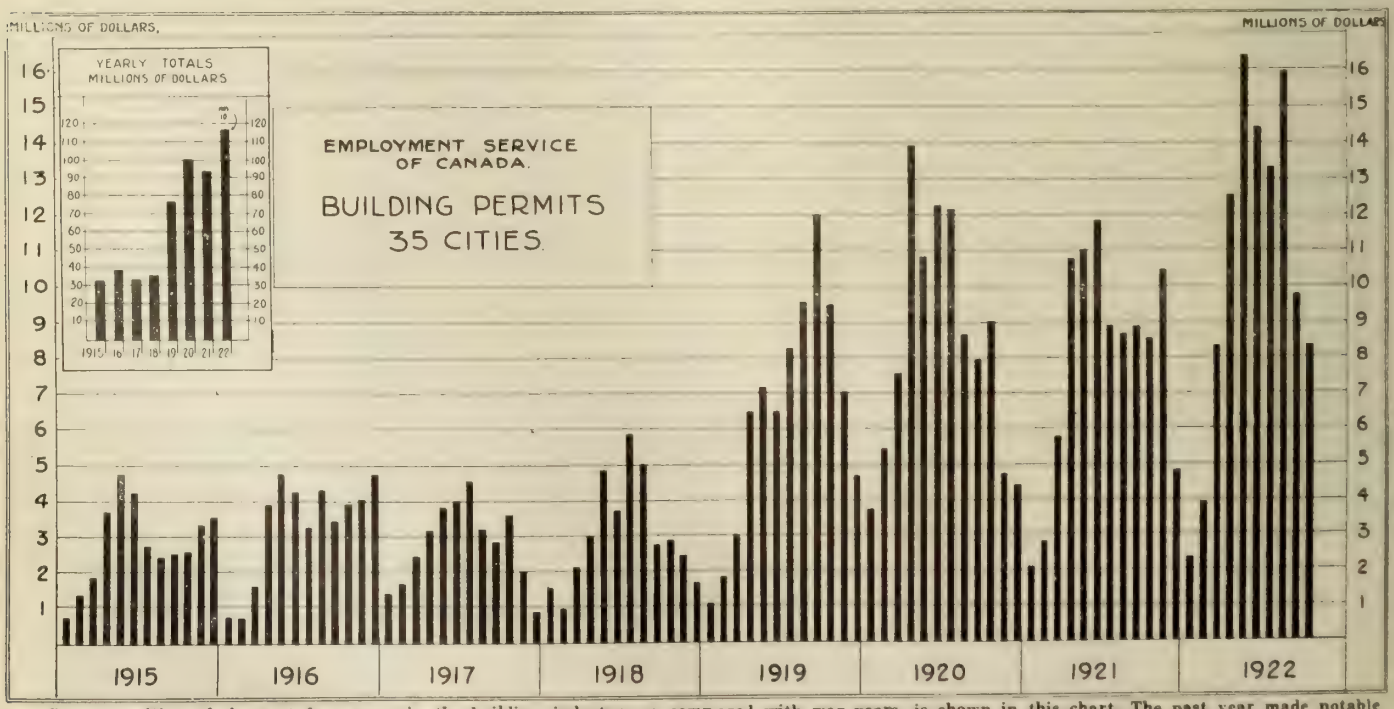
	Building Trades	Metal Trades	Steam Railways	Coal Mining	Lumbering
1913	100.0	100.0	100.0	100.0	100.0
1920	180.9	209.4	186.6	197.7	202.7
1921	170.5	186.8	165.3	208.3	152.6
1922	162.5	173.7	155.1	197.8	146.7
Decrease in 1922 from 1921	4.7%	7.0%	6.2%	5.1%	4.9%

The wage decrease on steam railways is tentative, subject to adjustment.

In the building trades the wage rate decreases in 1921 and again in 1922 averaged about 5 per cent., but in the metal trades the decreases in 1921 averaged about 10 per cent. and about 7 per cent. in 1922. In steam railways there was a general decrease averaging about 10 per cent. in 1921, but in 1922 the rates for men engaged in operating trains were not changed, but wages in the shops, maintenance of way and clerical forces were reduced approximately 10 per cent., so that in 1922 the average change in the wages of all classes of railway employees was only about 6 per cent. In coal mining, wages were reduced in Nova Scotia between 25 per cent. and 30 per cent. in January, but were later advanced to a level approximately 10 per cent. below the 1921 level, and in Vancouver Island the reduction from September, 1921, to September, 1922, was about 5 per cent. In Alberta and South-east British Columbia a wage decrease proposed in the spring was prevented by a strike. The average decrease in the three areas was, therefore, about 5 per cent. In the lumbering industry there was a considerable decrease in wage rates in 1921, particularly in British Columbia, but in 1922 the decrease averaged only about 5 per cent.

In metal mining no statistics have been published, but reports have appeared in the press on numerous decreases in wages in British Columbia as well as in Northern Ontario, the

(Continued on Page 54)



Strong position of the past four years in the building industry, as compared with war years, is shown in this chart. The past year made notable records in May and August. Summary (inset) shows the year 1922 to have been the best since 1915.

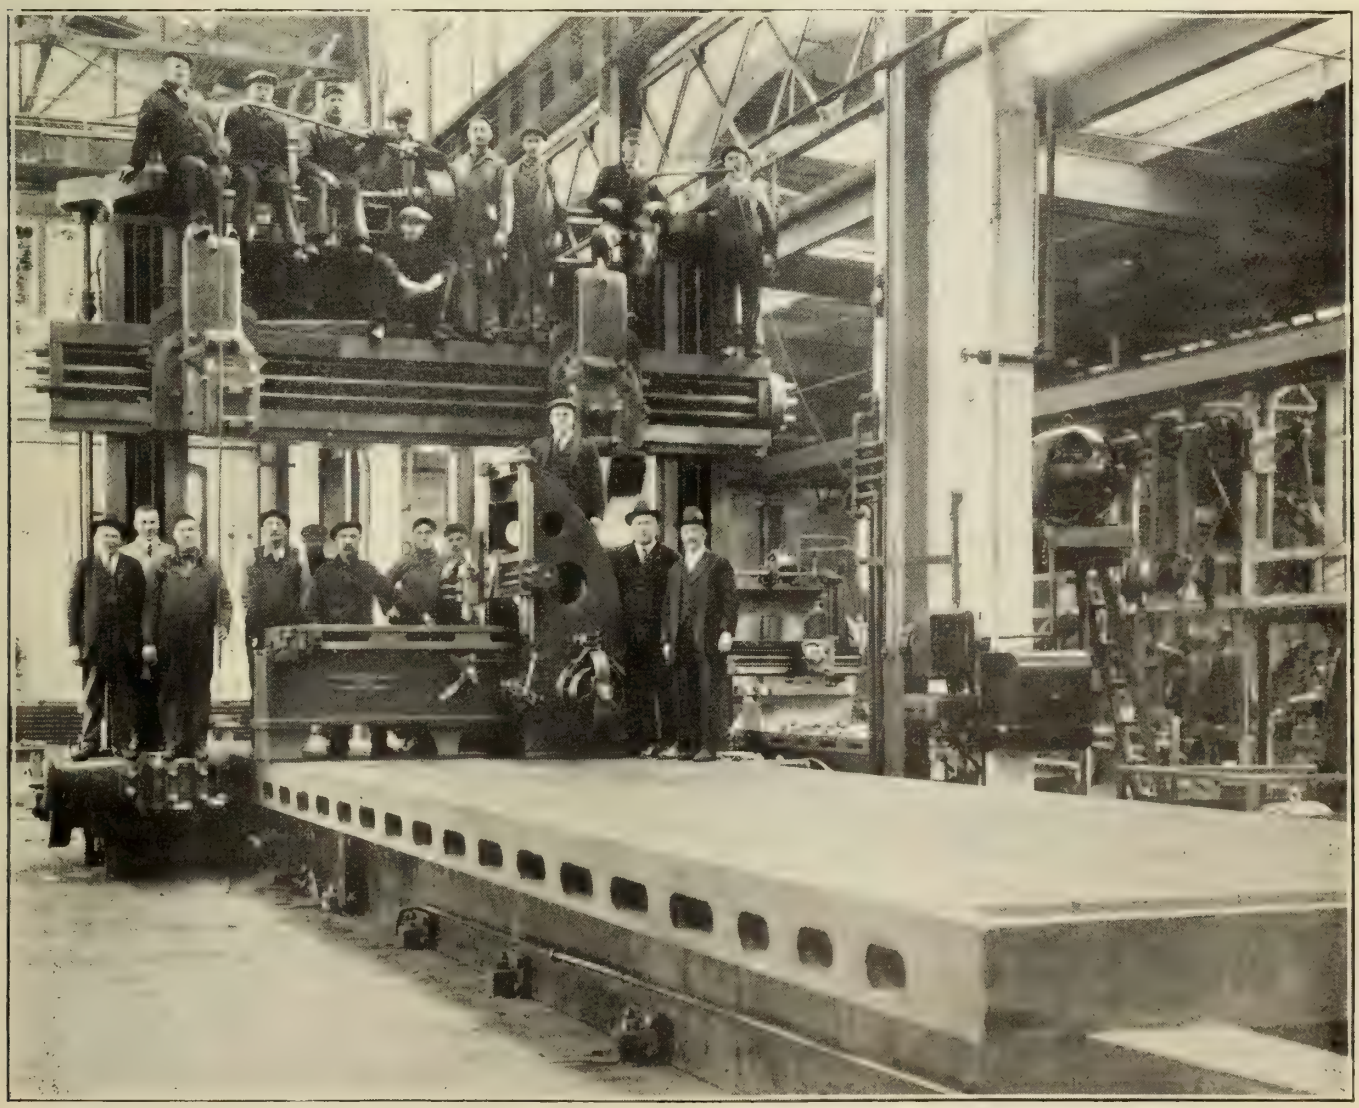
Large Planer Constructed by Canadian Firm

Design Provides Extreme Rigidity Under Heaviest Cuts—Special Lubricating System—Table Fitted With Side Guides—Drive Gears Generated on Maag System—Forged Steel Table Rack

INCREASING demand for large and heavy duty machine tools, as well as various classes of engineering equipment, has necessitated the designing and constructing of tools capable of machining the large frames and foundation castings usually associated with massive machinery. To take care of this growing tendency for heavy production work, the John Bertram and Sons Co., of Dundas, have recently completed and installed in their own plant the large planer here shown and described. The machine has a capacity for planing work 45 ft. in length at one setting. When cross rail is at its maximum height the space is 10 ft. 2 1-2 in. high and 12 ft. 2 in. between the uprights. The bed is a heavy box section with a wide body made especially deep around the gear space. There is one "V" and one flat track. The bed has a solid web across the top in addition to closely spaced cross ties, as a safe-guard against accident and to provide rigidity for heavy cuts. It is reinforced by double walls surrounding gear space and the entire centre part of bed, including double walls, extends below floor line. Gear shafts are supported by the four vertical walls, and shaft holes bored to jig. Table tracks are washed and lubricated by a continuous stream of oil under pressure from a geared motor driven pump. Oil is collected in settling tanks, strained and used again.

The table is a heavy box section with three finished T-slots and a suitable number of 1 1-2 in. reamed pin holes. Bottom of table is solid with no openings, thus preventing chips or cutting fluid from reaching the gears or tracks. Table is provided with side guides to prevent its crowding sidewise under heavy side cuts. Tracks are planed and scraped to fit tracks of bed. Controlling levers are placed on each side of machine and oscillate in a vertical plane. Table has cored holes in the side for the removal of chips and a trough cast at each end for catching chips or cutting fluid.

The driving gears are steel castings and pinions are forged steel with wide faces and heavy pitches, proportioned to safely transmit heavy working loads without undue wear. Teeth are gener-



Large 144-in. planer recently erected by and installed in the plant of the John Bertram & Sons Co., Dundas, Ont.

ated on the Maag system, producing the smoothest action. Table rack is steel forging, and each section is securely doweled and bolted to table; face is washed by continuous streams of oil, under pressure, from the same pump, which lubricated table tracks. The housings are of heavy box section having a long bearing on the bed, are securely bolted and pinned and are connected at the top by a deep arch. Housings have wide face.

The crossrail is a heavy box section carefully scraped by hand to fit the uprights and is securely clamped to both inside and outside edges of same. It has a wide face and is long enough to permit one head to plane the entire width between housings without interference from the other head. The crossrail is raised and lowered by a 15 h.p. motor. The rail heads have a long bearing and narrow guides on the crossrail are compound and provided with graduated swivels and taper gibs throughout to take up the wear. They have cross, down and angular automatic variable feed in all directions, at either end of the cut. The horizontal feed varies from 1/32 to 1 in. and the angular or down feed varies from .008 in. to ¼ in. The slides have a vertical or angular travel of 32 ins. The tool aprons are furnished with four bolts and two straps, with a tool opening 5 in. x 5½ ins. Heads are provided with automatic tool lifters without cord or pulley. The tool slide feed screws may be operated from either end of the crossrail by hand and have graduated collars.

The slide heads are compound and are provided with graduated swivels and taper gibs throughout to take up wear. They have automatic vertical feed in either direction, from below the table to the highest position of the crossrail, and are adjustable independently of the crossrail. The tool slides have a horizontal or angular travel of 24 in., are provided with hand adjustment by ratchet wrench traveling with the heads. The tool aprons have an opening for tools 5¼ in. x 5½ in., and are seated by self-releasing spring plungers. The feed screws have graduated collars.

Reversing Motor Drive

The Niles-Bement-Pond reversing drive consists of a D.C. reversing motor direct connected to the planer in the usual way, and a motor-generator which supplies current to the motor. The complex automatic controller, which forms part of every other reversing motor drive, is dispensed with except for a field rheostat and a rugged, durable master switch. This drive is not confined to a power supply of direct current, but is also furnished for alternating current, being the only equipment made on this side which can be so used. It is now possible to buy power from a central station furnishing only alternating current and use reversing motor driven planers. In shops provided with both A.C. and D.C., the D. C. supply is very apt to be overloaded. In such cases this drive may be put in without adding to the D.C. capacity. Reversal of the table is accomplished by reversing the motor by means of a patent automatic controller, actuated automatically by dogs on the side of the table or by hand from either side in the same manner as a belt driven planer.

Fourteen cutting speed from 25 ft. to 50 ft. per minute and four return speeds from 60 ft. to 100 ft. per minute may be obtained. Each is independent of the other and may be varied while the planer is running. A pendant switch is furnished by means of which the operator may take full control of the planer or stop it instantly without leaving his position on or alongside the table. The pendant switch is also used to lock the table so that it cannot be moved accidentally. An overload and no-voltage circuit breaker protects the motor, and in case of overload or failure of voltage applies a powerful emergency brake, absolutely preventing it from running away. Circuit breaker resistance and controller are contained in a ventilated metal case and wired together, nothing being left for the customer to do except reconnect the wires leading to the controller case, which we have to disconnect when shipping the machine. These wires are numbered and are connected to a convenient terminal block, having corresponding numbers and carried in conduits to the driving motor, elevating motor and pendant switch. The contacts on the controller are copper and carbon and accessible for quick cleaning if needed. Arcing is prevented by automatic relays and powerful blow-out coils. All wires and terminals in the controllers are properly marked and wiring diagrams and instructions are furnished. Total weight of machine in working order, 380,000 lbs.

15,000 TONS OF MATERIAL

(Continued from page 125)

south side, second floor of the building.

Comprising three sections, the plant, it will be seen, is nevertheless, self-contained and well served. Each department may be said to operate a separate unit, toward general production and ultimate shipment. Heavy equipment is all located on the ground floor. There is no overlapping, such as might occur on a single floor arrangement. The working force ranges from 200 to 300 men. The yearly average of manufactured output is about $2,500,000.

Combination Die for Muffler

As an example of some of the dies that are used in the Pedlar shop in the making of automobile parts the two here shown are briefly described. One of these is the combination blanking, cupping and piercing die for the cap of the hot stove on the Chevrolet muffler. The cutting ring A, which is fitted in the die bed B is made with exceptional shear on the cutting edge so as to relieve the pressure when shearing the metal. The die ring A is held firmly to its seat by means of equally spaced screws C. Concentric with the cutting ring and fitted lower down in the die bed, is the bush D, held in place by means of screws EE. This bushing carries on its upper end the piercing die F. The pressure ring G is fitted to slide freely in the space between the inner and outer dies, and restricted to an upward movement by the shoulder bearing on the base of the outer cutting ring. The pressure pins H extend through the die bed to a plate connected to springs or other means of required pressure.

The punch plate I, which is bolted to the ram of the press, carries the punch ring J, the outer edge of which is the cutting portion, while the inner circumference acts as the sizing portion for the drawn muffler. The screws K secure the punch ring to the upper bolster. The central retaining ring L carries the piercing punch M which is locked in position by the dowel shown. The knockout ring N is fitted in position before the dowell is finally inserted. The push pins O are connected to the plate P which is automatically operated when the ram rises to its upper position. The outside stripper ring Q is fitted to the ring R, the latter being connected to the blank holder ram by means of the pins S. These dies are operated on the subpress principle, the guide pins T entering into brushed holes in the upper bosses V.

Closing Nose of Fenders

An interesting die is that used for closing the nose of the front and rear fenders on the Chevrolet 49 car. On this die the block A is operated by a system of levers to move the blocks B outward to support the inner side of the stock while the forming pieces C are forced in radially by the action of the wedge blocks D, which are secured to the face of the bolster E, fitted to the ram of the press. The sliding pieces C are returned to their outward position by means of springs pressing against the lugs I. This die is also operated on the sub-press principle.

A considerable export business has always been done by the Pedlar People. Notable at the present time are the fairly large shipments to Japan and also to South America, in expanded metal lath, and other building material. The recent fire in the north country also created a heavy demand for metal culverts. It was noted that, while steel and concrete used in culverts withstood flames, wood very rapidly burnt out, and this, helping to make the roads impassable, impeded the escape of the fleeing settlers with their belongings.

Officers of the Pedlar People, Ltd., at the present time are: president and manager, W. R. Geikie; vice-president, in charge of Montreal branch, W. E. Ramsey. These with F. L. Mason and W. H. Hall, form the board of directors. W. E. Clarke is sales manager, and E. B. Northwood is in charge of the Toronto branch.

Getting An Accurate Line on the Year

IN THIS number will be found an interpretation of Canadian industrial development that may be regarded as absolutely dependable. Moreover, it portrays the extent and importance of the steel and iron industry. Reports as to the year's operations are from reliable sources. Statistics are, for the most part, based upon Government returns. As reflecting the close association existing between steel and other materials used in working out the industrial destiny of the country, the articles herein contain much that will be of interest to manufacturers and business men as a whole.

Through them all is a note of confidence and optimism. Records during the past year have been excelled in recent years but much that was vague twelve months ago has been made clear and there is daylight where formerly there was discouraging doubt.

* * * * * * *

FROM manufacturers, bankers, municipalities and government authorities there comes an expression that is inspiring in its enthusiasm. Contagion of this kind is good. Industry is ready for better things. It was demonstrated during the year that much improvement came from the conviction that business favors those who expose themselves most persistently to it. Where this fact is generally observed, industry is sure to acquire strength.

* * * * * * *

PROBABLY the most noticeable index of the past year was the return of the Canadian dollar to par, and the steady approach of the pound sterling to its pre-war value. Many disadvantages attended exchange problems. While it did curb senseless buying, it also handicapped enterprising expansion. Undoubtedly, it was a factor in decisions looking to the location of branch American factories in Canada. The present status of the pound and the dollar indicates that relative inequalities are being dispelled. Greater confidence in international affairs should result.

* * * * * * *

A VERY considerable increase in export trade will surely develop during the coming year. It is notable that the past three months have made good gains over those of last year, October being more than $22,000,000 ahead, while for the seven months of the year ending October, the gain in exports was about $75,000,000. Better terms in trade treaties with Australia and France have recently been secured and no doubt the year will produce more advantageous facilities with other countries. The pulp and paper, lumbering and motor industries have shown increasing export strength during 1922 and will make higher records in 1923.

AS TO THE financial outlook, it is pointed out that the investment of capital in securities—bonds and stocks—is an important factor in the development of industry. Here, again, confidence is shown in the country's future from the manufacturing standpoint, on the part of Canadian investors and also on the part of investors in the United States who have been putting large sums into Canadian enterprises and Canadian branches of American concerns.

* * * * * * *

THERE IS one outstanding problem. All interests are agreed that it is imperative. There must be high-standard immigration. The country must have population if industry is to have adequate domestic market giving scope to production. Within easy reach of railroads with which the country is at present over-equipped, there are large areas of land which represent opportunity for the industrious agriculturalist. It is further predicted that the coming spring will open with a swing that is sure to find a shortage of labor, and of skilled mechanics in certain lines. The available supply was fairly well exhausted during the summer months of 1922. Large numbers of men also went to the United States and were absorbed in the industrial boom. There is going to be a demand for help that is willing and worth the money. Immigration must co-operate in meeting the need.

* * * * * * *

AN EXAMPLE of vision as to the industrial future of the country is given in the operations of the Canadian Steel Corporation at Ojibway. Here seven million dollars have been expended already in the preliminary work of establishing an immense industry with townsite in connection. No statement is available as to the time of active operation or at what point in the development furnaces may be blown in and wheels set in motion. It is a matter of preparedness. There are other enterprises afoot which indicate confidence in the country's future. Some have to do with the steel industry; others with pulp and paper and lumbering; but all indicate vision and confidence. These are great requisites.

* * * * * * *

THERE is an old saying that the town of Happiness is in the State of Mind. The state of mind, with high courage and cheerfulness, confronts the problems of another year. Co-operation and confidence will have much to do with the solution of the problems. The prospect is not without definite promise, and the message that Canadian Machinery and Manufacturing News gives to Canadian industry as a whole is that a full measure of prosperity and happiness may be the year's fruition. May operations "in the red," and activities "in the blue," give place to records reflecting gratifying results.

Decks Cleared for Better Year in Steel Industry

Much Liquidation in First Half of 1922—Second Half Showed Decided Improvement in Demand—Market Now on Sound Basis —Output of Foundry Iron Doubled in November

COAL STRIKE PROSPECT AS MARKET INFLUENCE

PRODUCTION of steel ingots in the United States in 1922 was about 34,000,000 gross tons, against 19,000,000 tons in 1921 and 41,000,000 tons in 1920. From 1920 to 1921, consumption of steel certainly did not decrease by 53 per cent. as did production. In 1921 there was liquidation not only of stocks of steel in the hands of buyers, but also of manufacturers of steel, including machinery, implements and hardware.

It was this process of liquidation which practically divided the past year into two distinct parts, from the viewpoint of the Canadian steel market. The first six months, dealers declare, was a distinct loss. Stocks, representing periods of higher value, were liquidated in order that business might be placed upon a sound, stable basis. The second half of the year has shown marked improvement and the outlook is free of the perplexing problems of readjustment that were held over from 1921. The decks are cleared for more definite and, it is to be hoped, more profitable operation.

Showing a decline of seven per cent., as compared with October, the output of Canadian pig iron during November was 34,289 long tons, while in October it was 36,888. November production, however, was 8.8 per cent. higher than the preceding ten-month average. The year's output declined 37.4 per cent. below 1921, or a total of 207,271. In the output of basic pig iron, for conversion into finished steel products, Canadian furnaces declined from 28,922 tons in October to 26,156 in November, while the output of foundry pig iron increased to almost double the October record, or 8,133 tons. This indicates improvement in foundry operations. Although Steel Co. of Canada are about to blow in a second furnace, there were only four Canadian furnaces in blast in November —two at Sydney, one at Hamilton, and one at Sault Ste. Marie.

In United States, as in Canada the coal strike was probably the dominant factor in iron and steel trade conditions during the year. In Canada it was responsible for an increase in price of pig iron by about $10 a ton. This has gradually declined, and the year closes with a price of $31.80 for 2.25 to 2.75 per cent. silicon. The coal strike, according to our Pittsburgh correspondent, probably helped to stimulate demand, but it left the industry with higher costs and the consumers with higher buying prices.

Prospects for 1923 would be fairly clear were it not for the chances of there being more trouble. No one, probably, is in position to assert that there is any strong balance of probability either that there will be or will not be another coal strike April 1, 1923, and uncertainties in that respect may be the chief influence upon prices and demand in the first three months of the new year.

Were it not for this coal factor, it would seem entirely safe to predict, on the basis of present well-known facts that there will be heavy production and consumption of steel during about six months of the new year, probably with a tapering off afterwards, with steel prices well maintained for several months, with softening perhaps in a few products, and then a gradual decline. There has been a secondary inflation in 1922, not enough to prevent active business, but such as to make it necessary that eventually the general post-war deflation must be resumed. There will be many ups and downs in prices, for years to come, just as there were after the Napoleonic wars and the Civil War of the United States.

Toronto

Dec. 28

IRON and steel markets approach the New Year in much better position and with greatly improved prospects than in December, 1921. At that time the movement was under way to liquidate heavy stocks that represented abnormal prices. Considerable writing-off was done, and it may be said that the dealer, during the first six months of the present year, had to do with discouraging conditions. The second half saw gradual improvement and by December had made such progress as to give the year a more normal aspect. Volume, in fact, has been larger than last year, and in spite of slightly higher prices in 1921, say one cent per pound, financial comparison is also gratifying.

Machine tools have not had the best kind of year. Demand has been noticeably shy of any large buying, and while woodworking equipment has become stronger owing to activity in various branches of the lumber business, metal working machinery has had an erratic course. However it may be said that all industry is on a more stable footing to-day than it was one year ago, and has a better grasp of conditions because the latter have become more definite. Machine shop and mill supplies have shown a fair demand. Mining, pulp and paper, and building industries have enjoyed considerable expansion, and in that connection large engineering works have called for requirements that have meant good business in the iron and steel and machinery business.

Iron and Steel.—Year-end business, while generally showing an unwillingness to increase inventories, has been fairly active or sufficiently so to encourage the hope that the year 1923 is going to get away to a fairly good start. In fact, the Toronto office of the U. S. Steel Corporation reports that not only was the year better by 100 per cent. than the year preceding, but that 1922 is closing with fair placing business for first quarter. In fact, something like 2,000 tons were placed second week in December. The basic price has been advanced to $1.90 and steel men predict that the year will not have gone very far before the market shows a decided inclination to swing upward. Labor is high, transportation is expansive as it is difficult, and it is notorious that the steel industry claims to have been operating "in red," or at a loss during the past year. Heavy liquidation marked the close of 1921 and beginning of 1922, but the year developed strength with the opening of building operations and activity in the motor car industry.

What fluctuation occurred in sheets and bars was largely due to the coal and rail strikes. Bars were quoted at $2.75 early in the year, but by June had advanced to $3.00. By September the price was $3.25 and gradually stabilized at a range of $3.25 to $3.40. Galvanized sheets also indicated an advance from $5.35 to $6.25 in eight months and prices remain quite firm with the close of the year.

Dealers are agreed that 1923 will see a great improvement in railway buying and that conditions generally should more faithfully reflect the so-called boom in the United States.

Current Toronto prices:

Iron bars	3 25	3 40
Steel bars	3 25	3 40
Reinforcing bars	3 15	3 25
Steel hoops		4 75
Tire Steel		3 50
Spring steel	7 00	14 00
Band steel, No. 10 gauge and 3-16 in base		3 90
Small shapes		3 50
Sheets, black, No. 28		4 60
Sheets, blue, ann., No. 10		4 26
Canada plates, dull, 52 sheets		4 90
Canada plates, all bright		5 40
Galvanized Sheets, No. 28		6 00

Old Materials.—While the year closes with no pronounced movement in scrap metals, conditions seem to have improved, what with greater activity in blast furnaces and better business with the foundries. Large Toronto dealers, while declaring that the market is with-

out local features, point to the improved strength in American markets as being the basic consideration. Pittsburgh reports that expectation of higher prices has caused a display of "pep" in a market that, for some time, has appeared dormant. Those who have material are inclined to hold for higher figures, and no great volumes are coming forward. Copper and brass, in sympathy with the basic market, are very firm. Lead has also firmed. Dealers' average buying prices:

Copper, light	9 00
Copper, crucible	11 25
Copper, heavy	11 00
Copper wire	11 00
No. 1 composition	9 00
New brass cuttings	7 00
Red brass turnings	7 00
Yellow brass turnings	5 25
Light brass	4 50
Medium brass	6 00
Scrap zinc	3 50
Heavy lead	4 50
Tea lead	3 00
Aluminum	11 00
Boiler plate, per gross ton.	9 00
Heavy melting steel	10 00
Axles (wrought iron)	20 00
Rails (scrap)	11 00
Malleable	10 00
No. 1 machine cast iron	18 00
Pipe, wrought	7 00

Non-ferrous Metals.—This department is closing the year with a flourish. While there is no change of note in local quotations, things are happening at the base of supply. A few weeks ago copper seemed to have reached a high at $14. Large orders for export and domestic trade, coupled with a decidedly bullish sentiment, seems likely to skyrocket copper to a point above $15. Demand has shown some spirit and producers are predicting a shortage that restricts them to delivery three months hence. Referring to the movement of lake copper, it is learned that, in spite of the close of navigation, this continues heavy. The Calumet alone moved more than 2,500,000 pounds this month, with the bulk consigned to France.

Although tin has fluctuated considerably due to speculation and exchange movements in London, it is expected that there will be higher prices after the New Year.

Lead has taken its place among the strong features. Recently the American Smelting and Refining Company advanced its price $3.00 a ton to a basis of $7.25, New York. One reason given for the somewhat unexpected advance is the improved statistical position of the metal. Stocks were estimated at 100,000 tons at the first of the year; practically all of this has been consumed. In spite of a tariff duty of 2.12½ cents a pound, as against a previous duty of 25 per cent. ad valorem, about 66 per cent. of the Mexican production is being brought into the U. S. for consumption and the balance is being shipped to Europe.

So far as finished products of copper and brass are concerned, manufacturers state that, should strength continue, an advance in prices may be looked for early in the New Year. Local prices:

Lake copper	17 25
Electrolytic copper	17 00
Castings, Copper	16 50
Tin	41 00
Lead	7 50
Spelter	9 50
Antimony	8 50
Aluminum	22 00

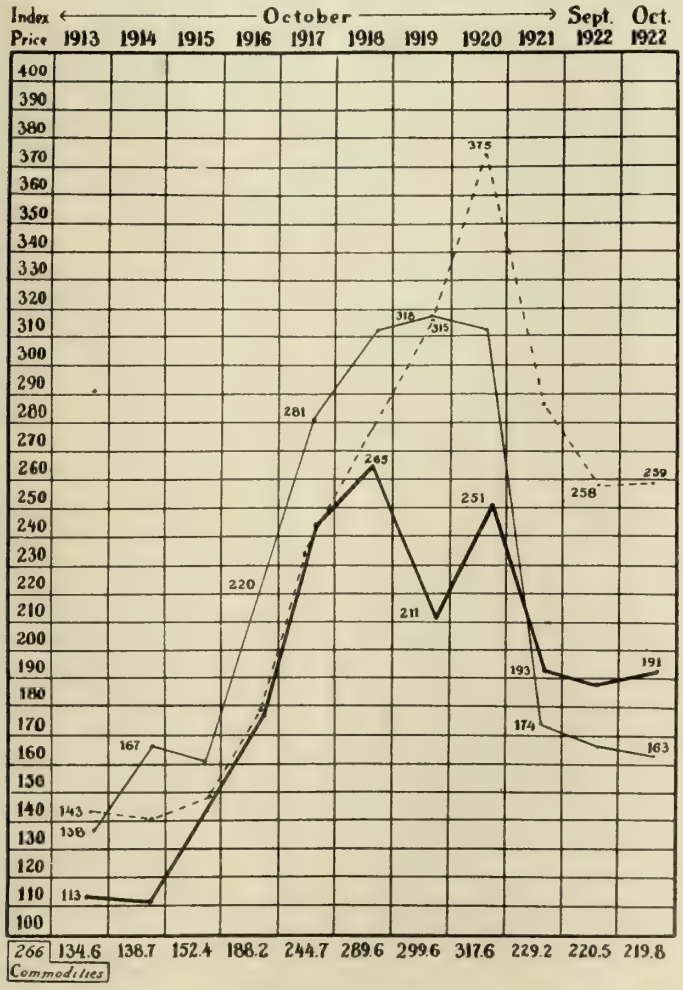
Machine Tools.—Observers report that the past year has not been marked by any conspicuous buying for or on the part of large concerns, apart from what is regarded as engineering demand. Some business has developed in connection with small shops, but this has largely called for used equipment, of which there is considerable in the market even after two years of steady absorption. Woodworking machinery improved during the year and it is an encouraging fact that machinery of all kinds will have a better opportunity now that industry generally is on a more stable basis and can view the future with greater confidence.

In his review of the machine tool industry, E. F. DuBrul, manager of the National Machine Tool Builders' Association, has this to say of demand:

"All sorts of curves in bank bulletins and economic services show an improvement in business, but the trend is quite less marked in pig iron, coal and copper, than in petroleum, cement, sugar, wheat flour, cotton, tobacco, and paper, as shown in the monthly review of the Federal Reserve Bank of New York, for December. Pig iron, coal, and copper have been very much further below their normal trend, whereas the other articles partaking more of the nature of consumer goods do not show such decided divergences. This is significant for the machine tool industry. Our demand runs with iron, and not with sugar and tobacco.

"According to our own index figures all of these industries have recovered much more than the machine tool industry has. It is true that our barometer figures for November showed some improvement over October, but neither were up to September figures.

"Pig iron production continuing below the trend shows, of course, that metal working industries on the whole are not as active as some other industries. The railway car, locomotive and automobile productions are relatively good, but the railway car, locomotive, and automobile plants are amply able to take care of the orders, and need little new equipment.



In the above chart are shown the movements of wholesale prices of commodities from 1913 to November of the present year. The heavy dark line represents 33 commodities in iron and steel and implements. The dotted line shows the steady upward trend and decline in building materials, made up of lumber, paints, oils, glass, forty-eight commodities in all. The faint line is that of grains and fodders, fifteen commodities in all, including Eastern and Western grain. The chart is interesting as showing the relative postion, at the close of the present year, of three most important groups. While there has been a decline, the levels of 1913-14 have not yet been reached, the nearest approach being farm products.

"It is the general impression that next year the selling of automobiles is going to be quite a difficult task. Reductions in prices of automobiles indicate a lack of the sort of buying pressure that the automobile builder has come to consider as normal, and the selling of automobiles will not be so easy. The Wills-St. Claire and Earls reorganizations show that there are some weak spots in spite of the largest sales in the history of automobiles.

"The automobile field ought to afford some opportunity for machine tool demand if the salesmen really sell production. The competitive condition will demand reductions in cost to as great an extent as possible and that is where the real salesmen for the machine tool industry should come in with their best work. But as all indexes continue to point to some considerable weakness among various automobile concerns credit should be watched very carefully and the machine tool builder should insist on getting a fair proportion down in cash on all special machinery that he undertakes to build.

"It looks as though the best outlet for machine tools for some time to come will be for the railroad shops. Improvement of the railroad shops is being called to the attention of the executives and no doubt will result in some improvement in that direction.

"There is a lot of optimism evident in general business circles but a great deal of this is over-optimism. Every cloud is not yet off of the business horizon. Europe has not yet gotten down to business and our own radicals in Congress are doing all they can to stop improvement, so it would be injudicious to figure any very great activity in the United States. There is going to be better business for some months to come, but if in those months the unfavorable conditions are not removed, business will hesitate. It is not safe to assume that we are in for a long period of prosperity. It would be much safer to count on a rather short period that might culminate even before the end of 1923 in the machine tool line. We must remember that the farmers' purchasing power is not yet in balance with costs of the goods he buys. The farmers' demand for goods is not yet in full swing and is not likely to be during the next year. We shall probably witness a falling off in business, some time before the excessively optimistic imagine that it can be possible. Retail trade is not very snappy right now. So it will not do for the machine tool industry to be over-enthusiastic."

Pig Iron.—It has been an eventful year in the pig iron market—more particularly by reason of the events which conspired to curtail supply and demand. Most serious of all was the coal and rail strikes, which struck the market at a time when production was low, and demand somewhat backward. Prices in the first and second quarter ranged from $27.15 to $29.15. In August and September, when the full effect of the strike manifested itself prices jumped to 39.30. With the settlement of the strike this figure gradually declined. A low of 30.80 was reached early in December, but the year closes with an advance to 31.80. The market is strengthening, foundries are buying in a much more confident way and with a feeling that pig in the yard is more useful than pig in prospect. It is likely that Canadian furnaces will show an improved output early in the New Year.

Montreal

December 27.

MONTREAL:—There have not been any price changes in current warehouse values and the demand for all products continues along fairly quiet lines. Throughout the district there is an easing off of manufacturing conditions consequent upon the approaching holiday season and stocks are being reduced as rapidly as possible without replenishment until after the inventory date. Current prices:

Lake Copper	17 50
Electrolytic Copper	17 25
Castings, Copper	17 00
Tin	45 00
Lead	8 00
Spelter	9 50
Antimony	7 50
Aluminum	22 00

Pig Iron.—The advance of $1.00 per ton announced in the price of Canadian pig iron for this locality, finds foundries so well supplied that there is no little fresh buying going on. The importation of pig iron from the Old Country finished with the close of St. Lawrence navigation and it is not anticipated that shipment will be resumed until the opening of navigation in the spring. Local prices:

Algoma, No. 1, car lots on Tracks, nominal quotation	....	34 15
Summerlee, 80-ton lots, dock	35 00	....
Carron, 30 ton lots	35 00	....
Do., 5 ton lots, ex. warehouse	40 50	....

Pittsburgh

December 27.

THE prominent feature of the manner in which the steel trade is closing the year is the way in which production and shipments keep up. Usually there is a slowing down for December, partly because some manufacturing consumers slow down in their consumption and partly because buyers, whether distributors or manufacturing consumers, like to have the January 1 inventory as light as possible. A year ago, for instance, December saw a sharp dip in steel production, the No- being regained late in January. This year there is no more than holiday dip, and little even of that. Some mills, it is reported, intended to close for this holiday week, but found delivery requirements such that they concluded to run, stopping only for the holiday. There are a few closings of departments for the week, to allow other departments to catch up with them.

The monthly report of ingot production will probably show production for the month little if any less than the rate of October and November, which was approximately 40,000,000 tons of ingots a year, the highest rate since late in 1920.

Market Seems Steadier

Concurrent with the willingness of steel buyers to receive shipments at the same rates as formerly there is a holding up of prices of bars, shapes and plates, at the 2.00c level, better than was expected in most quarters. Possibly the market in these lines is even steadier than a month ago. Yet in some quarters it had been considered almost a foregone conclusion that these lines would be down by this time, as they had advanced proportionately more, since the low point of early in the year, than other finished steel products.

Pipe is probably the strongest item on the list, mills being far in arrears in making shipments, although they are gaining a trifle, while new business continues to come in freely. The Riverside plant, in the Wheeling district, which the National Tube Company (Steel Corporation) has put in operation after a long idleness, will be making practically full shipments by about the middle of January, and this will help materially, as the plant specializes on merchant pipe, which has been in the strongest demand of the various tubular goods.

It is reported that the American Steel & Wire Company has 15 weeks of business ahead in nails, which would mean that it can accept little business in nails for first quarter. It seems to be oversold on fence. Independents are fairly well booked, and the nail and fence markets are very strong.

Advance Bookings are Fair

Sheet business is coming in quite well for the season of the year. There is a very fair volume of early delivery business, which is placed without difficulty as some of the independents have not much business ahead. Others, particularly those making special finish sheets, are very well booked ahead. The leading interest is now filled for first quarter. It is now booking business for second quarter, although its formal book opening on November 23 was really for first quarter only. The market is at 2.50c for blue annealed, 3.55c for black, 4.35c for galvanized, and 4.70c, 4.85c or 5.00c for automobile sheets, according to time of delivery and other conditions.

Tin plate production in the past year has been about 1,400 000 gross tons, the record, made in 1917, being a trifle over 1,500,000 tons. Regular domestic consumption was probably the highest, however, as there were light exports and light demand for tin plate for mak-

(Continued on page 152)

A Better Year

BEFORE us is a better year—a better year than any year since the war.

The material prosperity and purchasing power of a country are measured by its production. Production as indicated by this year's preliminary reports was never so favorable in recent years, all of which must inevitably bring about a marked stimulus in every line of commercial endeavor. Canada faces a better year.

We face a year in which we will be better able to demonstrate the ability of our national organization to serve you—a Dominion-wide organization supremely equipped in all essentials of the machinery business and with over 50 years' experience.

You will need new equipment to cope with this new era of prosperity. We can supply you. You will need advice regarding the tools best suited to your requirements. Our engineering staff is at your service.

The most advanced designs of metal and woodworking machines are included in our stock—as well as electrical equipment, small tools, and factory supplies.

Should you favor the purchase of used equipment you will find our remanufactured lines equal to all requirements. This equipment has been completely overhauled, rebuilt and tested in our own thoroughly equipped plant.

How may we serve you in 1923?

If it's Machinery—Write "Williams"

Improved Tools and Equipment Are Essential

Modern Methods in Workshop Can Alone Reduce the Cost of Making—Cannot Blame Antiquated Practice on the Mechanic —Railways a Large Factor—Immigration Necessary

By GEN. SIR ALEX. BERTRAM

THE MACHINE tool industry in Canada, whilst not at a standstill, is what one can term poorly occupied, and I am not pessimistic when I say that the probabilities are that it will continue in its semi-dormant condition for some time to come. It is a well-known fact that the basic barometer of the machine tool trade is the purchasing power of our railroads. Their requirements in their own engine shops, and in the shops allied to the railroads, are a large factor in the machine tool trade.

While the railways may not govern the prosperity of Canada, their own financial and operating ease is the mark of our trade conditions. Their shortage of traffic and the high cost of transportation has hampered the prosperity of the Dominion. When the financial position of our railways improves they will be able to purchase the new and improved tools and equipment which will reduce labor costs. For instance, in one railroad machine shop I know of, they were able to secure one new piece of machinery to replace four obsolete machines, and that one machine did more work and better work than the four old ones. It saved the wages of eight skilled mechanics.

Industrial conditions have changed very fast in Canada during the last quarter century. Many of the important centers in Canada not long since had factories for making steam engines and boilers. Electricity has replaced the steam engine, and has restricted this important industry. The result of this restriction is that large factories have had to be adapted to the production of other manufactures. Much of their equipment has gone to the junk shops. Other have been closed up altogether, because the men were trained to the making of engines and boilers, and the owners could not or would not take up anything to replace the work.

Capital Inclined to be Shy

Practically the same elimination process has taken place in the making of agricultural implements. Towns in Ontario and Quebec had their implement factories as a basic industry. This has all been changed. A few large organizations control this industry in a few cities, and their efficient equipment produces as much of the finished article as did twice the number of men a quarter century ago. The refusal of the farmer to bear his share of taxes and the consequent granted demand for a free entry of American farm machinery has made capital shy of further investment in farm machinery plants. The American response to this abolition of customs duty was the usual one—the Canadian farmer was shut out of their markets entirely.

Yet it is the trained engineer who has been chiefly responsible for the changing conditions, insofar as it tends to cheaper production through the lower costs of more speedy and efficient construction. The engineer, the mechanical engineer, is the greatest revolutionizer in the world to-day.

Industry is Stabilized

Our water power, our water sites that were given away for a song some thirty years ago, are now recognized as one of our greatest national assets. The electrical engineer has utilized electricity for developing our water powers, and he has generated untold electrical power therefrom. This has made wonderful changes in our manufacturing conditions. It has steadied and stabilized our everyday industries.

We have power equipment and railway lines for ten million of a new population. We have land to keep busy an agricultural addition to our population of twenty millions. We require more people to cultivate our land, and we are all glad to see that there are men in Parliament who are alive to this fact, and that some effort will be made at once to induce real farmers to settle in Canada.

I know that the high cost of production hinders capital from venturing in new enterprises. It is difficult to reduce wages. The high cost of living and the low purchasing power of the dollar precludes any present reduction in the living wage. Capital is timid. It is easily scared. The noise of the agitation and the disturbance of a rough-house strike makes a man who has saved money lay it by in a safe hole. Money can make a quicker disappearance than quicksilver when it is threatened by demagogues in the legislative halls of any country.

New Methods of Production

The only means of overcoming the high cost of production, and the only way to attract capital is to secure and to show improved methods of production in factories now established. I have referred to one instance where a new machine in a railway shop cut the labor cost to one third on one important operation. This can be done in many industries.

The engineer is calling for improved tools and equipment. The machinist resents the fact that he is compelled to work with poor tools and obsolete equipment. The official in charge finds it difficult, yet, impossible, to induce the owners to buy the new equipment, even though they may know that improved methods in the workshop can alone reduce the cost of making. The owners control the financial end, and no doubt they have their worries in financing. Yet, new, modern, efficient and money-saving equipment is the only speedway to prosperity.

During the war period our Canadian manufacturers proved their methods when they had the proper financial backing. They spent vast sums in purchasing up-to-date tools and machines for the production of munitions, and when the last chapter of the munition work was on, then it was found that Canada had outstripped the world in quantity and in man-for-man production. And 'twas all done in a careful and studied reduction in the time for each operation, in a smooth and systematic run from the raw material to the finished article.

Antiquated Methods Inexcusable

I am an optimist, a cheerful one. When we know what one must do and proceed to do it, then conditions are bound to improve. They will improve. Antiquated methods cannot be blamed on the mechanic. The high cost of wages must continue so long as the three essentials of life and the pursuit of happiness cost so much more—rent, food and clothes.

Today it is up to the man who has saved the fruit of his labor—the thrifty man—the real man who holds the purse strings. Will he invest his money in the promotion of industry? Has he faith in the growth and prosperity of Canada? I vow he has, and that he will. I was going to term the man who holds the purse a capitalist. Every man who saves, every man who is not shiftless, thriftless and inert, is an asset to Canada and a capitalist.

REGINA, Sask.—Industrially the year has been quiet in Regina, with very little expansion.

The Steele Briggs Seed Co. have established their western headquarters in the city, coming from Winnipeg where they had been located for many years. The Canadian Chemical Products Co. have recently put in a very good plant for the manufacture of household requisites. From a distribution standpoint, which is, of course, Regina's strong suit, there has been very little development owing to conditions that have obtained throughout the year. On the strength of the excellent crop we look forward to a more active season next year.

350 to 400 Per Hour

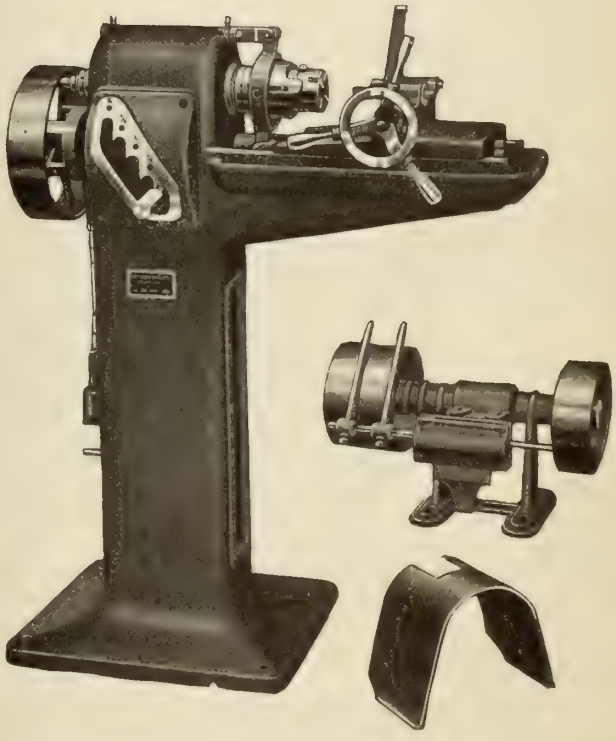
of These Aluminum Wireless 'Phone Receiver Caps Are Threaded on a Geometric Threading Machine

The Thread is 2.180″—24 U.S.

The Connecticut Shop where the work is done gives the Production Figures, and the New York concern for whom the Caps are made, confirms them.

The Self-Opening Die Heads with which the Geometric Threading Machines are equipped are also used for rotating on other types of machines, such as Drill Presses, Bolt Cutters, and machines of similar operation.

Various types of Geometric Die Heads and Collapsing Taps give a correct finish to Screw Machine and Turret Lathe.



¾ Inch Size Geometric Threading Machine—Complete with Countershaft and Oil Hood.

News From the Industrial Field

Sarnia.—Fire caused $25,000 loss at the Imperial Oil Co.'s plant when one of the agitators exploded.

Oshawa.—According to assessment figures, Oshawa's total population is now over 14,000. The village of Cedardale, with 1,300, was recently annexed.

Vancouver, B. C.—Plans have been prepared for the erection of a building designed especially for transportation company offices. The estimated cost will be about $100,000.

United States Steel Corporation are now operating at 83 per cent. of capacity, the highest production rate this year. Buying from the oil and motor car companies is particularly strong.

Peterboro.—A college that will take care of the first two years of university work is proposed for this city. It would be a means toward relieving overcrowded classrooms in many Canadian colleges.

Two hundred Danish families, all farmers, from the north of Jutland, intend emigrating to Canada. The Government, it is reported, has promised to place land and facilities for farming at their disposal.

To connect with the Imperial Oil tank farm at Coutts, Alberta, a pipe line is to be run from the Sunburst-Kevins oilfields in Montana, and it is proposed to build a 1000-barrel refinery in Southern Alberta.

Employment officials sizing up the prospects for next Spring, predict that unemployment will reach zero, and that there is likelihood of a labor shortage. Much engineering work is in process or being planned which will absorb hundreds of men.

According to grain export statistics, the Canadian farmer has not been seriously affected by the American tariff. During October and November farm products exported amounted to $15,601,954 as against $17,633,141 in the same period last year.

For manufacturing and assembling motor cars, Henry Ford will build a $6,000,000 factory in Chicago. It is expected that this in time will rival the Detroit works. First of the proposed four units costing $1,500,000 it is expected will be employing 4,000 men by next May.

Mount Royal Hotel, which has just been opened, is the largest in the British Empire. It has employed 1,500 men in its construction for the past year. The site is 306 ft. x 227 ft. Electric wiring in the building is 150 miles in length, requiring 60 miles of conduit and the phone system is of 2,000 station capacity.

Two garages and several stores were destroyed by fire in Sturgeon Falls, Ont. Several motor cars, and considerable hardware stock were in the loss which is estimated at $175,000.

A Napier-Cub Aero engine, weighing 2,200 pounds, without fuel or water, and capable of developing 1,000 horse power, was recently given a successful test at Southampton. It is the largest aero engine of its kind in the world.

Locomotives which generate their own motive power, and able to maintain an average speed of 120 kilometers an hour, with 12 coaches weighing 45 tons each, are proposed for the French railroads. Naptha is used for fuel. The locomotive is the invention of a Russian.

Car ferries operating on the cross-the-lake route between Cobourg and Charlotte, N. Y., have been very busy up to the present time this season with practically no interruptions on account of weather. Considerable coal has been moved.

At a meeting of building trades and builders' representatives in Toronto, the rate of wages for union bricklayers and stonemasons was fixed at $1 an hour for 1923. The rate and agreement are practically the same as in 1922, and so far as building trades are concerned, are not likely to be changed.

E. Long Manufacturing Co., Orillia, manufacturers of sawmill equipment, are employing 60 men at present. Business is said to be exceptionally good. The plant has sufficient orders to run until next June. Part time and part staff were run up to November 1st, but at present men are being daily added to the force.

Metal Shingle and Siding Co., Preston, and Montreal, and the Western Steel Products Co., Winnipeg, have made an arrangement whereby the offices of the former in Manitoba, Alberta and Saskatchewan, will be closed Jan. 1, and the latter company will take charge of the business of the two companies in the four provinces

Welland:—Announcement is made of the incorporation of the Eastern Steamships Company, Limited, with head office at Port Colborne, and a capitalization of $1,000,000. Buffalo steamship interests are behind the organization, and a Dominion Charter has been secured.

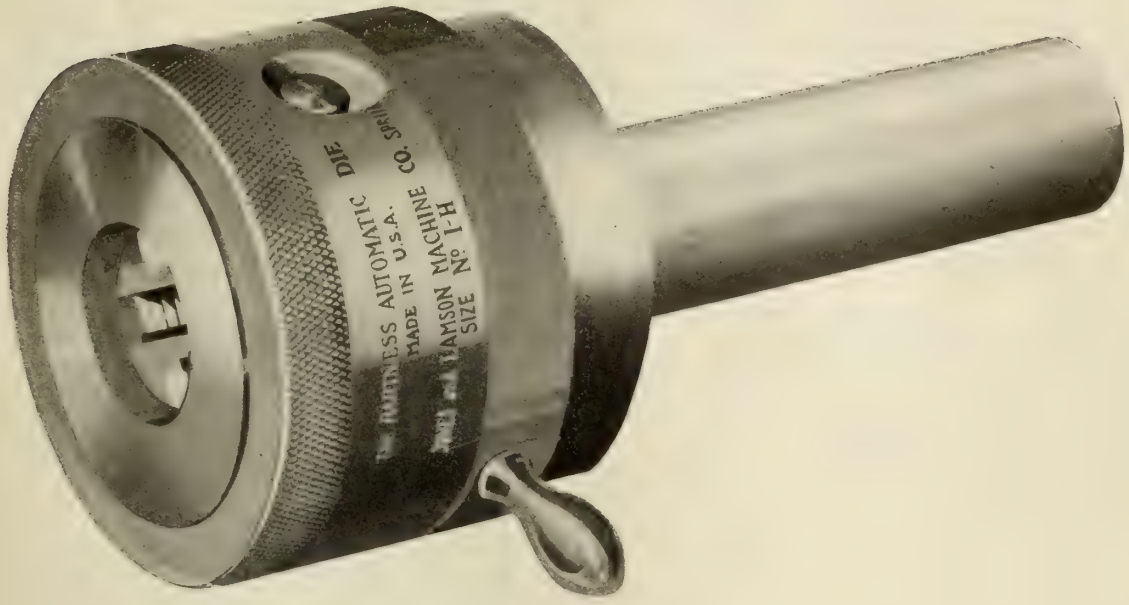
It is stated the company will put a fleet of ten steel steamers on the route between Buffalo and Montreal. The project is an alluring one. Grain rates from Port Colborne to Montreal run about 7½ cents while the Buffalo-Montreal rate is 17 to 20 cents. Shortage of storage at Port Colborne is an additional factor in the calculation.

A. J. T. Taylor, Vancouver, has been appointed vice-president and managing-director of the Combustion Engineering Corporation, Toronto, in the organization of which he took a prominent part. The company has two large contracts on hand in the erection of a power plant for the Imperial Oil Co., at Calgary, and the installation of a large pulverized coal power unit at Walkerville, Ont.

Swedish locomotive builders are to promote business among the South American republics by sending a deputation of salesmen in a sailing yacht to the more important cities. They will be armed with suitable literature, and the president and several of his technical experts will direct the expedition. Swedish builders have just delivered the two hundredth locomotive on an order to the Russian Soviet.

According to information received from Mr. Knowles of the Harmer-Knowles Motor Truck Co., Toronto, they have appointed Major L. H. Ingram, (late Canadian manager of Republic Truck Sales Corporation) to take charge of their sales department. At the present time this firm have in course of erection a new factory 100 x 125 ft. of brick construction. The design is such that there will be only two pillars in the entire building. It is being built to their special requirements and will be occupied about February 1st, 1923.

Canada this year has a wheat crop of 340,000,000 bushels. A C. P. R. statistician estimates that to move this crop it would take 257,250 (40-ton) grain cars loaded to capacity, or 7,350 trains, running at intervals of five minutes, 252 days to pass a given point. Placed end to end these cars would make a train 1,946 miles long, or one extending from Montreal to a point 26 miles west of Swift Current, Sask., or from New York to Denver, Colorado. Allowing thirty-five cars to a locomotive, it would require 7,350 to haul 257,250 cars, which would make a total length of cars and locomotives combined of 2,060 miles. The largest trans-Atlantic C. P. R. freight carrier is the S. S. Bosworth, with a capacity of 352,000 bushels of wheat. It would take 974 steamships of the Bosworth's capacity to carry the wheat crop of the Prairie Provinces across the ocean. Taking the Bosworth's gross tonnage at about 6,000, this would mean a fleet of 5,844,000 gross tons, or the largest mercantile fleet in the world with the exception of the United States and the United Kingdom.



Announcement—

We present a new design of threading tool known as

THE HARTNESS *High Speed* AUTOMATIC DIE

One size is now in stock and ready for distribution. Made in two styles:

No. 1-R, Revolving type, for threads 3/32″ to ⅝″ diameter.
No. 1-H, Stationary or hand operated type, for threads 3/32″ to ⅝″ diameter.

Hardened and ground throughout, including cam surfaces and chaser pockets.

High speed chasers carried to full high speed hardening heat. Thread form of chasers ground and lapped—the logical counter-part of the ground tap.

High Speed Chasers only supplied.

JONES & LAMSON MACHINE COMPANY

Springfield, Vermont, U.S.A.

INDUSTRIAL NEWS

(Continued from page 150)

Canadian Oil Co., whose plant at Petrolia was recently destroyed by fire, will rebuild at once.

D. H. Howden Co., London, wholesale hardware dealers, propose the erection of a warehouse to cost $50,000.

Metal Stampings, Ltd., Toronto, report improved demand for stamped domestic goods. Orders well into the new year represent a fair volume. The plant employs thirty men.

Precision & Thread Grinder Mfg. Company, Philadelphia, wish to announce that F. Rodger Imhoff, formerly sales manager and consulting engineer of the company, is no longer connected with the present organization.

That the law respecting inspection of steam boilers be extended to include those used for agricultural purposes, was the recommendation of a jury that enquired into a fatality caused by a boiler explosion on a farm near Delhi, Ont.

Sarnia.—Because it is alleged that he failed to report arrears of money due the local Hydro, J. E. B. Phelps was recently dismissed as manager. He was, however, recently elected to Sarnia Hydro Commission over his opponent Jas. E. Crawford, who is said to have been primarily responsible for Phelps' dismissal.

In connection with the erection of their new machine shop, on which an expenditure of $1,500,000 is proposed, the following contracts have been placed: Steel: Canadian Bridge Co. Ltd., Walkerville; grooved wood block flooring, F. B. Goodman, Toronto; reinforcing and steel sash, Trussed Concrete Steel Co. of Canada Ltd., Walkerville.

EXTENSIVE POSTAL SERVICE

Ten Thousand Persons Are Employed By the Canadian Post Office Department

Over half a billion letters and post cards were carried by the Department in the fiscal year ended March 31st, 1922. In addition, the Department handled 350,000,000 newspapers, 50,000,000 parcels, and 250,000,000 circulars, making in all well over a billion missives carried for the Canadian public during the past fiscal year. The Department issued postal notes, and money orders to the value of $295,000,000, of which sum money orders represent $270,000,000 and postal notes the balance. Money orders issued and handled by the Department totalled 10,000,000; postal notes 6,000,000; Canadian orders issued on Great Britain 520,000; British orders issued on Canada 55,000; Canadian orders issued on the United States 680,000; and United States orders issued on Canada 340,000. In all 15,595,000 money orders and postal notes were issued and handled in the year ended March 31st, 1922.

Pittsburgh

(Continued from page 146)

ing containers for exported oil. The market is firm at $4.75 for 100-pound cokes.

Foundry Iron Prices Up

The demand from the east for Connellsville coke for domestic use has continued and has sent the price up farther, as high as $9.00 being paid on a lot of 25 carloads for eastern distribution, while a fortnight ago the market was easy at $6.50 for good grades of furnace coke. The eastern demand has cleaned up all coke, including some that was of doubtful value for metallurgical purposes. This outside demand has put the blast furnaces in awkward position, as they expected cheaper, not dearer, coke, when they sold foundry pig iron at $25 valley, for first quarter.

Partly on account of demand, partly on account of the bulge in coke prices, foundry iron is now up to $27 valley. One furnace interest succeeded in contracting for first quarter coke at not over $7.00, before the advance occurred, but others are left uncovered and faced with what is obviously a fancy price. Basic iron, which is offered by steel interests as well as merchant furnaces, is held at $24.50 valley, against some recent sales at $24.25. Bessemer remains at $27.50 at which price a few stray carloads have been sold.

Foundry coke is held at $8.50 to $9.00. Thus far foundries have not been buying to any extent, objecting to the sudden advance.

DELEGATES DISCUSS RECENT CONFERENCES

That much good must accrue to international trade from the recent Pan-Pacific Conference held recently at Honolulu, is the conviction of Thomas Roden, delegate of the Canadian Manufacturers' Association, who reported to a special meeting of the Ontario division. The session brought together a large number of manufacturers, and great additional interest centred in the report of W. C. Coulter, chairman of Industrial Relations Committee, who represented Canadian employers at the International Labor Conference at Geneva, Switzerland.

Mr. Roden pointed out that the object of the Pan-Pacific conferences, of which this was the fourth, was to bring the peoples of the Pacific ocean together to see in what way they might benefit by exchange of views. Countries represented were: Canada, Australia, United States, China, Japan, Corea, Salvador, Mexico, Fiji, Phillipines, Peru and New Zealand. Discussions were largely in the nature of reviews of important matters pertaining to the different countries, such as natural resources, railway facilities, hydro-electric development and education.

Proper regulation and development of natural wealth and resources of the different countries were considered, and also the means of co-operation, looking to proper use of facilities such as wireless for broadcasting information.

The lack of such information explained much of the antipathy evident in these nations toward western countries.

Discussed Labor Problems

W. C. Coulter, as the representative of Canadian employers at the the Geneva Labor Conference, said that, as part of the League of Nations, the functions of the conference had to do with the consideration of factors making for industrial peace. Resolutions were brought forward which, while not compulsory, were submitted for the serious consideration of member nations. Employers, employees and governments were represented.

The sessions this year had to do largely with a review of the work of former conferences, but certain changes were proposed that would have deprived Canada of her place on the executive body as a state of industrial importance, had it not been for the fight put up by Canadian delegates. Referring to the resolution endorsing the eight-hour day and 48-hour week, it was pointed out that only five nations out of 55 had so far ratified this basis of work.

European Conditions

As an observer of European conditions, Mr. Coulter stated that Canadian industry had few problems as compared with some of the countries overseas. A German delegate had told him that wages in his plant were, as a rule, adjusted upward every fortnight, and that the greatest increase had been 95 per cent. These increases were due largely to advances in living costs. When customers took from 30 to 60 days to make payment, it was evident that original values would increase from 25 to 50 per cent. between the time of production and time of payment. Yet German industry seemed to be making headway under these precarious conditions.

In Switzerland, conditions were not much better. Exchange was high and export business beset with difficulty. There was considerable unemployment. In Holland also, exchange was high. Domestic trade was very bad. The market was flooded with German goods. Because of this the cost of living was very low, but exports were booming.

In France there was no unemployment. Exchange was about one-third normal. Industrial conditions were good and people from other countries are being brought in to relieve labor shortage. Two-thirds of the French people are on farms.

As to deductions from these conditions, Mr. Coulter said he preferred not to express himself. He described them for what they were worth.

"A Better Saw For Every Use"

Necessity of First Aid in Industrial Plants

IN THE early days, before Canadian industry became as highly-organized as it is today, accidents of both minor and major importance were of frequent occurrence. The unfortunate victims of these accidents did not receive prompt attention. Often a workman who received a small scratch contracted blood-poisoning as the result of the scratch being infected before medical attention was received. The result of such accident was that the workman was off for weeks without pay, and the employer was deprived of his services for that lengthy time. As time went on both employers and employees recognized the necessity of prompt attention to workmen's injuries, and saw that legislation should be provided which would be beneficial to both parties.

In the year 1915 the Workmen's Compensation Act was passed by the Ontario Legislature. This Act provides that a workman who receives injury while at work that necessitates his absence from business for a period of 7 days or more shall receive compensation from the Workmen's Compensation Board. The board receives its monetary requirements from a tax levied upon the employers in the industries in which the accidents happen. This Act in itself is enough to show the necessity for first aid, as the fewer the number of accidents and the less serious are results of them, the less money employers and board alike require to pay.

Herewith are a few figures regarding accidents, taken from a report issued by the chairman of the board in April of this year. In an industrial army of about 450,000 workmen, 45,191 accidents were reported in 1921—386 of them fatal. There were 272,000 accidents—2,784 of them fatal—during the 7 years' operation of the Act, which is a total equal to the population of Hamilton, Ottawa and Windsor.

Might Have Minimized Trouble

Many of these accidents might have been prevented, and a large majority of those attended by fatal results might have been minimized had the victims received first aid promptly. A large number of minor injuries, such as cuts, wounds, scratches, skin abrasions and burns become dangerous through infection. Were these slight accidents promptly reported to a first aid officer for attention, they could be properly sterilized and disinfected, and the dread blood-poisoning averted. The figures respecting blood-poisoning cases are startling. From six to nine per cent. of all industrial accident cases have infection at some stage. In 1920 the nine per cent. of blood-poisoning cases included 56 cases of joints immoblized by infection, and no less than 24 deaths due to infection. This is a terrible toll and surely calls for drastic measures.

We have spoken of promptly reporting accidents, even of slight nature, to a first aid officer, who should be an employee trained in the first aid course. His duties should be to keep the first aid kit up to standard; to give prompt and efficient application of first aid, should an accident occur. The best first aid man, of course, is the surgeon himself, and first aid work by the layman should be restricted to immediate stopping of hemorrhage and transportation. After that he should be taken care of promptly by some man who can follow through the courses. The experience of industries who have a man on the staff who can follow the patient in the hospital is that results are better, the man is back to work to work earlier, and he is also happier. Experience also shows that long convalescence means a loss of morale, the idleness in long convalescence produces all sorts of neurotic conditions. In this respect the patient's own activity is often more beneficial for actual recovery than other method of treatment. To bring this about there should be co-operation among employer, surgeon and employee to secure for the man favorable tasks for each period of convalescence.

It is well known that a small percentage of industrial plants have the necessary first aid equipment. To those employers who have not yet supplied their plants with first aid kits or first aid rooms, the Act requires that all plants having 15 workmen and less than 300 shall provide suitable first aid kits, and where more than 300 are employed a suitable first aid room must be maintained in charge of a clerk, workman or nurse, who has taken a recognized course in first aid to the injured.

The Industrial Accident Prevention Association, Toronto, has done much to make information available with reference to standard equipment and the operation of first aid rooms.

EMPLOYMENT STATISTICS FOR INDUSTRIAL GROWTH

(Continued from page 140)

two principal metal mining districts in Canada. The decreases so reported have been about 5 cents per hour in most cases, averaging about 5 per cent.

Time Lost On Strikes

The following table shows the number of strikes reported as having occurred in certain selected industries during the first ten months of 1922, together with the number of workers involved and the approximate time loss in working days. Owing to strikes in the coal mining areas of Nova Scotia and Alberta the time loss in these selected industries was much greater this year so far than during the whole year of 1921, when less than 8,000 workers were involved in strikes with a time loss of only 210,000 working days.

The table also gives the total strikes, etc., for all industries, from which it will be seen that nearly two-thirds of the total time loss occurred in the coal mining industry.

Strikes in First Ten Months of 1922

Industry	No. of Disputes	No. of employees	Time loss in working days
Manufacturing iron and steel products:			
Crude, rolled and forged products	1	16	4,080
Steel, shipbuilding and repairing	2	1,370	8,690
Others	4	53	153
Lumber and its products:			
Rough and dressed lumber	1	8	112
Logging	1	150	1,350
Mining:			
Coal	9	23,577	1,199,579
Construction and Maintenance:			
Building	21	1,831	39,667
Railway	3	99	873
Canal	1	40	240
	43	27,144	1,254,744
All other industries	39	12,339	610,308
Total all industries	82	39,483	1,865,052

An analysis of the principal causes of the strikes in the industries selected and the manner in which they were settled will be of interest:

Cause	Employees	Time loss (days)
For increased wages	**15,306**	**267,277**
In favor of workpeople	236	1,488
In favor of employers	717	7,435
Settled by compromise	14,353	258,354
Against reduction in wages:	**9,605**	**976,082**
In favor of workpeople	7,904	938,968
In favor of employers	760	26,743
Settled by compromise	326	8,646
Indefinite, unsettled	615	1,725
Other causes	**2,233**	**11,385**
	27,144	**1,254,744**

Are You Prepared for Accidents?

NO MANUFACTURING plant is free from accidents. Accidents happen in the best of regulated plants despite any number of safety devices. Take whatever precautions you may there comes from time to time the necessity for treating persons in your employ who have suffered from accident—or sickness—and who require immediate attention.

Have you the facilities for giving relief to the injured or sick workman? For your own protection and the protection of your employees a "first aid" department should be installed in your plant.

Our experience in the fitting out of plant hospitals and smaller "first aid" rooms is extensive, and we know exactly what to suggest for the nature and size of plant. Nothing is too large or small for us to handle.

Take for example the photograph shown. Here is a very neat, inexpensive hospital installation, which we can place in your factory at a very low cost.

Write us for full particulars.

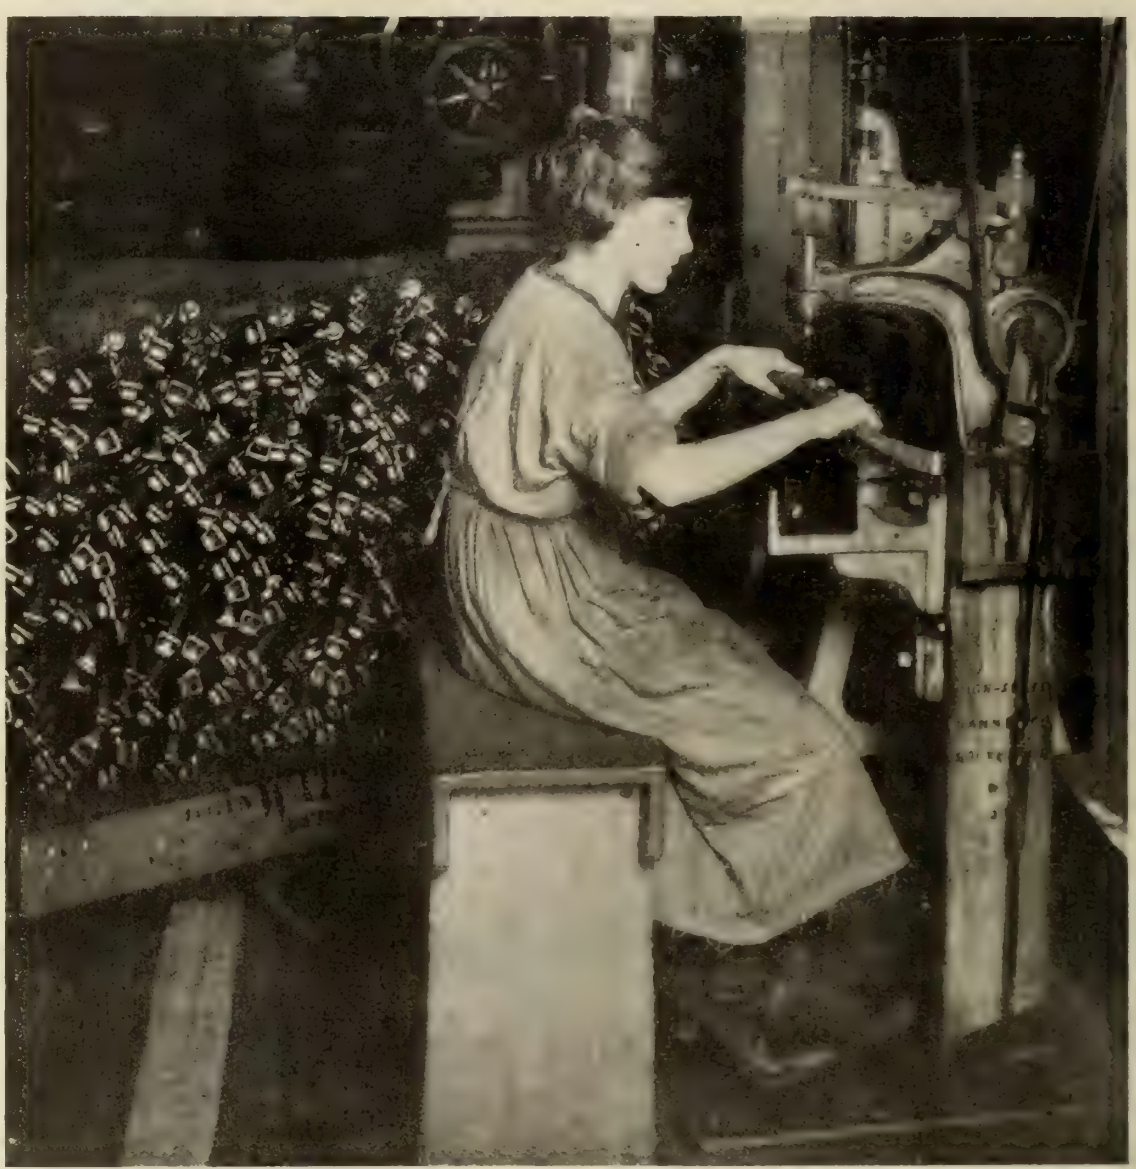
Lower Production Costs with



ANOTHER example of High Speed Hammer production in a Canadian plant is shown in the illustration above. The operator is shown rivetting harness parts (hames) in the plant of the McKinnon Industries, of St. Catharines, Ont. Note the pile of work this operator has completed. Realize how long it would take to do this work by hand. Not speed in production alone, but the almost complete elimination of spoiled work resulted when this plant installed High Speed Rivetting Hammers—twelve of them in use here.

THE HIGH SPEED HAM

ROCHESTER,

If interested tear out this page and place with letters to be answered.

High Speed Riveting Hammers

HERE are two illustrations of High Speed Hammers at their cost-cutting work in Canadian plants. These tools are demonstrating every work-day of the year that the High-Speed-Hammer way of rivetting long run jobs is the only way to keep production costs down to the irreducible minimum.

A remarkable feature of High Speed Hammer Rivetting lies in the fact that it gives production speed as well as first quality finish.

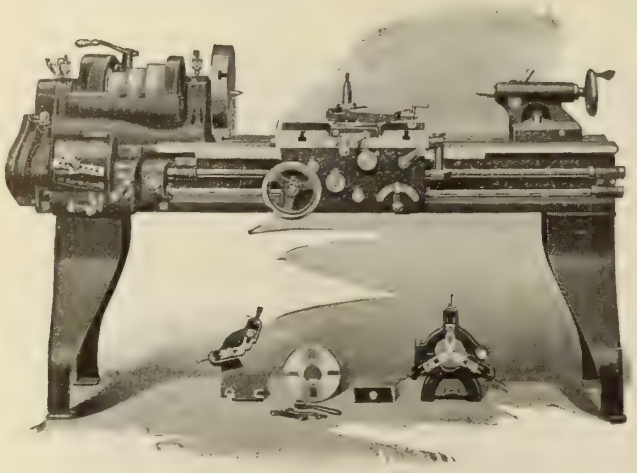
The illustration on this page shows a High Speed Hammer in the plant of the International Business Machines Company, of Toronto. The operator is "whistling" through parts of a recording machine. The quality of the rivetting must be of first quality--and the High Speed Hammer can always be depended upon to deliver the quality desired.

Have us advise you on the adaptability of High Speed Rivetting Hammers to your class of work

MER COMPANY, Inc.

N. Y., U. S. A.

Small in Size but Big in Capacity



All Rockford machines are built in multiple lots, on the jig system, and all parts are completely interchangeable.

The
Rockford "Economy"

has many features that make it an ideal lathe for the tool room, general repair work, etc., where rapid production and accuracy are essential. Though small in size it also is of sufficient weight and power to meet the demands of the up-to-date manufacturing plant.

It has 32 changes of threads and speeds through sliding steel gears and hardened steel clutches. Extra gears may be substituted on the quadrant, giving an almost unlimited range.

The Rockford "Economy" is built in 12, 14, 18 and 22-inch sizes. **Write for complete description.**

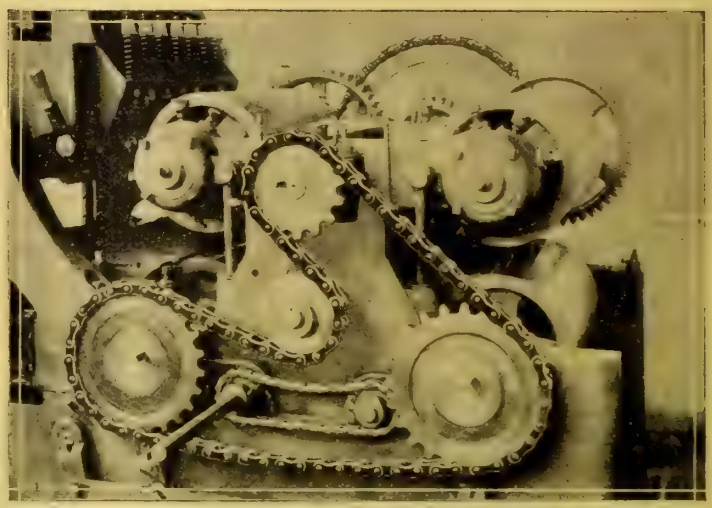
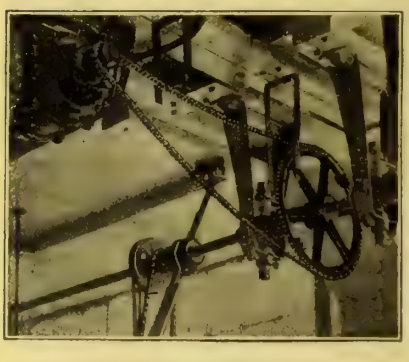
DIAMOND
Chains and Sprockets

Photo at right shows section of a P. B. Yates Wood-Working Machine, with DIAMOND Chain Drives.

Below are listed a few of many other applications in which these drives are used:

Baking Machinery
Canning Machinery
Mining Machinery
Dairy Machines
Agricultural Machines
Machine Tools
Paper Making Machines
Textile Machines
Wood-Working Machinery





More and more factories are using overhead chain drives from motor-to-line shaft.

On Taylor Automatic Stokers, Diamond Chain Drives run in oil-tight cases.

Drive It With Diamond Chains and Sprockets

For practically every place where power-transmission units are used—whether for light, high-speed electric motors, or for slow, heavy-duty machines—DIAMOND Chains and Sprockets make dependable drives that give efficient service at low yearly cost.

They save power and speed up production, because slippage is eliminated and friction reduced. They avoid shutdowns and costly repairs, by giving steady, trouble-free service. They are used extensively for power transmission and conveying purposes by mills, mines, factories, canneries, power plants, railroads, etc.

DIAMOND Chains are made from strong, durable steels, accurately machined and heat-treated by correct methods. There are fifty standard chain models in the DIAMOND line—ranging from ⅛ to 1¼ inches in width, and from ⅜ to 2 inches in pitch. This variety of sizes will meet practically all requirements. DIAMOND Sprockets are made in types and sizes to suit individual drives. Our sprocket department is in position to give to you unusually attractive prices on your sprocket specifications.

Let our engineers aid you in solving power-transmission problems, and in selecting suitable chains and sprockets for your drives.

"Useful Data on Diamond Chain Drives"

This handy, loose-leaf book is valuable to every engineer and designer. It gives simple rules for choosing the correct chain and sprockets for each drive. You'll find it of real help. Your free copy is ready—write for it NOW.

12½ Machine Hours Lost

Each Time This Belt Was Laced By Hand

In a Michigan factory (send for the name) where 25 machines are driven from a single shaft, a broken belt means 25 idle machines. Lacing the belt by hand took 30 minutes and wasted 12½ hours. Now the Clipper method saves 10 of these 12½ hours.

Today one man and a thirty-six dollar Clipper machine instead of four millwrights, take care of the 1600 belts in this plant—light and heavy duty and high speed belts of leather and composition from 2" to 12" wide. Due to the speed the Clipper method and the superior strength and longer life of the Clipper joint, the company's books show a ***clear saving of $2500 a year over*** the obsolete way of hand lacing.

Based on a large number of belts, this total figure is exceptional. Yet our files contain equally convincing reports on the experience of hundreds of Clipper users, large and small. Authentic data has been gathered from busy officials to convince executives that maintenance costs ***will come down*** wherever the Clipper is used. A letter or postcard will bring it to you without cost.

STEEL gives strength—*greater strength.* But scientifically fabricated steel is *light.* This combination in the "American" Pulley insures the delivery of *all* the available power with the *minimum* of bearing friction or other waste.

"American" Pulleys are *split*—which means quickest installation with least interference.

These two principal characteristics combined mean maximum pulley efficiency. Write for free book giving all details.

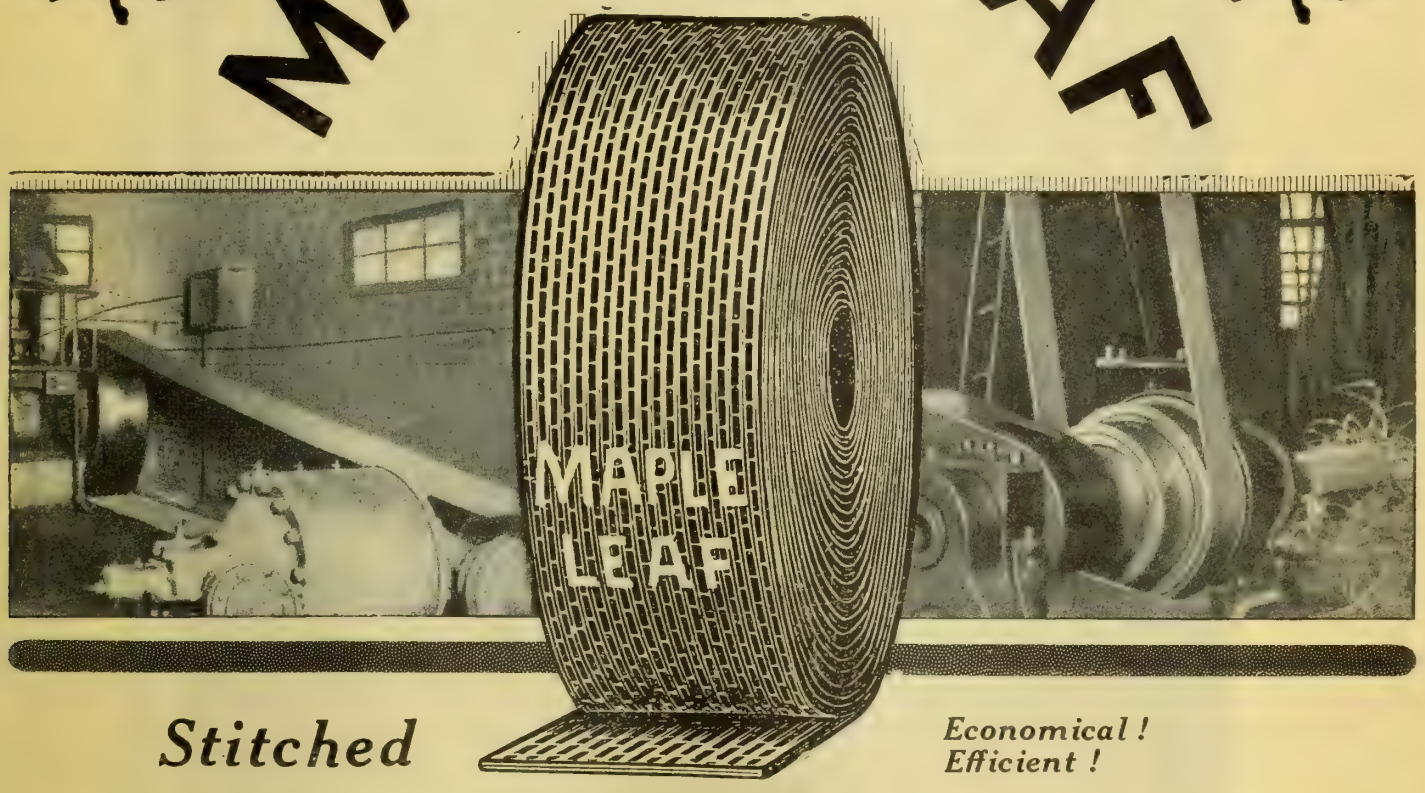
MAPLE LEAF BRAND



Stitched

Economical !
Efficient !

Cotton Duck Belting

Costs Less Than Leather, Rubber or Balata

FOR transmission of power or conveying purposes, Maple Leaf Brand Belting is as efficient as any belting you can buy. It costs less than leather, rubber or balata. Figured on a basis of "service per dollar," it is the best belting buy on the market. It is strong, durable, economical, efficient and true running. Satisfied users throughout Canada will verify these statements. We will gladly send samples and prices on request.

MAPLE LEAF DRESSING—BEST FOR ALL BELTS

Maple Leaf Belt Dressing does not contain resin, mineral or animal oils or other ingredients harmful to belts. All belts should have an occasional application of a reliable dressing in order that the best results be obtained. We recommend Maple Leaf Belt Dressing as the safe and sane treatment.

CHAIN YOUR MOTOR TO YOUR MACHINE

Flexible as a Belt—
Positive as a Gear—
More Efficient Than Either.

PERFORMANCE proves Link-Belt Silent Chain to be the ideal method of transmitting power. With it you can transmit practically the full power of the motor – without slip. 98.2% efficient on actual test, is its record. It is compact, positive, permitting the location of the machine where maximum efficiency dictates. It saves space by permitting motors to be closely coupled to machines, with drive at short centers. Because of its positive, uniform application of power, production is increased, and the product is often bettered.

Two Silent Chain 80 H.P. Drives

300 H.P. Drive From Motor To Beater Line Shaft

What the Supt. of a large Rolling Mill says:-

"When we erected our rolling mill in 1914 the question of what we should use for driving the mills came up and it was either chain drives or gears. Our decision rested with Morse Silent Chain Drives because first, of their reputation, second, because they were more economical than gears, third, because there was less chance of breakage with Morse Chains. Two 600 H.P. Morse Chain Drives are driving our rolling mills and practically all our motors about the Plant are also now equipped with Morse Chains.

"Our first which was one of the 600 H.P. was purchased eight years ago and today it hasn't cost us anything for repairs and has given us absolutely no trouble. This is merely typical of our experience with this equipment. Our Morse Drives have had unusually hard usage for easily 50 per cent of the time they have been in operation practically 24 hours out of each day on work that is a severe test because the load is not constant."

UNION DRAWN

BRIGHT COLD FINISHED STEEL

SHAFTING

We manufacture Bright, Cold-Finished Steel in Rounds, Flats, Squares, Hexagons and Special Shapes for Pump Rods, Piston Rods, Roller-bearing Rods, etc.
Cold Drawn or Turned and Polished Alloy Steel.

3½% Nickel Steel.
1% Nickel Steel.
Chromium Steel.
Chrome Nickel Steel.
Chrome Vanadium Steel.

For use in manufacturing parts where greater strength and toughness are required than ordinary Cold Drawn Steel.

Besides maximum strength and accurate size you get absolute straightness and highly polished surface in UNION DRAWN, BRIGHT, COLD-FINISHED STEEL PRODUCTS.
Large stock constantly on hand to meet demands for prompt delivery.

Union Drawn Steel Company, Limited

Hamilton Ontario Canada

SOLID WOVEN
HAIR BELTINGS
"TWINTEX" and "MULTIPLAR"

NO PLIES TO OPEN UP
PROTECTED EDGES
Can be used with any shifter
SUPER-GRIP DRIVING SURFACE
MAXIMUM FLEXIBILITY
CONSTRUCTION THAT LASTS

Belts are thoroughly waterproof and not affected by atmospheric changes.
Have proven themselves the best belts under most trying conditions of moisture and heat. On the larger widths a friction-heat-absorber-face is woven on the Driving Side. This absorbs the heat generated by the friction of driving and keeps the wear and tear off the body of the belt.

Why Don't You Write?

HARDLY a week passes that Canadian Machinery does not receive copies of this paper returned by the postal authorities because of the change in firm names or the address of some whose names are on the mailing list. Sometimes complaints reach us of the non-delivery of mail matter. It is not till the receipt of such complaints or the return of the paper, as the case may be, that we obtain any knowledge of the changes or removals of persons or firms. The adoption of the co-operative spirit on your part by notifying changes would make things a good deal more pleasant for both parties. The MacLean Publishing Co. want their mailing list to be in such shape that they will be able to render the perfect service to their subscribers. There is a lot of valuable trade matter mailed by this company and if you don't receive it—well, the fault is entirely yours.

Bond

POWER TRANSMISSION

BOND PRODUCTS have stood the test for over forty years, and is a complete line of Power Transmitting Appliances.

To meet the demand for Ball Bearing Transmission Appliances we have secured the manufacturing rights for, and now offer, a BOND BALL BEARING HANGER BOX (fitted with SKF Ball Bearings), which can be used in any standard lineshaft hanger.

This feature enables you to change to Ball Bearing equipment with a minimum of expense as the hanger frames you have installed can be fitted with Bond Ball-Bearing Boxes.

Why not make the change to-day?

We also manufacture Bond Ball Bearing Loose Pulleys (illustrated above). These are guaranteed to operate at any speed and are easily installed.

Write for literature to-day using coupon below.

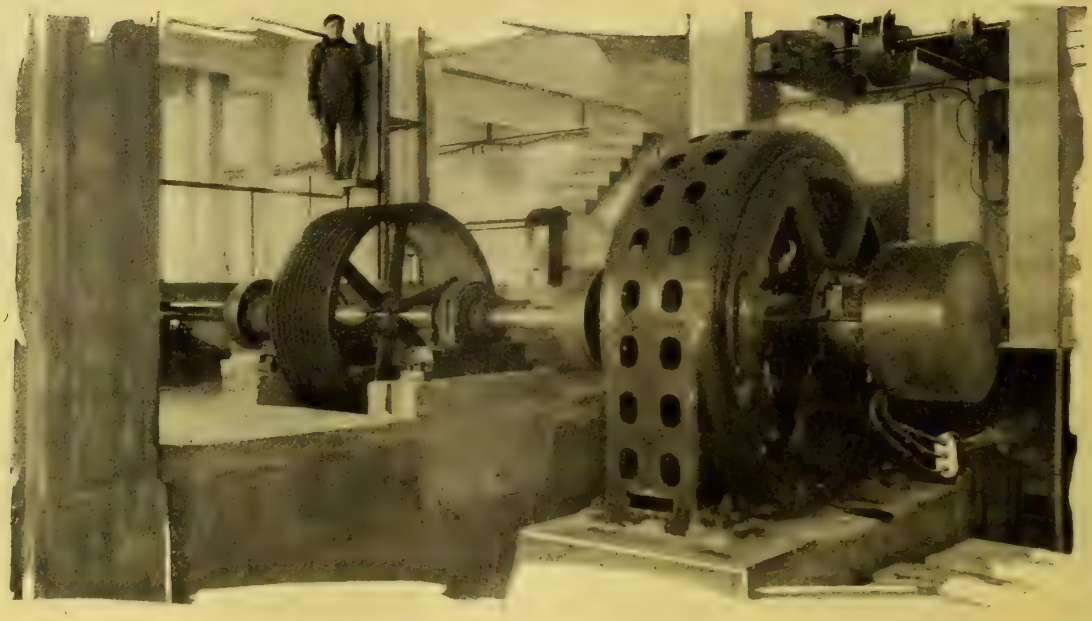
SKF



15 Per Cent Upwards—Power Saved
by Ball Bearing Pillow Blocks and Hangers

MOST vital of all losses in grain mills is the waste in power caused by the frictional resistance in plain bearings in power distribution systems. More than fifteen per cent of the power generated is wasted in overcoming this useless load.

Of this power absorbed by plain bearing equipped shafting, approximately 60 per cent can be saved by using SKF improved self-aligning ball bearing pillow blocks and hangers.

Shafts thus supported are carried by two rows of hardened steel balls that roll between polished steel races and without appreciable friction or wear. Even shaft deflections cannot cause heating and binding for the inner race tilts with the shaft like a ball and socket joint.

Furthermore, there is no worn shafting, no need for bearing adjustments and replacements, no vibrations and no oil leakage. Engineering details on request.

To Forge Ahead-

Canadian Industry Must Make Dependable Products

Canada is immensely rich in mine, forest and field products, and water power potentialities. Her natural resources form the basis of her future prosperity. If Canada is to forge ahead, her manufacturers, however, must establish a name for dependable products.

If you are a builder of motor trucks, pleasure or service cars, machine tools or other manufactured lines, use only dependable parts and fit them together with

"GALT" Screws and Nuts

"GALT" products are always accurate and made of the best material for the purpose. "GALT" Screws and Nuts, because they have established a reputation for accuracy, have become the preferred lines for the building of all classes of Canadian-built trucks and automobiles. Specify "GALT" and get accuracy and service on your next order for Cap and Set Screws and Nuts.

Send your blueprints for Estimates. We specialize on immediate shipments of all standard products.

Riveting Costs Slashed by the New "KOBERT" Method *of Production Riveting!*

IN THE FISHER BODY PLANT, Detroit, Mich., top body irons are now riveted on the KOBERT ELECTRIC RIVETER at only two-fifths the cost of former methods! At the same time Fisher's well-known quality standards are maintained.

Six men, six gas furnaces and multiple riveters are replaced by one "KOBERT," a man and a boy! As against four rivets per minute by former methods, an output of six perfectly formed rivets, 7/16 in. square is now possible. A single 40-ton blow fills the hole completely.

Best of all "KOBERT" has eliminated the costly straightening and the heavy rejection item due to the inevitable warping and shrinking of the metal in the furnaces. The ability of "KOBERT" to concentrate the heat on the exact spot where needed, revolutionizes riveting practice, not only in work like the above, but especially where temper drawing has been a problem (roller chain, ring gears, roller bearings, etc.).

This "KOBERT" reduces floor space required from 1000 sq.ft. to about 100 sq.ft. Hot weather labor trouble, due formerly to the excessive heat, is no longer a disturbing factor. Fire hazard also eliminated, and energy cost reduced to one-fifth.

"KOBERT" has opened the way to lower costs of production riveting. It will pay you to let "KOBERT" engineers co-operate in analyzing your particular problem without obligation.

TRADE NORTON MARK

Alundum

Crystolon

The grinding wheel is being used more generally to-day than it was a year ago. It is replacing other tools because work can be ground faster, cheaper and more accurately to dimension limits and with a superior finish.

The properly selected NORTON ALUNDUM or NORTON CRYSTOLON wheel will insure you of these features and when we say economy we mean lower grinding costs ultimately—computed from wheel, labor, and burden cost figures.

Some one of the following subjects would undoubtedly interest you :—

Grinding High Speed Steel
Saw Sharpening
Tool Grinding
Grinding Wheel Dressers and Their Use
Diamonds for Truing Grinding Wheels
Metal Polishing
Storage, Handling and Supervision of Grinding Wheels
Principles of Cylindrical Grinding
Safety As Applied to Grinding Wheels

We have special treatises in pamphlet form on these subjects, a postal request for which is all that is necessary.

REMEMBER

To specify NORTON ALUNDUM wheels for grinding steel and soft malleable iron and NORTON CRYSTOLON wheels for cast iron, brass and aluminum.

The "Bite" of a File

The "bite" of a file is the measure of its efficiency.

A file the least bit dull cannot bite like a perfectly sharp file. And more effort is required to make it bite at all.

This means economic waste —of effort, time and money. True economy lies in replacing a file the least bit dull with a new, sharp file.

These standard brands retain their sharpness till they have given maximum service:

Two 3 phase Kaelin Electric Steam Generator Units for 6600 volts, designed and built by us for the Laurentide Co., Limited. Capacity of units shown, 7000 boiler horsepower, all controlled by a single operator on each shift.

The generator shown at the left is typical of sizes from 75 to 400 boiler horsepower for 3-phase power. Note its compactness and convenience.

"Can our idle power be made to conserve our coal pile?"

If you will Tell us your Conditions we will give you the Answer.

A number of plants producing or purchasing power but not using it fully at week-ends or other periods are turning this surplus energy into heat by means of

The Kaelin Electric Steam Generator

(Patents applied for)

thus securing remarkable reductions in their bills for coal or other fuel.

The saving in labor is also quite important. Altogether, the generator often pays for itself within a short time.

We build these generators in sizes from 5 to 3,500 boiler horsepower, for pressures up to 200 lbs.; also in sizes from 5 to 75 boiler horsepower for low pressure steam heating.

When desired, any of these generators may be equipped with automatic pressure or surplus power control.

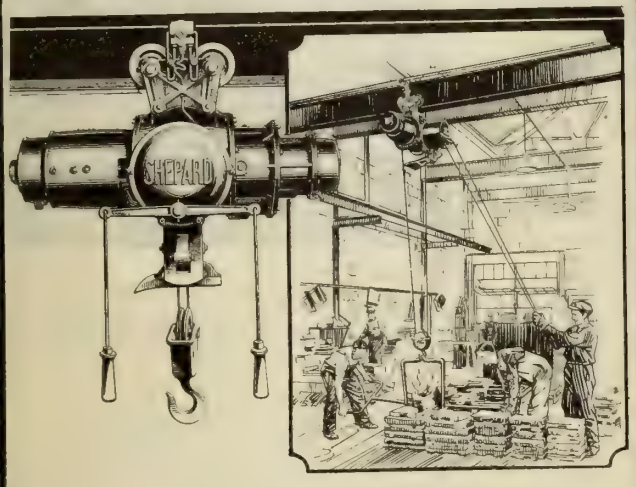
The "Aerial Railway of Industry," of which this Shepard cage control hoist and Transfer crane are a part, affords rapid transit between departments without rehandling load. Ask about it.

THE SHEPARD ELECTRIC LIFT ABOUT



A powerful little hoist that is now used in practically every industry.

½ and 1 ton capacities. Remarkably low in price, due to standardized manufacture and quantity production. Has same "time tried and true" features as found in other Shepard equipment.

Electric hoisting and rehandling equipment that lasts

The Shepard Balanced Drive, which is used in all Shepard equipment, thorough, automatic oil bath lubrication: enclosed unit construction; and "endurance" built into every part—all combine to give you what you seek in crane and hoist service—strength and permanence.

Shepard builds electric traveling cranes; transfer cranes; jib cranes; floor and cage control hoists; and electric winches. Competent engineers are always at your service. Call upon them.

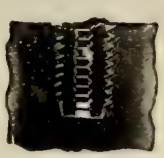
DIAMOND SAW & STAMPING WORKS -:- BUFFALO, N.Y., U.S.A.

Buried in the Work and Broke!



Next time a tap breaks below the surface of a large casting, don't let some make-shift method of removing it injure the thread and waste half an hour of valuable production time. Instead—

Walton it Out in a Jiffy

And save the casting.

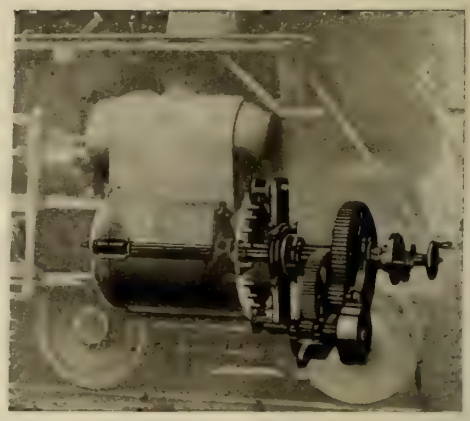
Special analysis steel fingers of the Walton Extractor drop into the flutes of the broken tap—and grip. Then a few turns of a wrench applied to the squared end of the Extractor backs out the buried tap.

Sixty-day trial offer proves the Walton Extractor pays for itself. Write.

The Walton Co.
Hartford, Conn.

UNDERWOOD PORTABLE TOOLS

Figure What You'll Save On One Job Alone

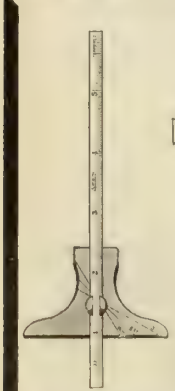


THERE'S no sense in taking down your engine every time it needs boring when all that is necessary is to remove the cylinder covers and piston and take the

Underwood Portable Boring Bar for *Stationary Engines or Locomotives*

right to the job. You can appreciate what a saving of time and labor this is—just figure what it will save you on one job alone and then write for catalogue.

H. B. Underwood Corporation
1025 Hamilton St., - Philadelphia, Pa., U.S.A.

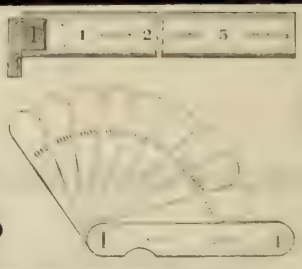


LUFKIN RELIABLE MECHANICS' TOOLS

APPEAL TO EVERY PROGRESSIVE MECHANIC

Accurate, and having all the other essential qualities of precision tools; also many improvements which mean better work, easier done.

Their nicety of design and finish appeal to the eye. Their performance day in and day out will hold your approval.



Ask your dealer to show you a LUFKIN Send for Catalogue of Mechanics' Tools.

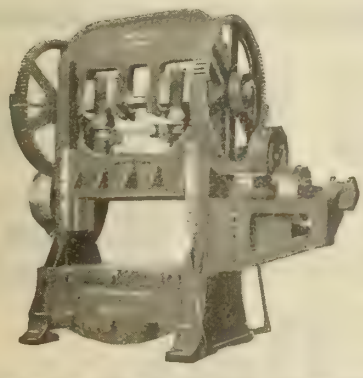
The "TOLEDO"

Presses, Dies, Shears, Drop Hammers, Cam Drawing Presses, Circle Cutting Shears, Double Seaming Machines, Forging Presses, Horning Presses, Knuckle Joint Presses, Shovel Making Machinery, Spinning Lathes, Sprue Cutters, etc.

THE "TOLEDO" OPEN BACK PRESSES:

Series Nos. 1 and 70. Built in 30 sizes, weighing from 500 to 60,000 lbs. They are adapted for a great variety of work, including nearly every kind of blank cutting, forming, perforating, drawing, shaping and combination die work. Illustrated in the "Toledo" Catalog, Section No. 2-A.

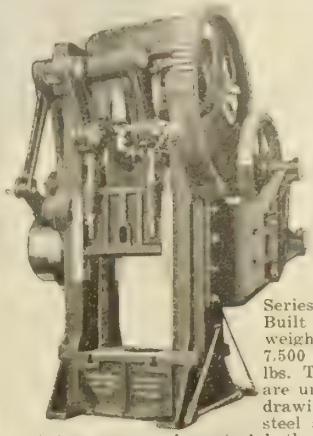
THE "TOLEDO" DOUBLE CRANK PRESSES:



Series Nos. 90 and 200. Built in over 200 sizes with either Straight Column or Overhanging Frames, weighing from 1,500 to 500,000 lbs. For cutting out and forming large articles in tin, brass, copper, sheet steel, cardboard, paper, cloth, etc. Among these may be mentioned automobile parts, armature discs and segments, large pieced tinware, coal hod bodies, shingles, tanks, tin and paper signs, shovels, circular saws, steel stoves and ranges, steel car parts, metal furniture, metallic caskets and burial vaults, wash boilers and tubs, etc.; also for hot and cold forging and trimming drop forgings. Also used for multiple gang punching or perforating, and for operating several different kinds of dies, where special work requires a series of operations one after the other, or for operating duplicate dies in gangs.

Illustrated in The "Toledo" Catalog, Section No. 7-A.

THE "TOLEDO" TOGGLE DRAWING PRESSES:

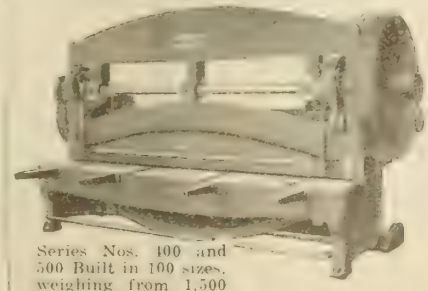


Series No. 160. Built in 50 sizes, weighing from 7,500 to 650,000 lbs. These presses are unexcelled for drawing stamped steel and enamelled ware, seamless steel bath tubs, metallic caskets, automobile bodies, radiators, steel stove parts, elevator buckets and innumerable other articles made from brass, copper, aluminum, steel or tinplate. Illustrated in the "Toledo" Catalog, Section No. 8-A.

THE "TOLEDO" PUNCHING PRESSES:

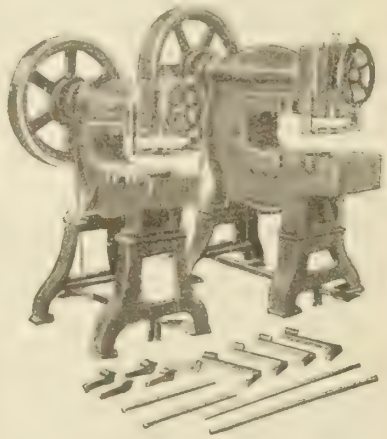
Series No. 30P. Built in 15 sizes, weighing from 700 to 15,000 lbs. These presses are extensively used for a large variety of work, being especially suited for punching, shearing and cutting out blanks of heavy metal steel, iron, brass, etc.; for operating trimming and forming dies, using bar and sheet metal stock. Illustrated in the "Toledo" Catalog, Section No. 4-A

THE "TOLEDO" SHEARS:



Series Nos. 400 and 500 Built in 100 sizes, weighing from 1,500 to 100,000 lbs. These shears are noted for the ease, rapidity and accuracy with which they perform their work. Illustrated in The "Toledo" Catalog, Section No. 11-A.

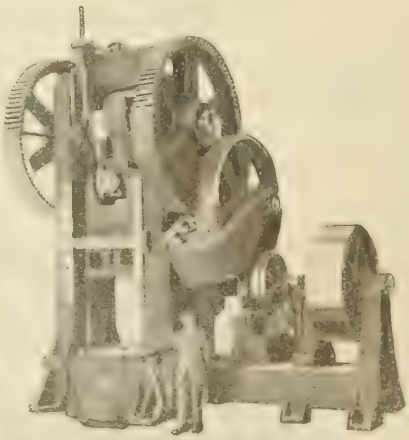
THE "TOLEDO" DEEP GAP PUNCHING PRESSES:



Series No. 15. Built in 3 sizes, weighing from 1,500 to 7,500 lbs. These "Toledo" Presses are particularly adapted for range boiler, steel range, automobile and various other classes of work where it is required to punch holes at a distance from the edges of wide sheets.

They are intended for operating the "horseshoe" gauge system for multiple perforating with single dies; also for cutting the cleanout and other small openings; for punching, perforating, etc. Illustrated in The "Toledo" Catalog, Section No. 4-A.

THE "TOLEDO" STRAIGHT COLUMN PRESSES:



Series No. 50. Built in 70 sizes weighing from 3,000 to 150,000 lbs. Largely used for working the heavier gauges of metal, such as for operating embossing, cutting and drawing and reducing dies, for punching, piercing, shaping and stamping heavy blanks, etc., as well as for a general line of deep drawing, reducing and forming operations, also for cold forging. Illustrated in The "Toledo" Catalog, Section No. 6-A.

The TOLEDO MACHINE & TOOL CO., Toledo, Ohio, U. S. A.

"CANADIAN"
HAND POWER PUNCHES AND SHEARS

All Canadian hand power punches and Shears are made with "Armor Plate" frames.

This frame construction consists of a rolled steel plate having a tensile strength 7½ times that of cast iron. This strength permits of a machine much lighter and more compact than is possible with either cast iron or cast steel.

Let us know your punching and shearing requirements. We have an "Armor Plate" machine for the service. Remember our Armor Plate line comprises power operated machines as well as hand power.

Announcing to the Canadian Industries

the "BOX" *Electric* LOAD LIFTER

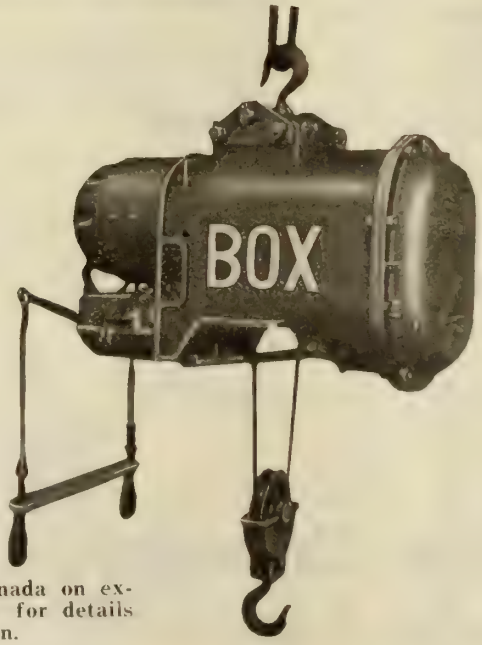
A New, Smaller and Better Electric Hoist

Built for everyone who has a load to lift or move.

A powerful electric hoist that may be easily and quickly hung up any place, indoors or outside; or installed on an I-Beam track hung from the ceiling.

This small "LOAD LIFTER" will let you lift up and move more loads of any kind, so much faster, and with less help, that you cannot now afford to use even the most efficient "man power" devices.

Send right now for complete information on this unique "LOAD LIFTER" and let us tell you what it could do for you in your business.



The "Load Lifter" is built for the man who must lift loads of 1000-lbs. or 500-lbs. or less, and needs to do it in the most economical manner. Its cost is surprisingly low—the operating expense negligible.

Distributors wanted for Canada on exclusive agency basis—Write for details of this attractive proposition.

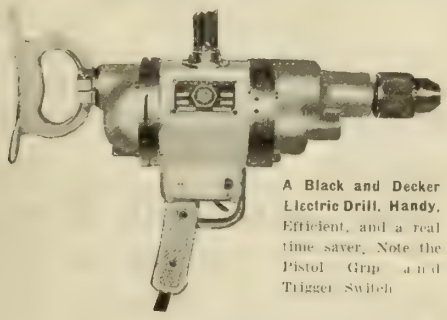
'RICE LEWIS' NEWS

Machine Shop Supplies

In addition to the tools shown, we carry a full line of machine shop supplies, including Set Screws, Cap Screws, Machine Screws, High Speed and Carbon Drills, Files, etc. Our assortment of machinists' tools is varied and well worth looking over.

When it comes to Micrometers, we carry only the best lines. Take for example the set shown above. It comes in a neat case, and is not expensive when the quality of product is considered. We have a wide range of these tools in different sizes and invite you to come in and look them over, or write for prices and particulars.

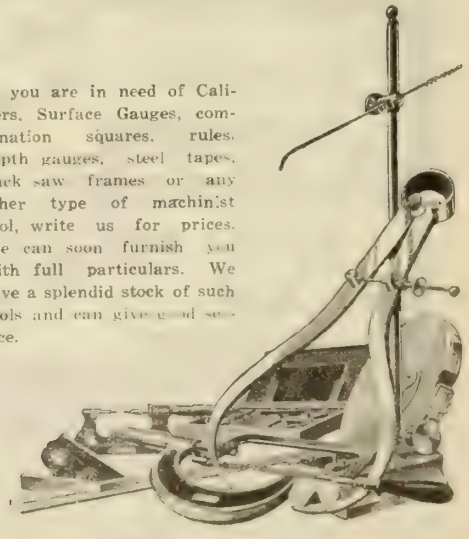


A Black and Decker Electric Drill. Handy, Efficient, and a real time saver. Note the Pistol Grip and Trigger Switch

Attention is called to the new Special Price on Black and Decker ¼ in. Electric Drills. The price is now only **$36 net.** We carry a good assortment of these drills in the following sizes: ¼ in., 5/16 in., ⅜ in., ½ in. Special for repair work, ½ in. Heavy for general construction work, ⅝ in. and ⅞ in. capacity. We also have a good assortment of "Thor" Electric Drills in stock.

We stock Electric Drills from 1-4 in. to 7-8 in. sizes.

If you are in need of Calipers, Surface Gauges, combination squares, rules, depth gauges, steel tapes, hack saw frames or any other type of machinist tool, write us for prices. We can soon furnish you with full particulars. We have a splendid stock of such tools and can give good service.



Hack Saw trouble is often due to the operator using the wrong type of blade. Victor hack saw blades are made in Flexible and All Hard grades. There is a blade for every purpose. They are guaranteed, and are made from a high grade alloy steel. Get a box today and try them. We can ship them to you from stock.

"The Tools You Buy Again"

Butterfield

Taps, Dies, Drills, Reamers and Cutters

For Better Service

YOUR mechanics appreciate tools of QUALITY in their milling, drilling and reaming operations, and when provided with such tools they turn out a bigger and better day's work. Furnish your mechanics with Butterfield tools. Compared with any ordinary drills, reamers or milling cutters, the Butterfield line cuts faster, more accurately and require less regrinding. They cost no more than ordinary tools. Try them—they are "the tools you buy again."

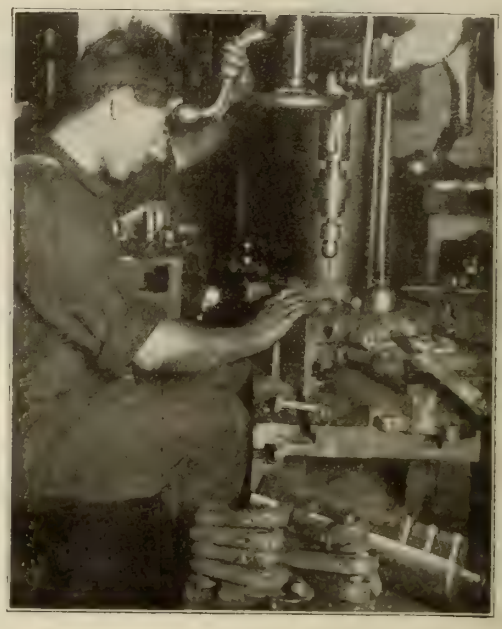
SAVE TAPS and TIME



THE "PROCUNIER" Patented DOUBLE-JAW CHUCK

is an insurance against Tap breakage. It provides a firm grip that does not mar the tool shank; a straight true drive protected by a safety friction device that releases the tap the instant it strikes a hard spot or touches bottom.

The "Procunier" is the only device on the market having a balanced reversing mechanism which eliminates all side pull or torsion. Its reverse speed is twice that of its forward speed.

The Procunier Line includes tapping devices of all kinds of work for all machines. Our illustrated circular shows them in operation. Let us send it.

WIRE ROPE

Wire Rope made in the country in which it is used is better adapted to local conditions than rope made in countries where the exact conditions of use are unknown and not understood.

Greening's Wire Rope has been made in Canada for sixty years. In this time Greening's close and exact knowledge of the Canadian field has saved users of wire rope inestimable time and expense.

This thorough knowledge and the unvarying quality of Greening products have made them the accepted Canadian standard.

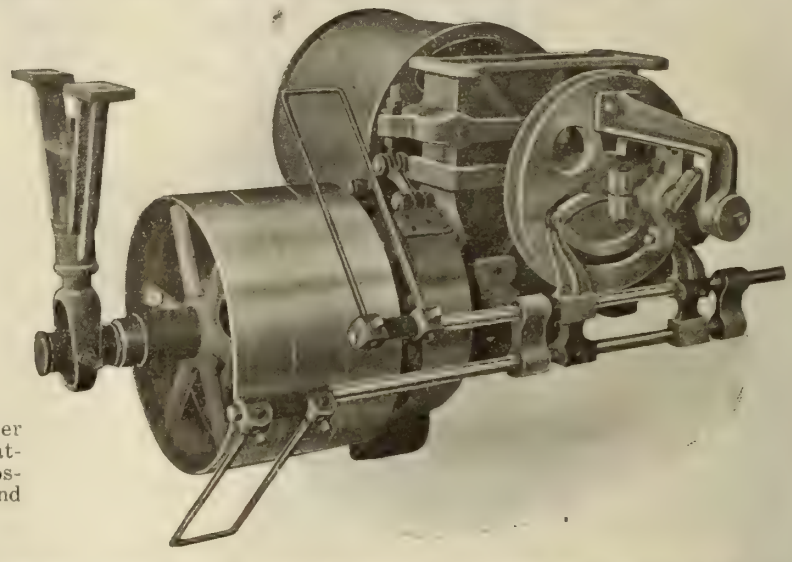
ROELOFSON

Electric, Hydraulic and Hand-power Freight and Passenger Elevators and Dumb Waiters.

WORM-GEARED BELTED FREIGHT ELEVATOR

The Simplest and Best Elevator Made



Some of its features:

Equipped with self-adjusting brake. Has phosphor bronze gears. It is noiseless and smooth-running, self-oiling and dust-proof. Capacity, 1,000 lbs. to 10,000 lbs. Absolutely safe and reliable! In addition to Electric, Hydraulic and Hand-power Freight Elevators we make Passenger Elevators, Dumb Waiters, Motors, Toolroom Enclosures, Wire Machine Guards, Fire Escapes and Ornamental Iron. **Enquiries solicited!**

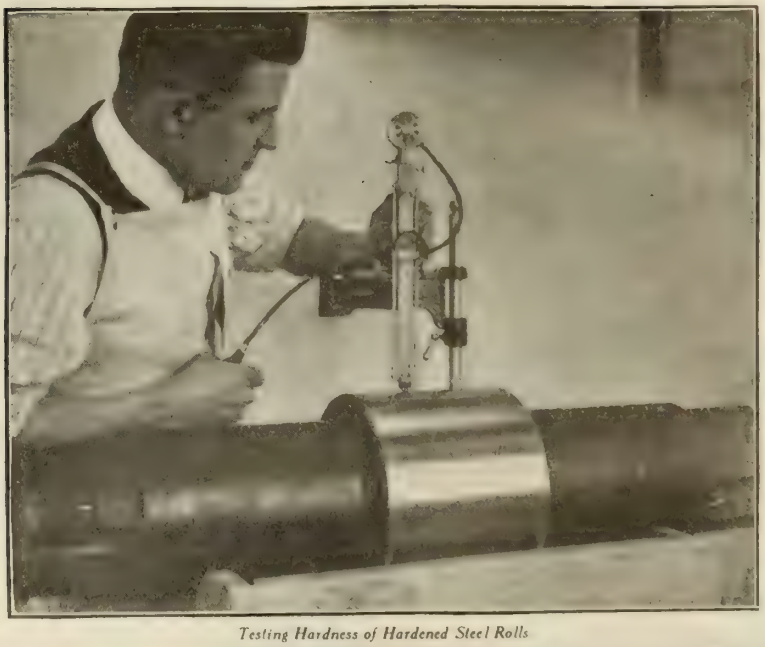
ROELOFSON ELEVATOR WORKS

GALT, ONTARIO

HARDNESS TESTING

Is now done almost exclusively with THE SCLEROSCOPE

(International Standard)



Testing Hardness of Hardened Steel Rolls

THE FINISHED ROLL SHOWN HERE COULD BE TESTED FOR HARDNESS ONLY WITH THE SCLEROSCOPE, BECAUSE:

(1). Competitive methods would ruin the finished surface.

(2). They could not discriminate on steel of super-hardness (over 100 hard).

(3). Too heavy to be mounted in the machine.

(4). Too slow to make required series of tests.

(5). The SCLEROSCOPE alone shows accurately resistance to deformation (260 tons per sq.in.).

(6). The SCLEROSCOPE can be carried to the work and applied instantly in the hardening room, mounted in the grinding machine or other stage of its manufacture.

Send for our latest booklet on Hardness Testing Mailed free.

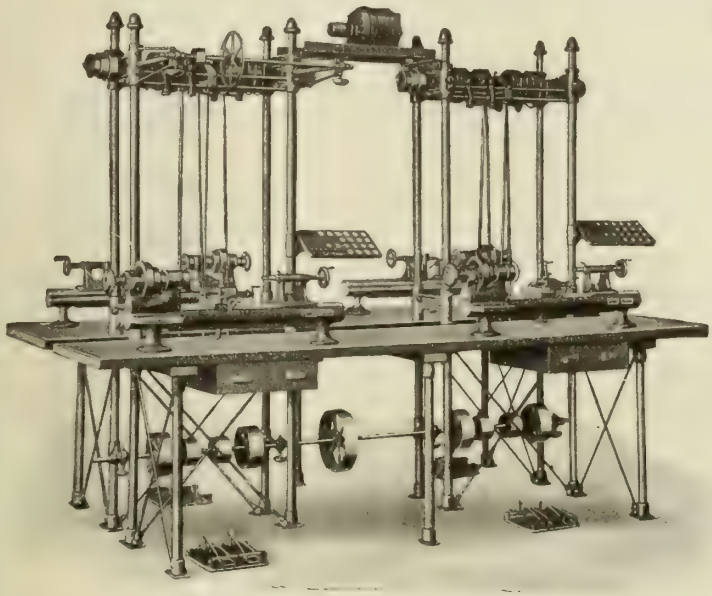
CATARACT PRECISION TOOLS

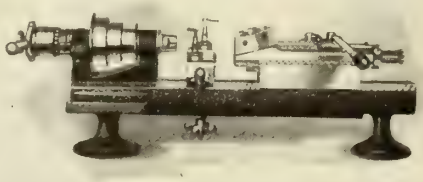
ARE TIME SAVERS



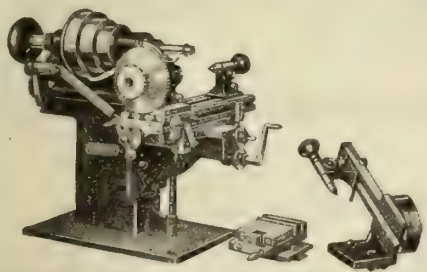
Cataract R-4 Double Bench Unit with Under-Drive.
(Details in No. 15 Catalogue.)

IF THIRTY MINUTES PER DAY IS LOST IN YOUR SHOP BECAUSE A MACHINE IS UNHANDY—or takes that much more time to keep clean and exchange fixtures and chucks—the price of the tool is lost many times during its life. Consider the small amount of time necessary to exchange fixtures on the CATARACT TOOLS. CATARACT TOOLS and Attachments have gained a worth while reputation in Canadian shops. There are many more where they would be appreciated and prove that our claims on their behalf are warranted. Best quality material, first-class workmanship, unexcelled finish, interchangeability of fixtures—are among some of the outstanding features of CATARACT MACHINES.

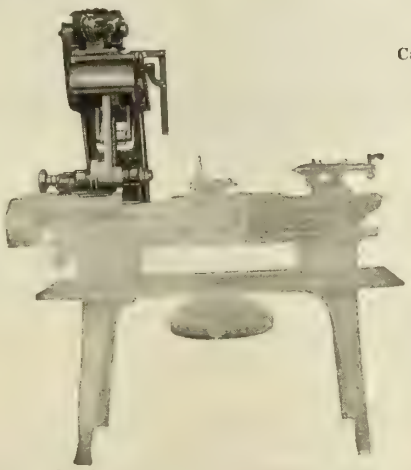
Below find illustrated several CATARACT TOOLS:



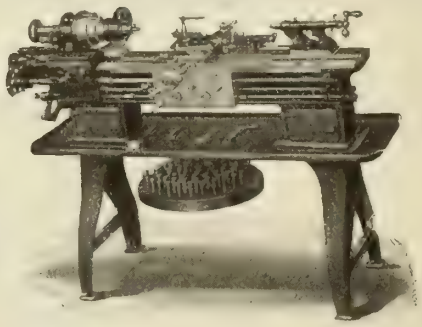
Cataract Bench Lathe with Turret Double Tool Cross Slide and Chuck Closer for the Manufacture of Duplicate Parts.



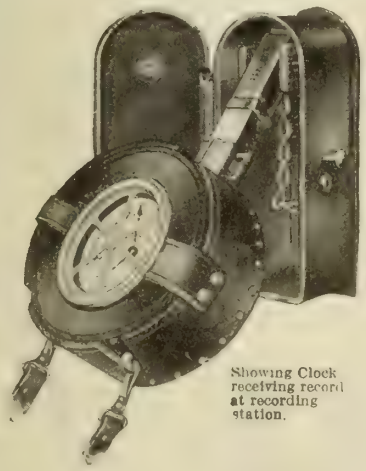
Cataract Bench Miller, with Horizontal Head.
(Details in No. 15 Catalogue).



Cataract Quick Change Swing Precision Lathe, with Motor Drive. (Special Catalogue for Details).



Cataract Quick Change Swing Precision Lathe, with Cone Drive.
(Details in Special Catalogue).



Showing Clock receiving record at recording station.

HARDINGE WATCHMAN'S CLOCK

What proof have you that your watchman is "on the job" all the time? How can you be sure he'll be on hand to notice any small blaze that might occur—one of those small blazes that often mean ruin if not caught in time? He's only human, you know. He may mean to do right but—supposing you **knew** he "slipped a round" once in a while—would you sleep easy? Let us tell you just how the Hardinge System will **protect** you absolutely. No wiring or other complications, the only tool needed is a screw-driver. We will install the system in your plant on a 30-day trial basis—all charges on us.

Cataract Machine Tools are sold in Canada by Garlock Machinery Co., Toronto. Hardinge Watchman's Clock is sold in Canada by Hardinge Bros. of Canada, Limited, 47 Wellington Street, East, Toronto.

HARDINGE BROS., 1770 Berteau Ave., Chicago, Ill.

Write us for our catalogue containing full details, specifications, illustrations of CATARACT TOOLS. Our Service Department is ready to confer with you. Correspondence from Canadian concerns welcomed.

Just Three Reasons—

Why Steele Wire Springs are the choice of practically all of Canada's leading manufacturers.

First—Their quality is so far superior to the ordinary kind of spring.

Second—Their price is fair.

Third—They stand up better and give better service under the most strenuous use than any other springs.

Our lines include Compression, Extension and Torsion Springs in steel, brass and bronze wire for every requirement.

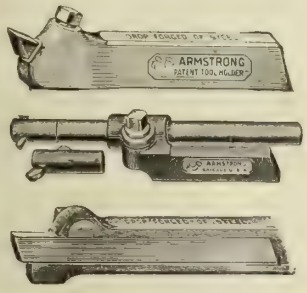
ARMSTRONG

TOOL HOLDERS



Don't tie up your capital in solid high speed tools when less than one-tenth the steel in Armstrong Tool Holders will do the work and save time and grinding wheels as well. There's an Armstrong Holder for every operation from the lightest to the heaviest.

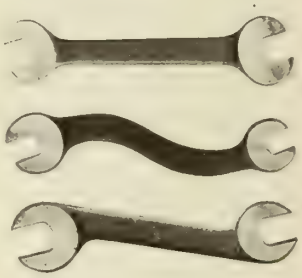
For Lathes, Planers, Shapers and Slotters.

WRENCHES

Drop Forged

Built for long service.

Machinists who appreciate "better class" tools know that Armstrong Wrenches give better service and last longer. Best steel, accurate machining and heat treatment are the reasons.



The World's Standard
DOG & CLAMPS

Drop Forged

Suitable for every purpose. Whatever the requirement, there is an Armstrong Dog or Clamp that, in design, quality of material and expert workmanship, is best suited to that particular purpose.

DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. We recommend therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

Board Drop Hammer.

CHAMBERSBURG

Hammers-Power and Hydraulic Machinery

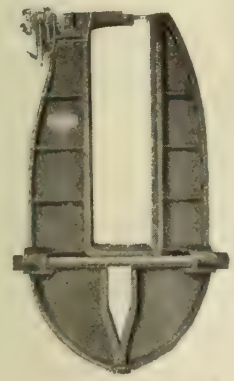
Steam Drop Hammer.

A quarter century of experience in the building of heavy machinery has enabled the CHAMBERSBURG ENGINEERING CO. to present designs which are adapted to meet the exacting requirements of the RAILROADS and the IRON and STEEL INDUSTRY. In addition to the machines pictured herewith, we standardize on the following equipment:—

Double Frame Steam Forging Hammer.

Single Frame Steam Forging Hammer.

HAMMERS FOR EVERY CLASS OF WORK
HYDRAULIC MACHINERY OF ALL TYPES
HYDRAULIC FORGING AND FLANGING PRESSES
HYDRAULIC AND POWER TRIMMING PRESSES
POWER PUNCHES AND SHEARS
CHAMBERSBURG PATENTED PUNCHES AND SHEARS embody a number of time and labor-saving features heretofore unknown in this class of machinery.

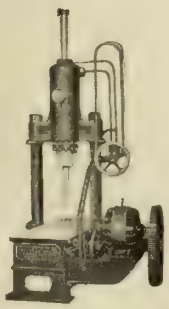


Hydraulic Riveter.

Trimming Press.

We are prepared to furnish machines to take care of your largest work—a few examples of heavy equipment that we have built:—

80,000 POUND STEAM FORGING HAMMER
20,000 POUND STEAM DROP HAMMER
5,000 POUND BOARD DROP HAMMER
10,000 TON HYDRAULIC FORGING PRESS



Hydraulic Forging and Bushing Press.

Literature sent upon request.

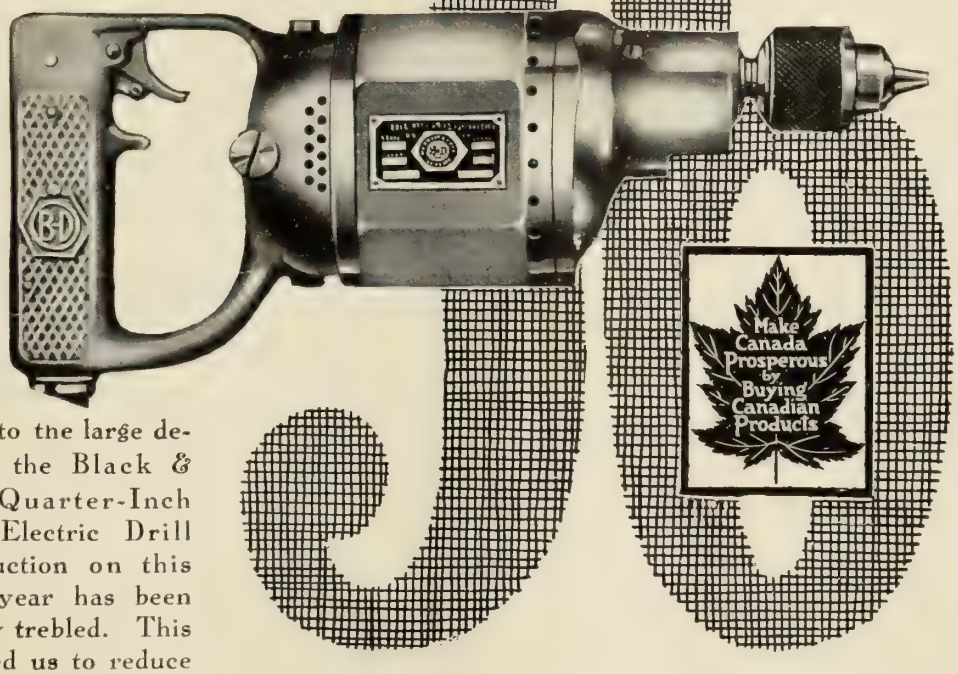
BLACK & DECKER

¼ inch PORTABLE ELECTRIC DRILL

"With the Pistol Grip and Trigger Switch"

Price reduced to
$36.00
was $49.00



Owing to the large demand for the Black & Decker Quarter-Inch Portable Electric Drill our production on this unit this year has been practically trebled. This has enabled us to reduce our manufacturing costs, and in accordance with our established policy we are passing the saving on to you.

This is the standard Black & Decker Quarter-Inch Drill, exactly the same as has previously been sold for $49.00 except that it has been improved by the addition of a geared-nut chuck instead of a hand operated chuck.

A new folder describing this unit in detail, INCLUDING SPECIFICATIONS, is yours for the asking.
